SARS-CoV-2 is a Culprit for Some, but not All Acute Ischemic Strokes

A Report from the Multinational COVID-19 Stroke Study Group

SUPPLEMENTAL DOCUMENT 2. DETAILED DESCRIPTION OF THE CLUSTERING

The patients were clustered based on the laboratory findings and comorbidities. We used clinicians' EXpert opinion (EX models), or unsupervised Machine Learning algorithms (ML models) for defining the clusters. The results of different models were compared through the contingency matrix (a.k.a contingency table).³ The models for clustering the patients based on the comorbidities are as follows:

A. Clinical Risk Scoring Models Based on the EXpert opinion (EX models)

Patients were categorized based on the number of the existing comorbidities. We either considered All eleven comorbidities (EX-A models; including hypertension, diabetes mellitus, ischemic heart disease, atrial fibrillation, carotid stenosis, chronic kidney disease, cardiac ejection fraction less than 40%, active neoplasm, rheumatological diseases, history of transient ischemic attack or stroke, and current smoking), or Selectd number of vascular comorbidities (EX-S models; including hypertension, diabetes mellitus, ischemic heart disease, atrial fibrillation, carotid stenosis, chronic kidney disease, previous transient ischemic attack or stroke, and current smoking). We further clustered the patients under each of these models to two (EX-A₂ and EX-S₂) or three (EX-A₃ and EX-S₃) subgroups.

1. EX-A₂: based on expert opinion and including all comorbidities, in two subgroups.
 - a. Subgroup a: zero or one comorbidity,
 - b. Subgroup b: more than one comorbidity.
2. EX-S₂: based on expert opinion and including selected comorbidities, in two subgroups.
 - a. Subgroup a: zero or one comorbidity,
 - b. Subgroup b: more than one comorbidity.
3. EX-A₃: based on expert opinion and including all comorbidities, in three subgroups.
 - a. Subgroup a: zero comorbidity,
 - b. Subgroup b: one or two comorbidities,
 - c. Subgroup c: more than two comorbidities.
4. EX-S₃: based on expert opinion and including selected comorbidities, in three subgroups.
 - a. Subgroup a: zero comorbidity,
 - b. Subgroup b: one or two comorbidities,
 - c. Subgroup c: more than two comorbidities.

B. Models Based on Machine Learning Algorithms (ML models)

We used unsupervised machine learning algorithms for clustering. Hierarchical (complete linkage method) and K-means (Hartigan-Wong algorithm) clustering (ML-K models) and Spectral clustering (ML-S models) were used. We grouped the patients into two (ML-K₂ and ML-S₂), three (ML-K₃ and ML-S₃), four (ML-K₄ and ML-S₄), and five (ML-K₅ and ML-S₅) clusters.

B1: Hierarchical and k-mean clustering

1. ML-K₂: Based on hierarchical and K-means clustering, dividing the patients into two subgroups.
2. ML-K₃: Based on hierarchical and K-means clustering, dividing the patients into three subgroups.
3. ML-K₄: Based on hierarchical and K-means clustering, dividing the patients into four subgroups.
4. ML-K₅: Based on hierarchical and K-means clustering, dividing the patients into five subgroups.

B2: Spectral clustering

1. ML-S₂: Based on spectral clustering, dividing the patients into two subgroups.
2. ML-S₃: Based on spectral clustering, dividing the patients into three subgroups.
3. ML-S₄: Based on spectral clustering, dividing the patients into four subgroups.
4. ML-S₅: Based on spectral clustering, dividing the patients into five subgroups.

SUPPLEMENTAL TABLE 1. DIVIDING THE SARS-CoV-2 INFECTED ACUTE ISCHEMIC STROKE PATIENTS INTO 4 AND 5 SUBGROUPS BASED ON K-MEAN CLUSTERING

The table shows the structure of the models for grouping the patients into 4 and 5 subgroups using machine learning (ML) models (K-Mean) by considering the present comorbidities. ML-S₄ used spectral clustering to divide the patients into 4 groups while ML-S₅ separated the patients into 5 subgroups.

	Machine Learning Algorithm, K-Mean										
	ML-K ₄ (K-Mean)					ML-K ₅ (K-Mean)					
	a N= 74 (25.3%)	b N= 95 (32.5%)	c N= 62 (21.2%)	d N= 61 (20.9%)	P-Value	a N= 85 (29.1%)	b N= 39 (18.8%)	c N= 55 (18.8%)	d N= 49 (16.8%)	e N=64 (21.9%)	P-Value

ML-K₂: machine learning model using K-mean, dividing the patients into 2 subgroups; ML-S₂: machine learning model using spectral, dividing the patients into 2 subgroups; ML-K₃: machine learning model using K-mean, dividing the patients into 3 subgroups; ML-S₃: machine learning model using spectral, dividing the patients into 3 subgroups. Please note a, b, and c in this table are not based on the number of comorbidities and just indicated a distinct subgroup detected by unsupervised algorithms. Due to missingness, we provided the valid percentages in this table.

SUPPLEMENTAL FIGURE 1. CONTINGENCY MATRICES

Supplemental Figure 1. The similarity of methods under different clustering models when grouping the patients with acute ischemic stroke into 2 and 3 subgroups. In models based on expert opinion (EX), EX-A included all 11 collected comorbidities and EX-S included 8 selected comorbidities. Patients were then clustered into two subgroups (EX-A₂ and EX-S₂), with “0” referring to patients with zero or one comorbidities and “1” referring to patients with >1 comorbidity, or three subgroups (EX-A₃ and EX-S₃), with “0” referring to patients without any known comorbidity, “1” referring to patients with one or two comorbidities, and “2” referring to patients with >2 comorbidities. In machine learning algorithms (ML) ML-K used hierarchal clustering and K-means, while ML-S used spectral clustering. Within each clustering, method patients were grouped into two (ML-K₂ and ML-S₂) and three (ML-K₃ and ML-S₃) clusters. Panel A shows the similarity between the 2 subgroups in EX-A₂ and ML-K₂. Panel B shows the similarity between the 2 subgroups in EX-A₂ and ML-S₂. Panel C shows the similarity between the 3 subgroups in EX-A₃ and ML-K₃. Panel D shows the similarity between the 3 subgroups in EX-A₃ and ML-S₃. Panel E shows the similarity between the 2 subgroups in EX-S₂ and EX-A₂. Panel F shows the similarity between the 2 subgroups in ML-S₂ and ML-K₂. Panel G shows the similarity between the 2 subgroups in EX-S₂ and ML-K₂. Panel H shows the similarity between the 2 subgroups in EX-S₂ and ML-S₂. Panel I shows the similarity between the 3 subgroups in EX-S₃ and ML-K₃. Panel J shows the similarity between the 3 subgroups in EX-S₃ and ML-S₃. Panel K shows the similarity between the 3 subgroups in EX-S₃ and EX-A₃. Panel L shows the similarity between the 3 subgroups in ML-S₃ and ML-K₃.
