

Supplementary Figure: Representative Flow Cytometry Staining for intracellular cytokine analysis (a) and MHC-multimer analysis (b). T cells (a) or PBMC (b) were first gated in lymphocytes, followed by double and non-viable cell exclusion. Cells were then gated on CD8+CD4- cells, followed by assessment of either IFN-gamma (a) or MHC-Multimer (CLG, FLY, YLL, YLQ) and PD-1 (b) in CD8+ T cells.
