Supplement Table 3. Multivariable hazard ratios (HR) and 95% confidence intervals (CI) per standard deviation (SD) for 138 proteins in relation to all-cause mortality in two random samples of the MDCS-CVA (n=3,918). Multivariable analyses adjusted for age, sex, smoking status, BMI, educational level, history of hypertension, prevalent diabetes mellitus, C-reactive protein (ln-transformed), HbA1c (ln-transformed), and LDL-cholesterol. Proteins with a nominally significant association with all-cause mortality ($P<0.05$) in one (light grey) or both (dark grey) random samples are highlighted.

Selected proteins based on the random survival forest backward algorithm. In total, 49 and 30 proteins were retained in random sample 1 and 2, respectively.

RSF model including covariates and all 138 proteins.

RSF models in full study population including covariates only, all proteins and a model including covariates and proteins retained using the RSF backward algorithm in both random samples (21 proteins; FABP4, FasL, GDF15, HE4, HGF, IL12, IL6, mAmP, MMP1, MMP12, MYD88, NTproBNP, PRSS8, PSGL1, PTPN22, PTX3, RAGE, REN, SCF, THPO, TIM).

Supplement Figure 8. Heat map of Pearson correlation coefficients (a) and pathway analysis (b) for the top eight proteins associated with all-cause mortality in the MDCS-CVA. The pathway analysis was performed using the STRING database Version 11.0. Nodes represent proteins and edges represent protein-protein associations. All sources of interactions were probed and minimum required interaction score was set at low confidence (0.150). No known interactions (curated or experimental) were identified. Green edges represent connections by textmining and black edges represent putative co-expression. Abbreviations from the STRING database were used in the pathway analysis. Abbreviations: AREG – amphiregulin (AREG), WFDC2 – epididymal secretory protein E4 (HE4), PLAUR – urokinase plasminogen activator surface receptor (UPAR), GH1 – growth hormone (GH), NPPB – N-terminal pro-B-type natriuretic peptide (NTproBNP), CXCL9 – C-X-C motif chemokine 9 (CXCL9), KITLG – stem cell factor (SCF), GDF15 – growth/differentiation factor 15 (GDF15).

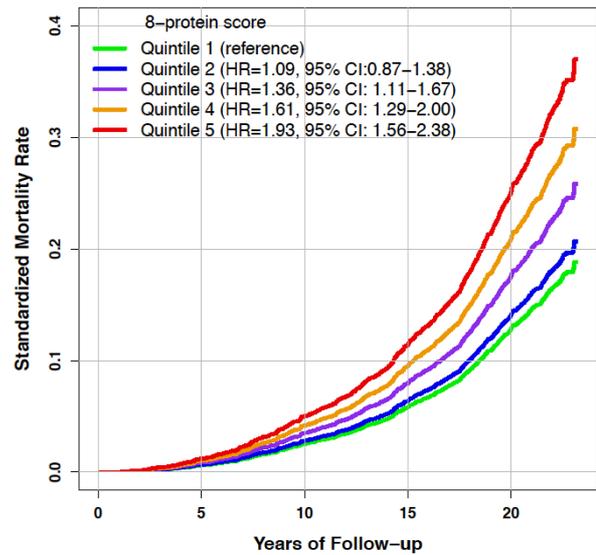

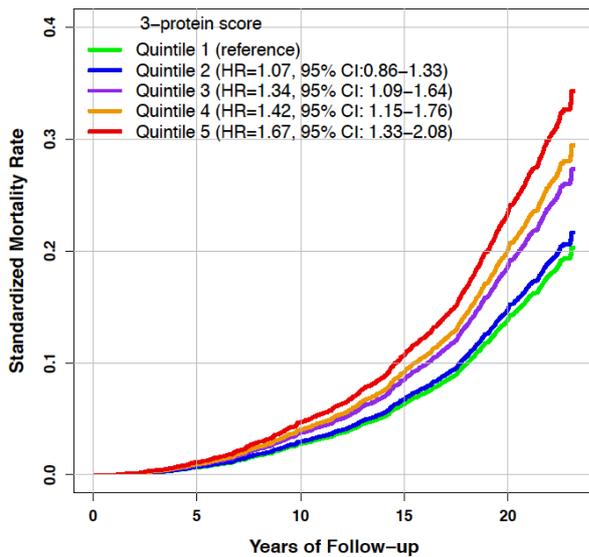

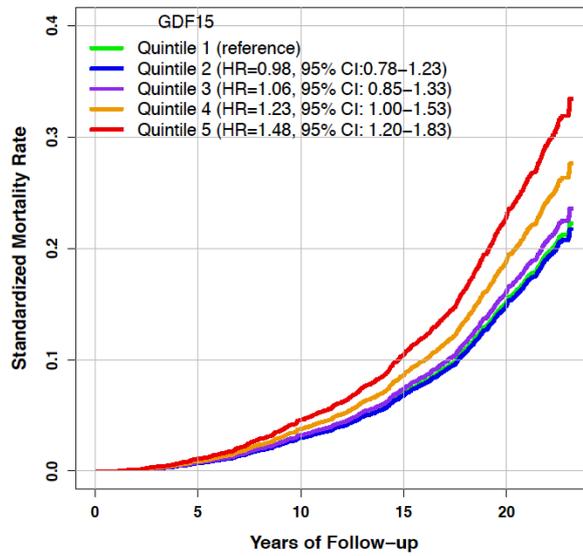

Supplement Table 5. Summary of proteins associated with all-cause mortality in two random samples of the MDCS-CVA using different methods. Proteins associated with all-cause mortality in only one random sample are denoted (+) and proteins associated with all-cause mortality in both random samples are denoted (++) . All analyses adjusted for age, sex, smoking status, BMI, educational level, history of hypertension, prevalent diabetes mellitus, C-reactive protein (ln-transformed), HbA1c (ln-transformed), and LDL-cholesterol.
