### **Reporting Summary**

Nature Research wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Research policies, see our Editorial Policies and the Editorial Policy Checklist.

For all statistical analyses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section

<u> </u>				
<b>⊆</b> t	· a	tic	:†1	CS

	an elastical analysis, some in that the remaining terms are presented in the regard regard, that is seen and the remaining terms are presented in the remaining terms are presented in the remaining terms.
n/a	Confirmed
	$oxed{\boxtimes}$ The exact sample size (n) for each experimental group/condition, given as a discrete number and unit of measurement
	🔀 A statement on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly
	The statistical test(s) used AND whether they are one- or two-sided  Only common tests should be described solely by name; describe more complex techniques in the Methods section.
$\boxtimes$	A description of all covariates tested
	🔀 A description of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons
$\boxtimes$	A full description of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) AND variation (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)
	For null hypothesis testing, the test statistic (e.g. <i>F</i> , <i>t</i> , <i>r</i> ) with confidence intervals, effect sizes, degrees of freedom and <i>P</i> value noted <i>Give P values as exact values whenever suitable.</i>
$\boxtimes$	For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings
$\boxtimes$	For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes
$\boxtimes$	$\square$ Estimates of effect sizes (e.g. Cohen's $d$ , Pearson's $r$ ), indicating how they were calculated

#### Our web collection on <u>statistics for biologists</u> contains articles on many of the points above.

#### Software and code

Policy information about <u>availability of computer code</u>

Data collection

All data sources and packages and their usage are described in the Methods with the corresponding versions and references (including NCBI, KEGG and JGI GOLD). New code used here consisted of batch subroutines to run multiple collections at once. No new software was developed for this purpose.

Data analysis

All packages used for data analysis are described in the methods with the corresponding versions and references (including BLAST, EMBOSS, MAFFT, RAxML, MCL, MAD, ETE3, PastML and Cytoscape). New code used here consisted of batch subroutines to run multiple analyses at once, calculations and statistical analysis as thoroughly described in the Methods. No new software was developed for this purpose.

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors and reviewers. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Research guidelines for submitting code & software for further information.

#### Data

Policy information about <u>availability of data</u>

All manuscripts must include a data availability statement. This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A list of figures that have associated raw data
- A description of any restrictions on data availability

Sequence data that supports the findings of this study is available in NCBI RefSeq (GCF identifiers are provided in Supplementary Table 1). Metabolic data is available in KEGG. Phylogenetic trees and other relevant data are provided in Supplementary Datasets.

ricase serect tire o	ne below that is the best fit for your research. If you are not sure, read the appropriate sections before making your selection.

Life scier	nces study design	
	sclose on these points even when the disclosure is negative.	
Sample size	All bacterial genomes from NCBI, RefSeq version September 2016 were collected for the initial analysis, and those 1089 classified as anaerobic were retained for further analysis.	
Data exclusions	No data was excluded from the analysis.	
	All attempts at replication were successful.	
Replication	An attempts at replication were successful.	
Replication Randomization	No experimental groups were used in this study and therefore randomization does not apply.	

## Reporting for specific materials, systems and methods

We require information from authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material, system or method listed is relevant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.

Materials & experimental systems		Methods	
n/a	Involved in the study	n/a	Involved in the study
$\times$	Antibodies	$\boxtimes$	ChIP-seq
$\boxtimes$	Eukaryotic cell lines	$\boxtimes$	Flow cytometry
$\boxtimes$	Palaeontology and archaeology	$\boxtimes$	MRI-based neuroimaging
$\boxtimes$	Animals and other organisms		
$\boxtimes$	Human research participants		
$\times$	Clinical data		
$\boxtimes$	Dual use research of concern
