Supplementary Fig. 1. Phenotypes of *Drosophila* expressing C2C10H and CHCHD10. (a) Phylogenetic tree for CHCHD2 and CHCHD10. The genetic tree was generated with Phylogeny.fr. (**b** and **c**) Degenerative eye quantification shown in Fig. 1b and Fig. 1c, respectively. Boxes indicate medians and 25th and 75th percentiles. Bars indicate the highest and lowest values (two-sided t-test, p = 0.0448 (Fig. 1b) and 0.0291 (Fig. 1c); n = 4 flies from 2 independent experiments (Fig. 1b) and n=5 flies from 2 independent experiments (Fig. 1c)). Note that p-scores cannot be directly compared between Fig. 1b and Fig. 1c (see Methods). The pscores of normal GMR-GAL4 for Fig. 1b and Fig. 1c were 23.12 ± 1.5 (n = 5) and 46.37 ± 3.8 (n= 7), respectively. (d) FLAG-tagged $C2C10H^{S81L}$ causes age-dependent rough eye phenotypes in 40-day-old flies. Boxes indicate medians and 25th and 75th percentiles. Bars indicate the highest and lowest values (two-sided *t*-test, **p = 0.0023; n = 5 for each group). Scale bar = 200 µm. (e) Proteins extracted from heads expressing FLAG-tagged C2C10H WT, S81L (upper) and FLAGtagged CHCHD10 WT and S59L (lower) by GMR-GAL4 and immunoblotting with anti-FLAG and anti-actin antibodies was performed. Data are mean \pm SD (two-sided *t*-test, N.S., not significant; n = 3 independent experiments). (f) Expression from third chromosome homozygous $C2C10H^{S81L}$ at the attp2 site (homozygote) causes a severe rough eye phenotype at eclosion. Scale bar = 200 μ m. (g) To confirm the increased expression of C2C10H^{S81L} protein via transvection, proteins were extracted from heads, and immunoblotting was conducted with anti-FLAG and anti-actin antibodies. As shown and quantified, fly eyes carrying two homozygous copies of C2C10H^{S81L} at the attp2 site (GMR/+;S81L/S81L) expressed a significantly higher amount of C2C10H than fly eyes carrying two heterozygous copies of C2C10H^{S81L} at the attp40 and attp2 site (GMR/S81L;S81L/+). However, fly eyes carrying two heterozygous copies of C2C10H^{S81L} (GMR/S81L;S81L/+) expressed approximately twice the amount of C2C10H than

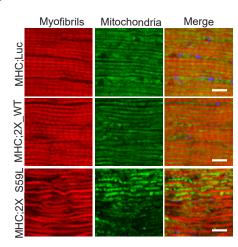

fly eyes carrying one copy of $C2C10H^{S81L}$ (GMR/+;S81L/+) as expected. Data are mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 8.005e-05; n = 5). (**h**) Expression of *CHCHD10*^{S59L} in motor neurons results in defective locomotive activity. The locomotive activity was assessed by the crawling distance of third-instar larvae. Data are mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 8.2e-06; n = 18).

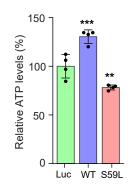

С

Supplementary Fig. 2 Expression of CHCHD10^{WT} and CHCHD10^{S59L} constructs in HeLa and HeLa^{YFP-Parkin} cells, the aggregate formation of C2C10H^{S81L} and CHCHD10^{S59L}, and mitochondrial defects caused by CHCHD10^{S59L} in Drosophila muscle. (a) Expression of FLAG-tagged CHCHD10^{WT} and CHCHD10^{S59L} in HeLa and HeLa^{YFP-Parkin} cells. HeLa cells were transiently transfected and subjected to immunoblotting with anti-FLAG and anti-actin antibodies. Data are mean \pm SD (two-sided *t*-test, N.S., not significant; n = 3 independent experiments). (b) Indirect flight muscles from 10-day-old MHC-GAL4>UAS-2X_C2C10H^{WT} and 2X_C2C10H^{S81L} male flies were immunostained with streptavidin–Alexa Fluor 488 (green) and anti-FLAG antibody (red) to visualize mitochondria and C2C10H^{WT} or C2C10H^{S81L}, respectively. Representative images from 2 independent experiments with 9 flies are shown. Scale bar = 20 μ m. (c) Indirect flight muscles from 20-day-old *MHC*-GAL4>*UAS*-CHCHD10^{WT} and CHCHD10^{S59L} males were immunostained with streptavidin–Alexa Fluor 488 (green) and anti-FLAG antibody (red) to visualize mitochondria and CHCHD10^{WT} or CHCHD10^{S59L}. respectively. Scale bar = $20 \mu m$. (d) Muscular and mitochondrial morphology of 20-day-old CHCHD10^{WT}- and CHCHD10^{S81L}-expressing flies. Indirect flight muscles were stained with streptavidin–Alexa Fluor 488 (mitochondria, green) and phalloidin–Alexa Fluor 594 (actin filaments, red). Representative images from 2 independent experiments with 10 flies are shown. ATP levels in thoraxes containing muscle tissues of the indicated genotypes (aged 20 days) were measured. Data shown are mean ± SD (one-way ANOVA and posthoc Dunnett test, two-sided, ***p = 0.00097 and **p = 0.00821; n = 4 independent experiments). Scale bar = 10 μ m.

Supplementary Fig. 3 Co-expression of CHCHD10^{WT} and CHCHD10^{S59L} in Drosophila and HeLa cells. (a) Eye phenotypes of various control lines in the 2X_C2C10H^{S81L} background. GFP (B1512), p element-mediated insertion on second chromosome; GFPattp2, GFP inserted on attp2 site; B35785, TRiP mCherry RNAi control; V45688, VDRC GD RNAi line (ebony); V106080, VDRC KK RNAi line (yellow); and V60100, host line of KK lines. Representative images from 3 independent experiments are shown. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (one-way ANOVA and posthoc Dunnett test, twosided, *p = 0.02952; n = 5-8 for each group). Control lines carrying a transgene at the attp2 site showed slightly enhanced rough eyes due to transvection, but other control lines did not induce notable modification. Because GFP (B1512) showed a trend, although not statistically significant, for enhanced rough eye phenotypes, we measured CHCHD10 protein levels. As shown in (b and b'), only GFPattp2 inserted at the attp2 site increased CHCHD10 expression significantly. Scale bar = 200 μ m. (b) Proteins were extracted from the heads of w¹¹¹⁸, GFP, and GFPattp2 flies in the 2X_C2C10H^{S81L} background, and then immunoblotting was performed with anti-FLAG and anti-actin antibodies (arrow and arrowhead indicate S81L and non-specific bands, respectively). Data are mean \pm SD (one-way ANOVA and *posthoc* Dunnett test, twosided, ***p = 3.4e-05; n = 3 independent experiments). (c) HeLa cells were co-transfected with FLAG-tagged CHCHD10^{S59L} and CHCHD10^{WT}. Empty vector (EV) was used as a control. After 24 hours, mitochondrial respiration for each group was measured by Seahorse XF Cell Mito Stress tests. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 8 independent experiments (one-way ANOVA and *posthoc* Dunnett test, two-sided, ****p* = 8.01e-10, 7.52e-08, 2.38e-06 and 0.000156 for basal, maximal, ATP and spare level, respectively; detailed information on statistical analyses is

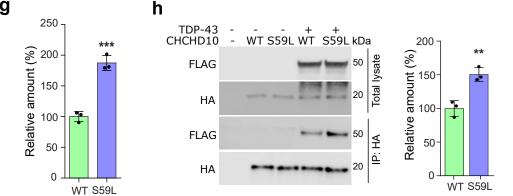

available in Supplementary Fig. 9d). (d) Expression of $C2C10H^{WT}$ inserted in the VK27 site also improved $C2C10H^{S81L}$ -induced rough eye phenotypes, whereas insertion of $C2C10H^{S81L}$ in the VK27 site exacerbated the phenotypes. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (n = 2 from a single experiment). Scale bar = 200 µm. (e). Expression of human $CHCHD10^{WT}$ mitigated $C2C10H^{S81L}$ -induced rough eye phenotypes. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (two-sided *t*-test, ***p = 2.04e-05, n = 7-10 flies from 2 independent experiment). Scale bar = 200 μ m. (f) Lysates from HeLa cells, three *CHCHD10^{KO}* HeLa cell lines, two CHCHD2/CHCHD10 double knockout HeLa cell lines (C2/C10 DKO) were immunoblotted with anti-CHCHD10 and anti-CHCHD2 antibodies and immunostained. Representative images from 3 independent experiments are shown. Scale bar = $20 \mu m$. (g). Mitochondrial respiration of normal HeLa, CHCHD10^{KO} HeLa, and CHCHD2/10^{DKO} HeLa cell lines was measured by Seahorse XF Cell Mito Stress tests. Graphs of a single representative experiment were shown (mean \pm SD). Actual statistical analyses were performed with 3 independent experiments (twosided t-test; detailed information on statistical analyses is available in Supplementary Fig. 9e). (h) EV, FLAG tagged *CHCHD10^{WT}*, and *CHCHD10^{S59L}* were transfected to *CHCHD10^{KO}* HeLa and CHCHD2/10^{DKO} HeLa cell lines. Mitochondrial respiration of CHCHD10^{KO} HeLa and CHCHD2/10^{DKO} HeLa cell lines was measured by Seahorse XF Cell Mito Stress tests. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 3 independent experiments (one-way ANOVA and *posthoc* Dunnett test, twosided, Basal: **p = 0.0027, ***p = 3.9e-07 in C10 KO and ***p = 3.0e-07 in C2/C10 DKO; Maximal: *p = 0.0177, ***p = 6.4e-05 in C10 KO and ***p = 2.3e-06 in C2/C10 DKO; Spare

respiratory capacity: *p = 0.0203 for WT, 0.0287 for S59L in C10 KO, ***p = 8.5e-05 in C2/C10KO; detailed information on statistical analyses is available in Supplementary Fig. 9b, c).

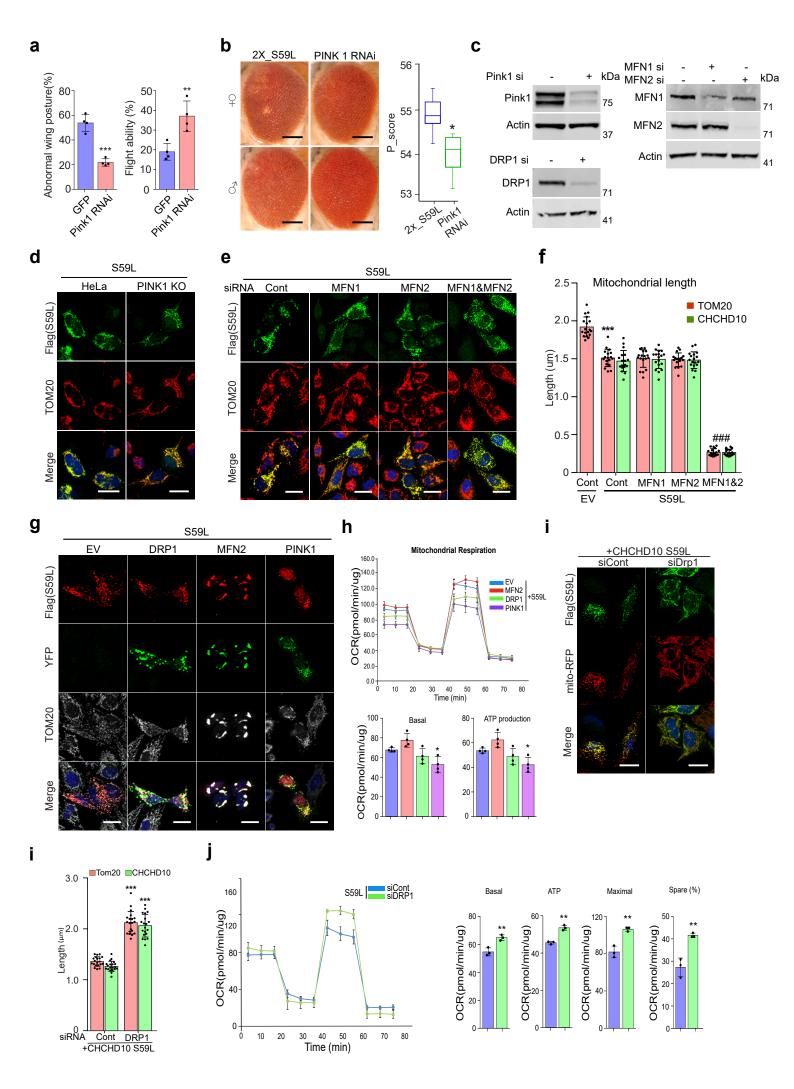

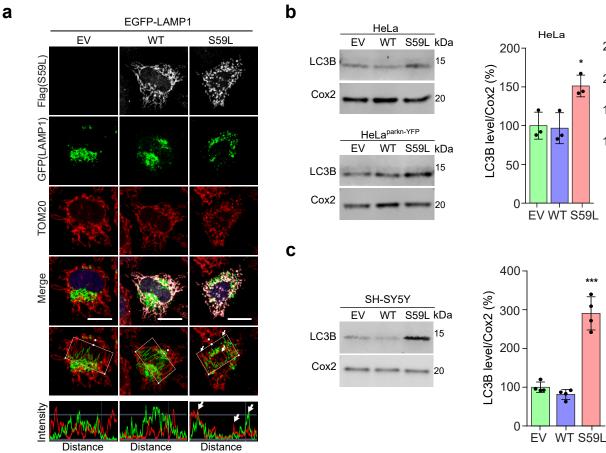

Supplementary Fig. 4 Mitochondrial localization and functional effects of TDP-43 in Drosophila and human cells. (a) The intrinsically disordered region of CHCHD10 was predicted by PONDR. (b) HeLa cells were co-transfected with FLAG-tagged TARDBP and HAtagged CHCHD10^{WT} or CHCHD10^{S59L}. After 24 hours, cells were stained with anti-FLAG and anti-HA antibodies. Arrows indicate mitochondrial localization of TDP-43. Representative images from 2 independent experiments are shown. Scale bar = $20 \mu m$. (c) SH-SY5Y cells were transfected with FLAG-tagged CHCHD10^{WT} or CHCHD10^{S59L}. Cells were stained with anti-FLAG and anti-TDP-43 antibodies. Note that endogenous TDP-43 is highly distributed in mitochondria and cytoplasm of CHCHD10^{S59L}-transfected cells compared to those of empty vector (EV), WT-transfected cells. Arrows indicate TDP-43 co-localized with mitochondria. Representative images from 4 independent experiments are shown. Scale bar = $10 \mu m$. (d) SH-SY5Y cells were transfected with FLAG-tagged CHCHD10^{WT} or CHCHD10^{S59L}. After 48 hours, mitochondria were isolated. Immunoblotting was conducted with anti-TDP-43 and anti-Cox2 antibodies. Data are shown mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 0.0002, compared to empty vector (EV) control; n = 3 independent experiments). (e) Normal flies and humanized TDP-43 humanized flies were analyzed by immunoblot with anti-TDP-43 antibodies to confirm the expression of human TDP-43 in the humanized TDP-43 flies (left panel). Indirect flight muscles from flies expressing C2C10H^{WT} or C2C10H^{S81L} with human TDP-43 replacing the entire coding region of *TBPH*. Tissues were immunostained with streptavidin–Alexa Fluor 488 (green) and anti-TDP-43 antibody (red). Co-localization was measured by Mander correlation coefficient. Data are shown mean \pm SD (two-sided *t*-test, ****p* = 1.41e-07; n = 10). Scale bar = 20 μ m. (f) Mitochondrial respiration was measured by Seahorse XF Cell Mito Stress tests. Graphs of a single representative experiment are shown (mean \pm SD).

Actual statistical analyses were performed with 4 independent experiments (one-way ANOVA and *posthoc* Dunnett test, two-sided, *p = 0.0162, **p = 0.0064; detailed information on statistical analyses is available in Supplementary Fig. 9f). (**g**) Quantification of Fig. 4i (two-sided *t*-test, ***p = 0.000523; n = 3 independent experiments). (**h**) HEK293T cells were transfected with/without *TDP-43-FLAG* and *CHCHD10^{WT}-HA* or *CHCHD10^{S59L}-HA*. After 24 hours, lysates were subjected to co-immunoprecipitation with anti-HA affinity gel, and immunoblotting was performed with anti-HA (CHCHD10) and anti-FLAG (TDP-43) antibodies. Note that CHCHD10^{S59L} protein binds TDP-43 more greatly than CHCHD10^{WT} protein (two-sided *t*-test, **p = 0.004873; n = 3 independent experiments).

Supplementary Fig. 5 Role of the PINK1/parkin pathway on the CHCHD10^{S59L}-induced phenotype. (a) Downregulation of *PINK1* mitigated abnormal wing postures and locomotor defects assessed by flight ability. Data are mean \pm SD (two-sided *t*-test, ****p* = 0.00013, ***p* = 0.0062; n = 4, with > 40 flies for each group). (b) RNAi-mediated knockdown effect of *PINK1* on human CHCHD10^{S59L}-induced eye phenotypes. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (two-sided *t*-test, *p = 0.0226; n = 8flies from 3 independent experiments). Scale bar = $200 \mu m$. (c) HeLa cells were transfected with siRNAs targeting PINK1, DRP1, MFN1, or MFN2 or control siRNA. Immunoblotting confirmed the successful knockdown of target genes. Representative images from 3 independent experiments are shown. (d) HeLa cells and PINK1KO HeLa cells were transfected with FLAGtagged CHCHD10^{S59L} or empty vector (EV). Representative images (single experiments) of transfected HeLa cells were immunostained with antibodies against FLAG (green, CHCHD10) and TOM20 (red, mitochondria). Scale bar = $20 \mu m$. (e) HeLa cells were transfected with siRNAs targeting MFN1 and/or MFN2. The cells were transfected with FLAG-tagged CHCHD10^{S59L} 24 hours after siRNA transfection. Representative images (3 independent experiments) of transfected HeLa cells immunostained with antibodies against FLAG (green, CHCHD10) and TOM20 (red, mitochondria). Scale bar = $20 \mu m$. (f) Quantification of TOM20 and CHCHD10^{S59L}-FLAG signal length. Data shown are mean ± SD (one-way ANOVA and Tukey-Kramer test, two-sided, ***p < 2e-16 vs. EV; n = 18-20 cells from 3 independent experiments; $\#\#p < 2e-16 vs. CHCHD10^{S59L}$ control (Cont) cells). (g) HeLa cells were cotransfected with YFP-tagged DRP1, MFN2, or PINK1 and FLAG-tagged CHCHD10^{S59L}. Transfected HeLa cells were immunostained with an antibody against FLAG (red, CHCHD10) and TOM20 (gray, mitochondria). Representative images (single experiment) are shown. Scale

 $bar = 20 \mu m$. (h) Mitochondrial respiration was measured by Seahorse XF Cell Mito Stress tests 24 hours after transfection. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 6 independent experiments (one-way ANOVA and *posthoc* Dunnett test, two-sided, *p = 0.0235 for basal level and 0.0293 for ATP production; detailed information on statistical analyses is available in Supplementary Fig. 9h). (i) HeLa cells were transfected with a siRNA targeting DRP1. After 18 hours of siRNA transfection, the cells were transfected with FLAG-tagged CHCHD10^{S59L}. Representative images (3 independent experiments) of transfected HeLa cells immunostained with antibodies against FLAG (green, CHCHD10) and TOM20 (red, mitochondria). Quantification of TOM20 and CHCHD10^{S59L}-FLAG signal length. Green CHCHD10^{S59L} signals are spread across mitochondria. Data shown are mean \pm SD (two-sided *t*-test, ***p = 8.32e-17 for Tom20 and 3.72e-17 for CHCHD10 vs. EV; n = 20 cells from 3 independent experiments). Scale bar = $20 \mu m$. (j) Mitochondrial respiration was measured by Seahorse XF Cell Mito Stress tests 24 hours after transfection. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 3 independent experiments (two-sided, *t*-test, **p = 0.00753, 0.00312, 0.00689 and 0.0045 for basal, maximal, ATP and spare (%), respectively; detailed information on statistical analyses is available in Supplementary Fig. 9i).

Supplementary Fig. 6 Effect of CHCHD10^{S59L} on mitophagy. (a) HeLa cells were transfected with EGFP-LAMP1 and FLAG-tagged CHCHD10^{S59L}. After 24 hours of transfection, cells were immunostained with antibodies against FLAG and TOM20. Graphs show the fluorescence intensity profiles of EGFP-LAMP1 and TOM20 along the regions boxed in white. Arrows indicate highly LAMP1-S59L merged regions. Representative images from 2 independent experiments are shown. Scale bar = $20 \mu m$. (b) HeLa, HeLa^{YFP-parkin,} and (c) SH-SY5Y cells were transfected with CHCHD10^{WT} or CHCHD10^{S59L}. After 48 hours, mitochondria were isolated. Immunoblotting was conducted with anti-LC3B and anti-Cox2 (loading controls) antibodies. Data shown are mean \pm SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, *p =0.0197, **p = 0.0054, ***p = 6.9e-06, compared to vector control; n = 3 independent experiments). (d) Quantification of Fig. 6i, j. Data shown are mean \pm SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, **p = 0.0065, ***p = 0.00013, compared to vector control; n =3 independent experiments, >30 cells were counted for each group). (e) SH-SY5Y cells were cotransfected with CHCHD10WT or CHCHD10S59L and Mito-QC. Cells with mito-lysosomes (GFP-/mCherry⁺) were analyzed. Data shown are mean \pm SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 1.5e-05, n = 3 independent experiments with ≥ 40 cells for each group). Scale bar = 10 μ m. (f) HeLa cells were transfected with siRNAs targeting *NDP52* or *OPTN* or control siRNA. Immunoblotting confirmed RNAi-mediated knockdown of target genes. Representative images from 2 independent experiments are shown. (g) HeLa cells and (h) HeLa^{YFP-Parkin} cells were transfected with siRNAs targeting NDP52 and/or and OPTN. Mitochondrial respiration was measured by Seahorse XF Cell Mito Stress tests at 24 hours after CHCHD10^{S59L} transfection. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 3 independent experiments. Data were

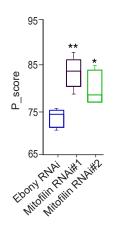

compared with one-way ANOVA and *posthoc* Dunnett test, two-sided, *p = 0.0129 (siOPTN), 0.0108 (siNDP52), ***p = 0.00015 (siOPTN/ siNDP52) in basal level, *p = 0.0479, **p = 0.0028 in maximal level, ***p = 0.00078 in ATP production, **p = 0.01385, *p = 0.00732 and ***p = 0.00016 in spare respiratory capacity. Detailed information on statistical analyses is available in Supplementary Fig. 9j, k.

Supplementary Fig. 7 Mitigation of CHCHD10^{S59L}-induced toxicity by inhibiting PINK1 activity. (a) Overexpression of nonphosphorylatable *mitofilin* partially rescued C2C10H^{S81L}induced rough eye phenotypes. Interestingly, overexpression of WT mitofilin cause mixed effects on eye degeneration, slightly better in anterior regions but much worse in posterior regions. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 0.00085; n = 5-6for each group from 3 independent experiments). Scale bar = $200 \,\mu\text{m}$. (b) RNAi-mediated knockdown of *Mitofilin* enhanced the C2C10H^{S81L} phenotype. Ebony RNAi, V45688; Mitofilin RNAi #1, V47616; Mitofilin RNAi #2, V47615. Boxes indicate median and 25th and 75th percentiles, and bars indicate the highest and lowest values (one-way ANOVA and *posthoc* Dunnett test, two-sided, **p = 0.0017, *p = 0.0369; n = 5-6 from 3 independent experiments). Scale bar = $200 \,\mu\text{m}$. (c) Mitochondrial and CHCHD10 signal length were analyzed from $MFN2^{S378A}$ and $CHCHD10^{S59L}$ transfected cells. Data shown are mean \pm SD (two-sided *t*-test, ***p = 5.23e-10 for CHCHD10 and 1.9e-13 for Tom20; n = 20 cells from 3 independent experiments). (d) The effect of MFN2 agonists on mitochondrial and CHCHD10 signal length in HeLa cells expressing CHCHD10^{S59L}. Data shown are mean \pm SD (one-way ANOVA and posthoc Dunnett test, two-sided, ***p < 2e-16 for both B1 and B-A/l in Tom20, compared to DMSO; n = 20-21 cells from 3 independent experiments). (e) HeLa cells were transfected with FLAG-tagged CHCHD10^{S59L} and treated with the MFN2 agonists B1 (50 nM) or B-A/L (5 nM) for 24 hours. Mitochondrial respiration was measured with the Seahorse XF Cell Mito Stress test kit. Graphs of a single representative experiment are shown (mean \pm SD). Actual statistical analyses were performed with 4 independent experiments (one-way ANOVA and posthoc Dunnett test, two-sided, *p = 0.0948, ***p = 0.0004 for basal level, **p = 0.0047, ***p = 7.1e05 for maximal level, *p = 0.1457, **p = 0.0019 for ATP production; detailed information on statistical analyses is available in Supplementary Fig. 9i). (**f**) ATP levels in thoraxes from 10day-old flies expressing *C9orf72* with expanded GGGGCC repeats fed with MFN2 agonists (each 10 µM). DMSO (0.1%) was used as vehicle control. Data shown are mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p = 9.7e-06, 0.00014 in male, ***p = 2.8e-06, 0.00097 in female for B1 and B-A/L treatment, respectively; n = 4 independent experiments). (**g**) Effects of PINK1 inhibitors on mitochondrial length in HeLa cells expressing *CHCHD10*^{S59L}. Data shown are mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p < 2e-16 from all groups; n = 20-21 cells from 3 independent experiments). (**h**) HeLa cells were pretransfected for 24 hours with FLAG-tagged *CHCHD10*^{S59L} and then treated with the peptide inhibitors PINK1_490 (0.15 µg/ml) and Ub_60 (0.15 µg/ml). DMSO was used as vehicle control. Cells were visualized with antibodies against FLAG and TOM20. Data shown are mean ± SD (one-way ANOVA and *posthoc* Dunnett test, two-sided, ***p < 3e-16 for all groups; n =20 cells from 3 independent experiments). Scale bar = 20 µm.

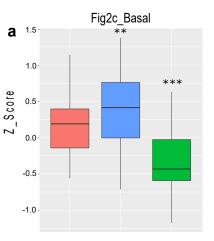

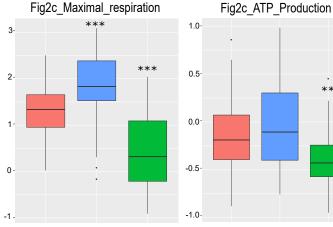

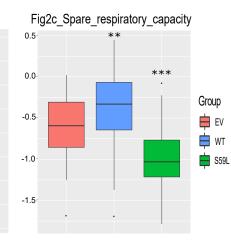

Supplementary Fig. 8 Effect of *CHCHD10* on CCCP-induced PINK1/parkin accumulation. (a) To titrate CCCP dosage for PINK1 accumulation, HeLa^{PINK1-V5-His} cells treated with multiple CCCP concentrations for 6 hours and then analyzed with a V5 antibody (red) and DAPI (blue). The percentage of PINK1-positive cells was calculated from the number of DAPI⁺ cells. For each sample, \geq 300 cells were counted from 3 independent experiments (two-sided *t*-test, ***p* = 0.0057, ****p* = 3.1e-05, 2.6e-14 for 5, 10 and 20 µM CCCP treated group, respectively). Scale bar = 100 µm. (b) HeLa^{YFP-Parkin} cells transfected with EV or FLAG-tagged *CHCHD10^{WT}* were treated with CCCP (10 µM) for 6 hours. Cells were analyzed with anti-FLAG (red) antibody, YFP (green), and DAPI (blue, nucleus) to visualize CHCHD10 and parkin proteins. Arrow indicates parkin accumulated in a nontransfected cell neighboring a *CHCHD10*-transfected cell (white dashed line) (two-sided *t*-test, ***p* = 0.00178; *n* = 3 independent experiments, with > 200 cells). Scale bar = 20 µm.

Supplementary Fig. 9 Statistical analyses of Seahorse assays. Z-Scores were calculated by using oxygen consumption rate (OCR) values from each plate. Z-Score = (OCR value – mean of OCR values)/standard deviation of OCR values. Boxes indicate medians and 25th and 75th percentiles. Bars indicate the highest and lowest values. (a–d, f–i, k) one-way ANOVA and *posthoc* Dunnett tests (two-sided) were used to test statistical significance. (e, j, l) Two-sided *t*-tests were used to test statistical significance. Detailed statistical value is listed in Supplementary table 3.

Fly Gene	Human Gene	Stock No. (RNAi or LOF)	Stock No. (UAS or Duplicate)	Note
