Supplementary Table 1. Binary logistic regression results predicting pharmacological treatment response in 6 months

Variables	B	p	Odds ratio (CI 95%)
ETI–physical subtype (total sum)	-0.343	0.004*	0.709 (0.562−0.895)
Level of education (high school or more)	0.954	0.020*	2.595 (1.161−5.800)
PDSS at baseline (total sum)	0.089	0.007*	1.093 (1.025−1.166)
Constant	-1.707	0.003	0.181

-2 log likelihood=177.051, χ^2 (df)=19.179(3) (p=0.000), Cox & Snell R^2=0.121, overall percentage=69.1%, reference group is the level of education (high school or more). *p<0.05. Criteria for treatment response: when the PDSS score at each time point is reduced by 40% or more compared to the PDSS score at the beginning of treatment, it is set as a treatment response. ETI: Early Traumatic Inventory, PDSS: Panic Disorder Severity Scale, CI: confidence interval
