

Appendices for American Gastroenterological Association Institute Technical Review on the Role of Probiotics in the Management of Gastrointestinal Disorders

Geoffrey A. Preidis,¹ Adam V. Weizman,² Purna C. Kashyap,³ Rebecca L. Morgan⁴

¹Section of Gastroenterology, Hepatology & Nutrition, Department of Pediatrics, Baylor College of Medicine and Texas Children’s Hospital, Houston, TX, USA; ²Division of Gastroenterology, Mount Sinai Hospital Department of Medicine, University of Toronto, Toronto, Ontario, Canada; ³Enteric Neuroscience Program, Division of Gastroenterology and Hepatology, Mayo Clinic, Rochester, MN, USA; ⁴Health Research Methods, Evidence and Impact, McMaster University, Hamilton, Ontario, Canada

Contents

Appendix 1: Should probiotics be used as part of the treatment of <i>Clostridioides difficile</i> infection?	9
Bibliography	9
Question: <i>Saccharomyces boulardii</i> compared to placebo/antibiotics in symptomatic patients with confirmed <i>C. difficile</i> infection (1a)	10
Question: <i>Lactobacillus plantarum</i> 299v compared to placebo/antibiotics in symptomatic patients with confirmed <i>C. difficile</i> infection (1b) ..	13
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo/antibiotics in symptomatic patients with confirmed <i>C. difficile</i> infection (1c)	17
Question: <i>Lactobacillus acidophilus</i> ATCC 700396 + <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> ATCC 335 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> ATCC SD5220 and ATCC SD5219 compared to placebo/antibiotics in symptomatic patients with confirmed <i>C. difficile</i> infection (1d)	19
Appendix 2: Should probiotics be used in the prevention of <i>Clostridioides difficile</i> -associated diarrhea?	22
Bibliography	22
Question: Probiotics compared to antibiotics alone or antibiotics + placebo in patients receiving antibiotic therapy for any indication with the exception of <i>C. difficile</i> infection (2a)	26
Outcomes stratified by species:	38
<i>C. difficile</i> -associated diarrhea	38
Incidence of infection	42
Adverse events	45

Incidence of antibiotic-associated diarrhea.....	49
Appendix 3: Should probiotics be used in patients with Crohn’s disease?	53
Bibliography	53
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo or standard of care or placebo + standard of care in patients with Crohn’s disease (3a).....	55
Question: <i>Escherichia coli</i> Nissle 1917 compared to placebo in patients with Crohn’s disease (3b)	59
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo +/- mesalamine in patients with Crohn’s disease (3c)	61
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 + maintenance therapy compared to placebo + maintenance therapy in patients with Crohn’s disease (3d).....	65
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 + mesalamine compared to mesalamine alone in patients with Crohn’s disease (3e)	67
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to mesalamine in patients with Crohn’s disease (3f)	69
Question: <i>Saccharomyces boulardii</i> compared to placebo +/- mesalamine alone in patients with Crohn’s disease (3g).....	71
Question: <i>Lactobacillus johnsonii</i> NCC 533 compared to placebo in prevention of endoscopic recurrence after surgery for Crohn’s disease (3h)	73
Appendix 4: Should probiotics be used in patients with ulcerative colitis?	75
Bibliography	75
Question: <i>Bifidobacterium breve</i> Yakult + <i>Bifidobacterium bifidum</i> Yakult + <i>Lactobacillus acidophilus</i> compared to placebo in patients with ulcerative colitis (4a).....	77
Question: <i>Bifidobacterium breve</i> Yakult + <i>Lactobacillus acidophilus</i> fermented milk compared to placebo in patients with ulcerative colitis (4b)	79
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to mesalamine alone in patients with ulcerative colitis (4c).....	81
Question: <i>Bifidobacterium longum</i> Reuter ATCC BAA-999 compared to placebo in patients with ulcerative colitis (4d)	85

Question: <i>Escherichia coli</i> Nissle 1917 compared to placebo +/- mesalamine in patients with ulcerative colitis (4e)	87
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to mesalamine in patients with ulcerative colitis (4f)	90
Question: <i>Lactobacillus reuteri</i> ATCC 55730 enema + meslamine compared to placebo + mesalamine in patients with ulcerative colitis (4g) ..	92
Question: <i>Lactobacillus acidophilus</i> LA-5 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> Bb12 compared to placebo in patients with ulcerative colitis (4h)	94
Question: <i>Enterococcus faecalis</i> T-110 + <i>Clostridium butyricum</i> TO-A + <i>Bacillus mesentericus</i> TO-A compared to placebo in patients with ulcerative colitis (4i)	96
Appendix 5: Should probiotics be used in patients with pouchitis?	98
Bibliography	98
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo / standard of care in patients with pouchitis (5a)	99
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo in patients with pouchitis (5b)	103
Question: <i>Clostridium butyricum</i> CBM 588 compared to placebo in patients with pouchitis (5c)	105
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> compared to placebo in patients with pouchitis (5d)	107
Appendix 6: Should probiotics be used to improve global response or abdominal pain severity in symptomatic children and adults with irritable bowel syndrome?	109
Bibliography	109
Question: <i>Saccharomyces boulardii</i> compared to placebo for adults with IBS (6a)	113
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo for adults with IBS (6b)	116
Question: <i>Escherichia coli</i> Nissle 1917 compared to placebo for adults with IBS (6c)	121
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo for children with IBS (6d)	123

Question: <i>Lactobacillus plantarum</i> 299v compared to placebo for adults with IBS (6e).....	126
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo for treatment if IBS in adults (6f).....	130
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo for children with IBS (6g)	132
Question: <i>Bacillus coagulans</i> MTCC 5856 compared to placebo for treatment of IBS (6h)	136
Question: <i>Lactobacillus reuteri</i> compared to placebo for adults with IBS (6i).....	139
Question: <i>Lactobacillus reuteri</i> DSM 17938 compared to placebo for children with IBS (6j).....	141
Question: <i>Lactobacillus gasseri</i> BNR17 compared to placebo for treatment of IBS (6k).....	142
Question: <i>Saccharomyces cerevisiae</i> CNCM I-3856 compared to placebo for treatment if IBS in adults (6l)	143
Question: <i>Lactobacillus casei</i> Shirota compared to placebo for adults with IBS (6m).....	149
Question: <i>Lactobacillus rhamnosus</i> compared to placebo for adults with IBS (6n).....	151
Question: <i>Lactobacillus acidophilus</i> SDC 2012 and 2013 compared to placebo for adults with IBS (6o).....	154
Question: <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> I-2494 + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> I-1630 + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> I-1632 and I-1519 compared to placebo for adults with IBS (6p)	156
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> F-19 + <i>Lactobacillus acidophilus</i> LA-5 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> Bb12 compared to placebo for adults with IBS (6q)	161
Question: <i>Escherichia coli</i> DSM 17252 compared to placebo for adults with IBS (6r).....	163
Question: <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Lactobacillus acidophilus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> compared to placebo for adults with IBS (6s)	165
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> LA-101 + <i>Lactobacillus acidophilus</i> LA-102 + <i>Lactococcus lactis</i> LA-103 + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> LA-104 compared to placebo for adults with IBS (6t)	168
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> NCC 3001 compared to placebo for adults with IBS (6u)	171
Question: <i>Lactobacillus rhamnosus</i> NCIMB 30174 + <i>Lactobacillus plantarum</i> NCIMB 30173 + <i>Lactobacillus acidophilus</i> NCIMB 30175 + <i>Enterococcus faecium</i> NCIMB 30176 compared to placebo for adults with IBS (6v)	175
Question: <i>Lactobacillus acidophilus</i> NCIMB 30157 and NCIMB 30156 + <i>Bifidobacterium bifidum</i> NCIMB 30153 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> NCIMB 30172 compared to placebo for adults with IBS (6w).....	180

Question: <i>Lactobacillus acidophilus</i> KCTC 11906BP + <i>Lactobacillus plantarum</i> KCTC 11867BP + <i>Lactobacillus rhamnosus</i> KCTC 11868BP + <i>Bifidobacterium breve</i> KCTC 11858BP + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> KCTC 11903BP + <i>Bifidobacterium longum</i> subsp. <i>longum</i> KCTC 11860BP + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> KCTC 11870BP compared to placebo for adults with IBS (6x)	182
Question: <i>Bifidobacterium bifidum</i> MIMBb75 compared to placebo for adults with IBS (6y)	185
Question: <i>Bifidobacterium animalis</i> subsp. <i>animalis</i> DN-173 + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> compared to placebo for adults with IBS (6z)	187
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> F-19 + <i>Lactobacillus acidophilus</i> LA-5 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> Bb12 + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo for adults with IBS (6aa)	189
Question: <i>Lactobacillus plantarum</i> CECT7484 and CECT7485 + <i>Pediococcus acidilactici</i> CECT7483 compared to placebo for adults with IBS (6ab)	191
Question: <i>Bifidobacterium longum</i> subsp. <i>infantis</i> M-63 + <i>Bifidobacterium breve</i> M-16V + <i>B. longum</i> Reuter ATCC BAA-999 compared to placebo for children with IBS (6ac)	193
Question: <i>Lactobacillus brevis</i> KB290 compared to placebo for adults and children with IBS (6ad).....	195
Question: <i>Lactobacillus casei</i> DG compared to placebo for adults with IBS (6ae).....	197
Question: <i>Lactobacillus acidophilus</i> NCFM + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> ATCC SD5220 compared to placebo for adults with IBS (6af)	198
Question: <i>Lactobacillus acidophilus</i> CL1285 + <i>Lactobacillus casei</i> LBC80R + <i>Lactobacillus rhamnosus</i> CLR2 compared to placebo for adults with IBS (6ag)	200
Question: <i>Bacillus subtilis</i> PXN 21 + <i>Bifidobacterium bifidum</i> PXN 23 + <i>Bifidobacterium breve</i> PXN 25 + <i>Bifidobacterium longum</i> subsp. <i>infantis</i> PXN 27 + <i>B. longum</i> subsp. <i>longum</i> PXN 30 + <i>Lactobacillus acidophilus</i> PXN 35 + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> PXN39 + <i>Lactobacillus casei</i> PXN 37 + <i>Lactobacillus plantarum</i> PXN 47 + <i>Lactobacillus rhamnosus</i> PXN 54 + <i>Lactobacillus helveticus</i> PXN 45 + <i>Lactobacillus salivarius</i> PXN 57 + <i>Lactococcus lactis</i> PXN63 + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> PXN 66 compared to placebo for adults with IBS (6ah)	202
Question: <i>Bifidobacterium bifidum</i> BGN4 + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> AD011 + <i>Lactobacillus acidophilus</i> AD031 + <i>Lactobacillus casei</i> IBS041 compared to placebo for adults with IBS (6ai)	205
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Lactobacillus acidophilus</i> compared to no probiotics for adults with IBS (6aj).....	207
Question: <i>Clostridium butyricum</i> compared to no probiotics for adults with IBS (6ak)	209

Question: <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> MG510 + <i>Lactobacillus plantarum</i> LRCC5193 compared to no probiotics for adults with IBS (6al)	211
Question: <i>Bacillus coagulans</i> Unique IS2 compared to no probiotics for children with IBS (6am)	213
Question: <i>Lactobacillus acidophilus</i> + <i>Lactobacillus rhamnosus</i> + <i>Bifidobacterium breve</i> + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to no probiotics for adults with IBS (6an). 215	
Question: <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> Bb12 + <i>Lactobacillus acidophilus</i> LA-5 + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> LBY-27 + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> STY-31 compared to no probiotics for adults with IBS (6ao)	217
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium bifidum</i> + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus rhamnosus</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to no probiotics for adults with IBS (6ap) ..	219
Question: <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> W52 + <i>Lactobacillus casei</i> W56 + <i>Lactobacillus salivarius</i> W57 + <i>Lactococcus lactis</i> W58 + <i>Lactobacillus acidophilus</i> ATCC 700396 + <i>Lactobacillus rhamnosus</i> W71 compared to placebo for adults with IBS (6aq)	221
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 and LC705 + <i>Bifidobacterium breve</i> Bb99 + <i>Propionibacterium freudenreichii</i> subsp. <i>shermanii</i> JS compared to placebo for adults with IBS (6ar)	223
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to no probiotics for children with IBS (6as)	224
Appendix 7: Should probiotics be used to reduce the duration or severity of diarrhea in children with acute infectious gastroenteritis?	226
Bibliography	226
Question: Probiotics compared to placebo and/or standard care alone for treatment of acute infectious diarrhea in children	233
Question: <i>Saccharomyces boulardii</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7a)	238
Question: <i>Lactobacillus rhamnosus</i> ATCC 53103 compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7b)	241
Question: <i>Lactobacillus acidophilus</i> compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7c)	246
Question: <i>Lactobacillus acidophilus</i> + <i>Bifidobacterium bifidum</i> compared to placebo for the treatment of acute infectious diarrhea in children (7d)	248
Question: <i>Lactobacillus reuteri</i> compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7e)	250

Question: <i>Lactobacillus helveticus</i> Rosell-52 + <i>Lactobacillus rhamnosus</i> Rosell-11 compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7f)	252
Question: <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> compared to placebo for treatment of acute infectious diarrhea in children (7g)	255
Question: <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7h).....	257
Question: <i>Enterococcus faecium</i> SF68 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7i).....	259
Question: <i>Escherichia coli</i> Nissle 1917 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7j).....	261
Question: <i>Bacillus mesentericus</i> + <i>Clostridium butyricum</i> + <i>Enterococcus faecalis</i> compared to placebo/standard of care for treatment of acute infectious diarrhea in children (7k).....	263
Question: <i>Lactobacillus acidophilus</i> + <i>Lactobacillus rhamnosus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Saccharomyces boulardii</i> compared to placebo for treatment of acute infectious diarrhea (7l).....	265
Question: <i>Lactobacillus rhamnosus</i> 19070-2 + <i>Lactobacillus reuteri</i> DSM 12246 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7m).....	267
Question: <i>Lactobacillus casei</i> Shirota compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7n).....	268
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> + <i>Lactobacillus plantarum</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> + <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium breve</i> + <i>B. longum</i> subsp. <i>infantis</i> + <i>Streptococcus salivarius</i> subsp. <i>thermophilus</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7o).....	269
Question: <i>Enterococcus faecalis</i> + <i>Clostridium butyricum</i> + <i>Bacillus mesentericus</i> + <i>Bacillus coagulans</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7p).....	271
Question: <i>Bifidobacterium longum</i> subsp. <i>longum</i> + <i>Bifidobacterium animalis</i> subsp. <i>lactis</i> + <i>Lactobacillus acidophilus</i> + <i>Lactobacillus rhamnosus</i> + <i>Lactobacillus plantarum</i> + <i>Pediococcus pentosaceus</i> compared to placebo for the treatment of acute infectious diarrhea in children (7q).....	273
Question: <i>Lactobacillus paracasei</i> subsp. <i>paracasei</i> ST11 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7t)	275

Question: <i>Lactobacillus acidophilus</i> + <i>Bifidobacterium bifidum</i> + <i>Lactobacillus delbrueckii</i> subsp. <i>bulgaricus</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7u).....	276
Question: <i>Bifidobacterium ruminatum</i> compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7v).....	278
Question: <i>Lactobacillus rhamnosus</i> 573L/1 and 573L/2 and 573L/3 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7w)	279
Question: <i>Lactobacillus acidophilus</i> + “Bifidobacter” compared to placebo for the treatment of acute infectious diarrhea in children (7x)	280
Appendix 8: Should probiotics be used in preterm, low birth weight infants?	281
Question: Single- and multiple-strain probiotics compared with no probiotics for preterm, low birth weight infants (8a)	281

Appendix 1: Should probiotics be used as part of the treatment of *Clostridioides difficile* infection?

Treatment-related Adverse Events in patients with recurrent disease only

1	randomised trials	not serious	not serious	serious ^d	serious ^c	none	No statistically significant differences in the number or type of adverse events in patients treated with <i>S. boulardii</i> or placebo, and that no adverse events occurred during the four-week follow-up period.			⊕⊕○○ LOW	CRITICAL
---	-------------------	-------------	-------------	----------------------	----------------------	------	--	--	--	-------------	----------

CI: Confidence interval; RR: Risk ratio

Explanations

a. Some indirectness identified based on difference in populations with regards to initial and/or recurrent infection (McFarland 1994) or just recurrent infection (Surawicz 2000). Additionally, indirectness identified based on comparators: placebo reported for McFarland 1994 and high dose vancomycin reported for Surawicz 2000.

b. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

c. No raw data reported. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

d. Some indirectness identified based on difference in populations with regards to initial and/or recurrent infection (McFarland 1994) or just recurrent infection (Surawicz 2000). Additionally, indirectness identified based on comparators: high dose vancomycin reported for Surawicz 2000.

Forest Plots

Comparison: 1 S.bouardii versus placebo

Outcome: 2 Recurrence of diarrhea

Comparison: 1 S.bouardii versus placebo

Outcome: 1 Cessation of diarrhea

Question: *Lactobacillus plantarum* 299v compared to placebo/antibiotics in symptomatic patients with confirmed *C. difficile* infection (1b)

Bacteriological Cure (Resolution of CDI) (follow up: range 11 days to 13 days; assessed with: Negative assay for *C. difficile* toxin)

1	randomised trials	not serious	not serious	serious ^a	very serious ^b	none	7/12 (58.3%)	7/9 (77.8%)	RR 0.75 (0.41 to 1.36)	194 fewer per 1,000 (from 459 fewer to 280 more)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	-------------	-------------	----------------------	---------------------------	------	--------------	-------------	-------------------------------	---	------------------	----------

Treatment-related Adverse Events

1	randomised trials	not serious	not serious	serious ^a	serious ^c	none	0/12 (0.0%)	0/9 (0.0%)	not estimable		⊕⊕○○ LOW	CRITICAL
---	-------------------	-------------	-------------	----------------------	----------------------	------	-------------	------------	---------------	--	-------------	----------

CI: Confidence interval; RR: Risk ratio

Explanations

- a. Study only reports on adults; therefore, these findings may not be generalizable to children.
- b. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.
- c. No events reported out of small sample.

Forest Plots

Comparison: 2 L. plantarum versus placebo

Outcome: 1 Cessation of diarrhea

Comparison: 2 L. plantarum versus placebo

Outcome: 2 Recurrence of diarrhea

Comparison: 2 L. plantarum versus placebo

Outcome: 3 Bacteriological cure

Question: *Lactobacillus rhamnosus* ATCC 53103 compared to placebo/antibiotics in symptomatic patients with confirmed *C. difficile* infection (1c)

Bibliography: Lawrence 2005

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. rhamnosus</i> ATCC 53103	Placebo/Antibiotics	Relative (95% CI)	Absolute (95% CI)		

Recurrent *C. difficile*-associated Diarrhea

1	randomised trials	not serious ^a	not serious	serious ^b	very serious ^c	none	3/8 (37.5%)	1/7 (14.3%)	RR 2.63 (0.35 to 19.85)	233 more per 1,000 (from 93 fewer to 1,000 more)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	--------------------------	-------------	----------------------	---------------------------	------	-------------	-------------	-----------------------------------	--	------------------	----------

Treatment-related Adverse Events

1	randomised trials	not serious ^a	not serious	serious ^b	serious ^d	none	Mild gastrointestinal upset with bloating (25%) and flatulence (37.5%) reported in patients treated with <i>L. rhamnosus</i> ATCC 53103.		⊕⊕○○ LOW	CRITICAL
---	-------------------	--------------------------	-------------	----------------------	----------------------	------	--	--	-------------	----------

CI: Confidence interval; RR: Risk ratio

Explanations

a. Type of antibiotic and duration of antibiotic dosing is unclear.

b. Reported study population includes adults only. May not be generalizable to the entire population.

c. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

d. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Forest Plots

Comparison: 3 Lactobacillus rhamnosus GG versus placebo

---	-------------------	--------------------------	-------------	----------------------	-------------	--	---------------	-----------------	----------------------------------	---	-------------	-----------

CI: Confidence interval; RR: Risk ratio

Explanations

a. 21/31 of the studies included had high or uncertain risk of bias.

b. rating down once for risk of bias covered multiple minor concerns, including publication bias.

- c. overall effect estimate was heavily influenced by 5 studies with a baseline risk of CDAD > 15%, studies with a low baseline risk of CDAD did not demonstrate significant risk reduction
- d. The 95% CI includes the potential for both benefit and harm.
- e. heterogeneity suggested based on an I² of 49%. Goldenberg 2017 authors suggest that this heterogeneity may be explained by a subgroup effect found between the probiotic species.
- f. heterogeneity suggested based on an I² of 61%. Goldenberg 2017 authors suggest that this heterogeneity may be explained by a subgroup effect from the inclusion of both pediatric vs adult populations.
- g. 12/23 studies with unclear or high risk of bias.
- h. statistically significant heterogeneity noted between studies (I² = 59%), may be explained by risk of bias.
- i. adults only included and may not be generalizable to the entire population.
- j. visual inspection of the funnel plot and statistical assessment via Harbord linear regression test were suggestive of small study effects (e.g. publication bias) (P = 0.02).
- k. 2/6 studies with unclear or high risk of bias reported.
- l. children only included and may not be generalizable to the entire population.
- m. with n=6 Harbord's linear regression test is underpowered to detect a significant interaction, however visual inspection of the funnel plot is suspicious for publication bias. Also, due to the review's inclusion criteria specific to CDAD not AAD we worry about the possibility of publication bias here.

Adverse events

1	randomised trials	serious ^{a,b,f}	not serious	serious ^{c,d}	serious ^e	none	One study (Schultz 2004) reported mild bloating which occurred in both probiotic and placebo groups. No other adverse events were reported (Schultz 2004). Patients were not withdrawn from the trial which used <i>L. rhamnosus</i> ATCC 53103 (2 x 10 ⁹ CFU per day) for 6 months. Prantera 2002a reported there were no adverse events relating solely to the use of the probiotic (<i>L. rhamnosus</i> ATCC 53103). Diarrhoea and bloating occurred in a similar proportion of patients receiving probiotic or placebo.			⊕○○○ VERY LOW	CRITICAL
---	-------------------	--------------------------	-------------	------------------------	----------------------	------	---	--	--	------------------	----------

CI: Confidence interval; **OR:** Odds ratio; **RR:** Risk ratio

Explanations

- Allocation concealment and/or blinding of outcome assessor unclear in Schultz 2004.
- Use of corticosteroids in both arms of Schultz 2004 could be a confounder.
- Age of patients and setting was not reported; therefore, it is difficult to speak to the generalizability of the results.

d. Schultz 2004 used antibiotics for 2 weeks prior to intervention, which is not consistent with clinical practice.

e. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

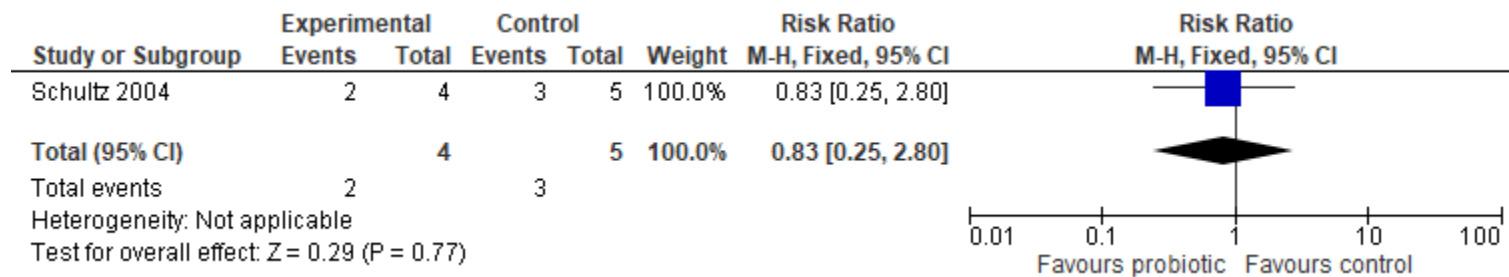

f. Prantera 2002a had uncertain allocation concealment and loss of 8 subjects in follow up, which is impactful given the few events reported do not meet the optimal information size and suggest fragility in the estimate.

---	-------------------	----------------------	-------------	-------------	----------------------	------	-------------	-------------	---------------	--	-------------	----------

CI: Confidence interval; RR: Risk ratio

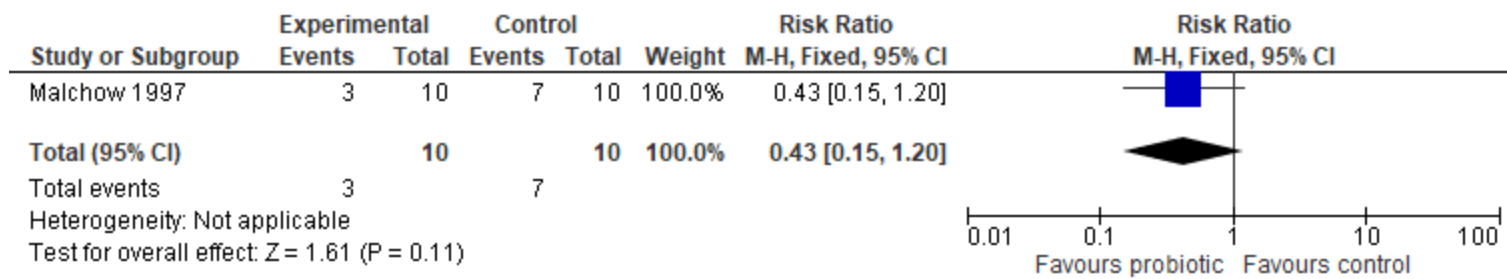

Explanations

a. Allocation generation and concealment unclear for Malchow 1997, missing data of 6 in intervention group and 2 in comparator group. In addition, all patients had active disease at enrollment and received prednisone which could impact lack of difference between the two groups.

b. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Forest Plots

Relapsed at end of treatment (defined as CDAI>150, PCDAI >10, or endoscopically)

CI: Confidence interval; RR: Risk ratio

Explanations

- a. Some studies report not blinded or blinding not clear, 1 study with high risk attrition bias, Tursi 2004 unclear allocation concealment.
- b. Serious heterogeneity observed ($I^2 = 86\%$).
- c. Interventions vary across studies: Tursi 2004 compares probiotics + balsalazide vs balsalazide; Miele 2009 both groups receive mesalamine maintenance therapy.
- d. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.
- e. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Clinical Remission:

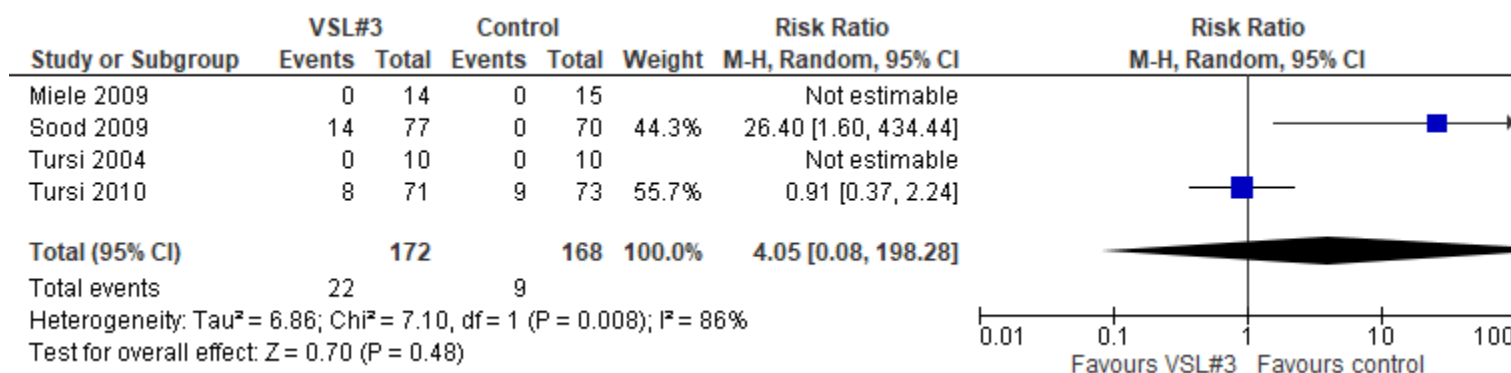

Study or Subgroup	VSL#3		Control		Weight	Risk Ratio	
	Events	Total	Events	Total		M-H, Random, 95% CI	M-H, Random, 95% CI
Miele 2009	13	14	4	15	20.1%	3.48	[1.49, 8.16]
Sood 2009	33	77	11	70	24.2%	2.73	[1.50, 4.97]
Tursi 2004	21	30	24	30	28.6%	0.88	[0.65, 1.17]
Tursi 2010	31	65	23	66	27.1%	1.37	[0.90, 2.08]
Total (95% CI)		186		181	100.0%	1.72	[0.89, 3.32]
Total events	98		62				
Heterogeneity: $\tau^2 = 0.37$; $\chi^2 = 21.92$, $df = 3$ ($P < 0.0001$); $I^2 = 86\%$							
Test for overall effect: $Z = 1.61$ ($P = 0.11$)							

Clinical Response:

---	-------------------	----------------------	-------------	-------------	----------------------	------	-------------	-------------	---------------	--	-------------	----------

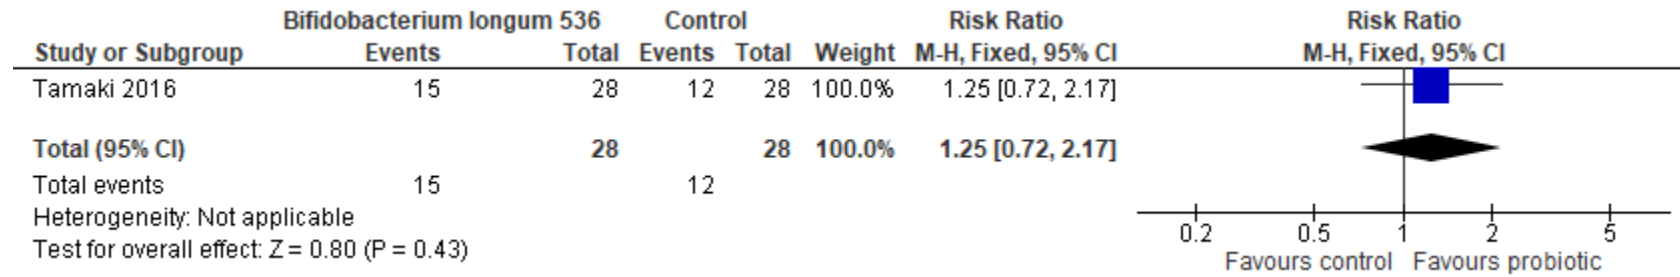

CI: Confidence interval; RR: Risk ratio

Explanations

- Tamaki 2016 has unclear allocation concealment, blinding of outcome assessor, and selective reporting of outcomes.
- The 95% CI includes the potential for both benefit and harm.
- No events reported out of a small sample.

Adverse events

4	randomized trials	serious ^{b,c,d}	not serious	serious ^d	very serious ^d	none	90/296 (30.4%)	86/300 (28.7%)	RR 1.09 (0.86 to 1.38)	26 more per 1,000 (from 40 fewer to 109 more)	⊕○○○○ VERY LOW	CRITICAL
---	-------------------	--------------------------	-------------	----------------------	---------------------------	------	----------------	----------------	----------------------------------	---	-------------------	----------

Remission at End of Study Period

2	randomized trials	serious ^{b,d}	serious ^e	not serious	very serious ^f	none	49/82 (59.8%)	64/84 (76.2%)	RR 0.86 (0.49 to 1.49)	107 fewer per 1,000 (from 389 fewer to 373 more)	⊕○○○○ VERY LOW	CRITICAL
---	-------------------	------------------------	----------------------	-------------	---------------------------	------	---------------	---------------	----------------------------------	--	-------------------	----------

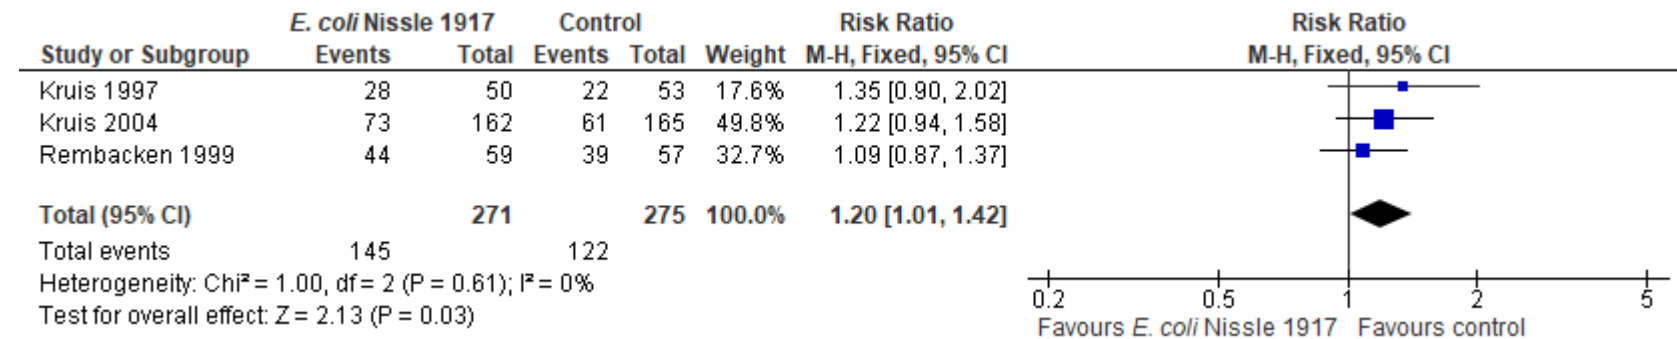

CI: Confidence interval; RR: Risk ratio

Explanations

- a. Kruis 1997 defines relapse as CAI > 4; Kruis 2004 defines relapse as CAI > 6 or Endoscopic index > 4.
- b. Rembacken 1999 did not report on technique of randomization, allocation concealment unclear, and personnel blinded during the study not described. Additionally, overall withdrawal rates were 8.9% for Rembacken 1999. After study entry, patients received gentamicin 80 mg TID, which is not standard of care.
- c. Allocation concealment unclear for all studies, sequence generation unclear for Kruis 1997. Kruis 2004 reported high dropout rate (46.5%).
- d. In Petersen 2014, all patients received prednisone, which may confound the effects of patients receiving *E. coli* Nissle.
- e. Heterogeneity among studies (I^2 79%)
- f. The 95% CI includes the potential for both benefit and harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Question: *Saccharomyces boulardii* compared to placebo for adults with IBS (6a)

Bibliography: Abbas 2014, Choi 2011, Kabir 2011

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>S. boulardii</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Abdominal pain subscale (follow up: range 4 weeks to 6 weeks)

3	randomised trials	serious ^a	not serious	not serious	very serious ^{b,c,d}	none	117	115	-	SMD 0.26 SD higher (0.09 lower to 0.61 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	-------------------------------	------	-----	-----	---	--	------------------	----------

IBS symptom scale (follow up: 4 weeks; Scale from: 0 to 6)

1	randomised trials	serious ^a	not serious	not serious	very serious ^{b,c}	none	45	45	-	MD 0.1 lower (0.43 lower to 0.23 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	-----------------------------	------	----	----	---	--	------------------	----------

CI: Confidence interval; SMD: Standardized mean difference; MD: Mean difference

Explanations

- Unclear risk of reporting bias in all studies
- The 95% CI includes the potential for both benefit and harm.
- Few events reported do not meet the optimal information size and suggest fragility in the estimate.
- May not provide a clinically meaningful estimate based on the interpretation of the SMD.

Abdominal pain subscale (assessed at end of study)

IBS symptom scale (7-point scale)

Question: *Lactobacillus paracasei* subsp. *paracasei* + *Lactobacillus plantarum* + *Lactobacillus acidophilus* + *Lactobacillus delbrueckii* subsp. *bulgaricus* + *Bifidobacterium longum* subsp. *longum* + *Bifidobacterium breve* + *B. longum* subsp. *infantis* + *Streptococcus salivarius* subsp. *thermophilus* compared to placebo for adults with IBS (6b)

Question: *Lactobacillus reuteri* compared to placebo for adults with IBS (6i)

Bibliography: Amirmani 2013

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. reuteri</i>	Placebo	Relative (95% CI)	Absolute (95% CI)		

Abdominal Pain

1	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	41	31	-	mean 0.46 higher (0.23 lower to 1.15 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	----	----	---	---	------------------	----------

Mean Stool Frequency

1	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	41	31	-	mean 0.29 lower (0.87 lower to 0.29 higher)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	----	----	---	--	------------------	----------

CI: Confidence interval

Explanations

a. High risk of selection, detection, performance, and attrition bias. Symptom scores appear unbalanced at baseline, therefore measurement at end of study also unbalanced (i.e., mean stool frequency reflects an increase from baseline for probiotic group and a decrease from baseline in placebo group).

b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Abdominal pain Scores at end of treatment

Mean Stool Frequency at end of treatment

Question: *Lactobacillus reuteri* DSM 17938 compared to placebo for children with IBS (6j)

CI: Confidence interval

Explanations

a. High risk of attrition bias

b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Question: *Lactobacillus gasseri* BNR17 compared to placebo for treatment of IBS (6k)

Bibliography: Shin 2018, Kim 2018

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. gasseri</i> BNR17	Placebo	Relative (95% CI)	Absolute (95% CI)		

Change in Abdominal Pain Scores from Baseline

2	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	Shin 2018 reports abdominal pain score reduction in probiotic arm of 2.4 (from 3.6 to 1.2; n=24) compared with placebo arm of 1.8 (from 4.7 to 2.9; n=27) at week 8. Kim 2018 suggests benefit in intervention arm (n=55)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	---	------------------	----------

Change in Disturbed Daily Life Scores

1	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	Shin 2018 reports abdominal pain score reduction in probiotic arm of 2 (from 6.8 to 4.8; n=24) compared with placebo arm of 2 (from 5.5 to 3.5; n=27) at week 8.	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	--	------------------	----------

CI: Confidence interval

Explanations

a. High risk of selection and attrition bias

b. Few events reported do not meet the optimal information size and suggest fragility in the estimate; the narrative suggests there may not be a meaningful difference between groups.

Question: *Saccharomyces cerevisiae* CNCM I-3856 compared to placebo for treatment of IBS in adults (6I)

Bibliography: Pineton 2015, Spiller 2016

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>S. cerevisiae</i> CNCM I-3856	Placebo	Relative (95% CI)	Absolute (95% CI)		

Change in Abdominal Pain from Baseline (IBS all subtypes)

1	randomised trials	serious ^a	not serious	not serious	serious ^c	none	86	93	-	mean 0.35 lower (0.75 lower to 0.05 higher)	⊕⊕○○ LOW	CRITICAL

No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. acidophilus</i> NCIMB 30157 and NCIMB 30156 + <i>B. bifidum</i> NCIMB 30153 + <i>B. animalis</i> subsp. <i>lactis</i> NCIMB 30172	Placebo	Relative (95% CI)	Absolute (95% CI)		

IBS SSS at 8 weeks

1	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	28	24	-	mean 21.77 lower (76.64 lower to 33.1 higher)	⊕○○○ ○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	----	----	---	---	-----------------------	----------

CI: Confidence interval

Explanations

a. High risk of selection and attrition bias

b. Few events reported do not meet the optimal information size and suggest fragility in the estimate. The 95% CI includes the potential for both benefit and harm.

IBS SSS at 8 weeks (lower = better; measured at 8 weeks)

Question: *Lactobacillus acidophilus* KCTC 11906BP + *Lactobacillus plantarum* KCTC 11867BP + *Lactobacillus rhamnosus* KCTC 11868BP + *Bifidobacterium breve* KCTC 11858BP + *Bifidobacterium animalis* subsp. *lactis* KCTC 11903BP + *Bifidobacterium longum* subsp. *longum* KCTC 11860BP + *Streptococcus salivarius* subsp. *thermophilus* KCTC 11870BP compared to placebo for adults with IBS (6x)

Bibliography: Ki Cha 2012

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Placebo	Relative (95% CI)	Absolute (95% CI)			
						<i>L. acidophilus</i> KCTC 11906BP + <i>L. plantarum</i> KCTC 11867BP + <i>L. rhamnosus</i> KCTC 11868BP + <i>B. breve</i> KCTC 11858BP + <i>B. animalis</i> subsp. <i>lactis</i> KCTC 11903BP + <i>B. longum</i> subsp. <i>longum</i> KCTC 11860BP + <i>S. salivarius</i> subsp. <i>thermophilus</i> KCTC 11870BP						

Adequate Relief of IBS Symptoms

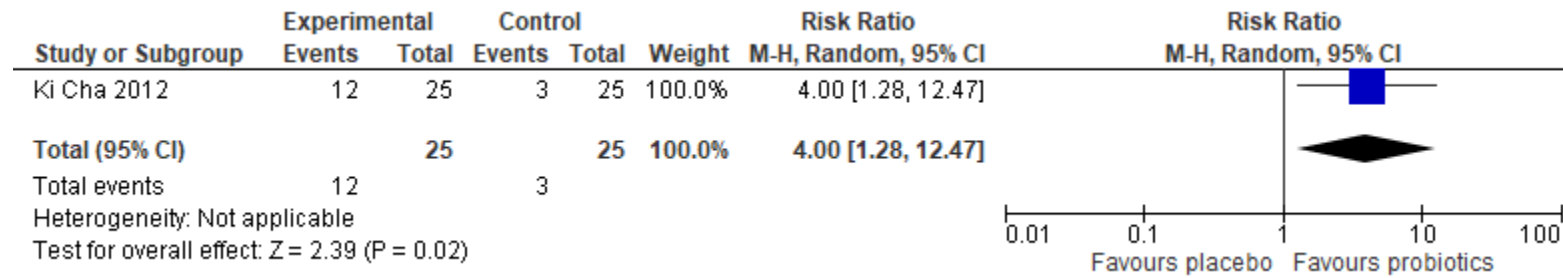

Certainty assessment							No of patients	Effect		Certainty	Importance	
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	Placebo	Relative (95% CI)	Absolute (95% CI)			
1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	12/25 (48.0%)	3/25 (12.0%)	RR 4.00 (1.28 to 12.47)	360 more per 1,000 (from 34 more to 1,000 more)	⊕⊕○○ LOW	CRITICAL

CI: Confidence interval; RR: Risk ratio

Explanations

- a. Unclear risk of detection and reporting bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Adequate Relief of IBS Symptoms

Question: *Bifidobacterium bifidum* MIMBb75 compared to placebo for adults with IBS (6y)

Bibliography: Guglielmetti 2011

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. bifidum</i> MIMBb75	Placebo	Relative (95% CI)	Absolute (95% CI)		

Response Rate as per SGA

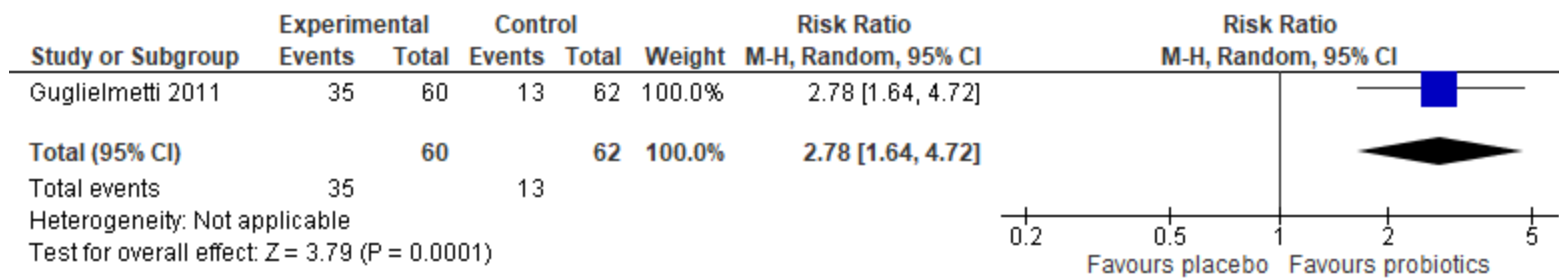

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	35/60 (58.3%)	13/62 (21.0%)	RR 2.78 (1.64 to 4.72)	373 more per 1,000 (from 134 more to 780 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	------------------	------------------	----------------------------------	--	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. Unclear risk of detection and reporting bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Overall Response Rate as per SGA

Question: *Bifidobacterium animalis* subsp. *animalis* DN-173 + *Streptococcus salivarius* subsp. *thermophilus* + *Lactobacillus delbrueckii* subsp. *bulgaricus* compared to placebo for adults with IBS (6z)

							<i>L. paracasei</i> subsp. <i>paracasei</i> F-19 + <i>L. acidophilus</i> LA-5 + <i>B. animalis</i> subsp. <i>lactis</i> Bb12 + <i>L. delbrueckii</i> subsp. <i>bulgaricus</i> + <i>S. salivarius</i> subsp. <i>thermophilus</i>					

Adequate Relief of Symptoms

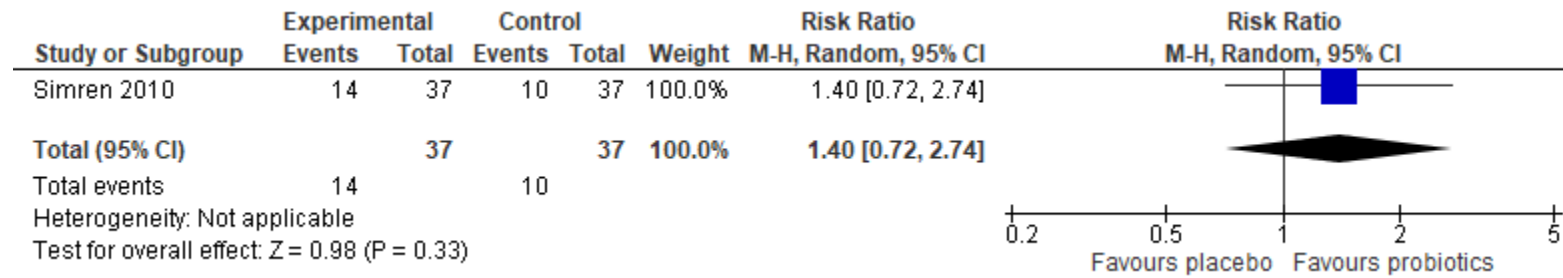

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	14/37 (37.8%)	10/37 (27.0%)	RR 1.40 (0.72 to 2.74)	108 more per 1,000 (from 76 fewer to 470 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	---------------	---------------	----------------------------------	--	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. Unclear risk of reporting and detection bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Adequate Relief of Symptoms

Question: *Lactobacillus plantarum* CECT7484 and CECT7485 + *Pediococcus acidilactici* CECT7483 compared to placebo for adults with IBS (6ab)

Bibliography: Lorenzo-Zuniga 2014

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. plantarum</i> CECT7484 and CECT7485 + <i>P. acidilactici</i> CECT7483	Placebo	Relative (95% CI)	Absolute (95% CI)		

Proportion with Good Response

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	26/47 (55.3%)	4/24 (16.7%)	RR 6.19 (1.83 to 20.92)	865 more per 1,000 (from 138 more to 1,000 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	---------------	--------------	-----------------------------------	--	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. Unclear risk of detection and reporting bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Proportion with Good Response (i.e. change in IBS-QoL ≥ 15)

Question: *Bifidobacterium longum* subsp. *infantis* M-63 + *Bifidobacterium breve* M-16V + *B. longum* Reuter ATCC BAA-999 compared to placebo for children with IBS (6ac)

Bibliography: Giannetti 2017

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. longum</i> subsp. <i>infantis</i> M-63 + <i>B. breve</i> M-16V + <i>B. longum</i> Reuter ATCC BAA-999	Placebo	Relative (95% CI)	Absolute (95% CI)		

Proportion with Resolution of Abdominal Pain

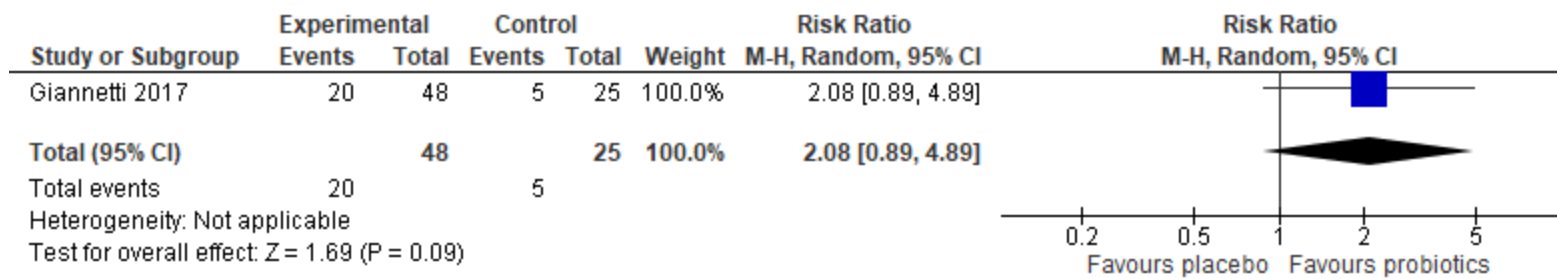

1	randomised trials	not serious	not serious	not serious	very serious ^a	none	20/48 (41.7%)	5/25 (20.0%)	RR 2.08 (0.89 to 4.89)	216 more per 1,000 (from 22 fewer to 778 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	-------------	-------------	-------------	---------------------------	------	---------------	--------------	-------------------------------	---	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

a. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Proportion with Resolution of Abdominal Pain

Question: *Lactobacillus brevis* KB290 compared to placebo for adults and children with IBS (6ad)

Bibliography: Murakami 2012

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. brevis</i> KB290	Placebo	Relative (95% CI)	Absolute (95% CI)		
Overall Health QOL (lower score is better)												
1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	23	23	-	mean 0.1 lower (0.56 lower to 0.36 higher)	⊕⊕○○ LOW	CRITICAL

CI: Confidence interval

Explanations

- a. Unclear risk of bias in all domains
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Overall Health QOL (lower = better)

Question: *Lactobacillus casei* DG compared to placebo for adults with IBS (6ae)

Bibliography: Cremon 2018

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. casei</i> DG	Placebo	Relative (95% CI)	Absolute (95% CI)		

Proportion of Responders for Abdominal Pain

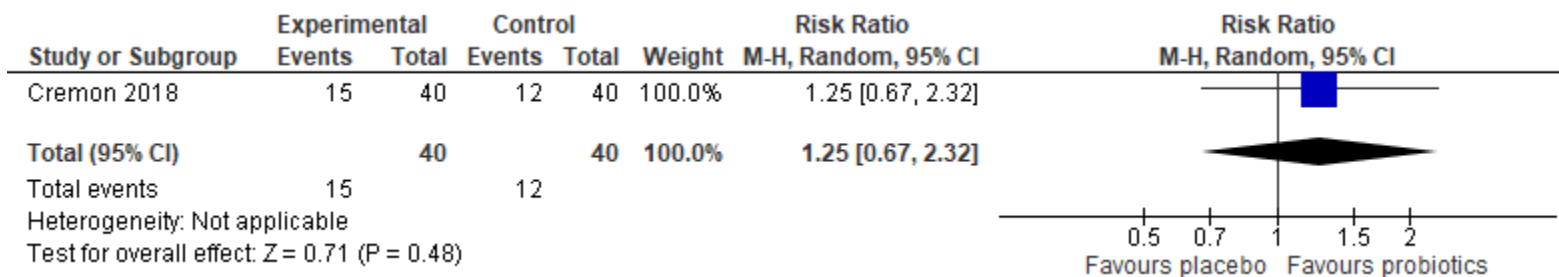

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	15/40 (37.5%)	12/40 (30.0%)	RR 1.25 (0.67 to 2.32)	75 more per 1,000 (from 99 fewer to 396 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	---------------	---------------	----------------------------------	---	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. Unclear risk of detection bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Proportion of Response of Abdominal Pain

Question: *Lactobacillus acidophilus* NCFM + *Bifidobacterium animalis* subsp. *lactis* ATCC SD5220 compared to placebo for adults with IBS (6af)

Bibliography: Ringel 2011

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. acidophilus</i> NCFM + <i>B. animalis</i> subsp. <i>lactis</i> ATCC SD5220	Placebo	Relative (95% CI)	Absolute (95% CI)		

Bloating Severity Scores in IBS Subgroup

1	randomised trials	not serious	not serious	not serious	very serious ^a	none	17	16	-	mean 2.49 lower (4.54 lower to 0.44 lower)	⊕⊕○○ LOW	CRITICAL
---	-------------------	-------------	-------------	-------------	---------------------------	------	----	----	---	---	-------------	----------

CI: Confidence interval

Explanations

a. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Bloating Severity Scores in IBS Subgroup (lower = better)

Question: *Lactobacillus acidophilus* CL1285 + *Lactobacillus casei* LBC80R + *Lactobacillus rhamnosus* CLR2 compared to placebo for adults with IBS (6ag)

Bibliography: Preston 2018

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. acidophilus</i> CL1285 + <i>L. casei</i> LBC80R + <i>L. rhamnosus</i> CLR2	Placebo	Relative (95% CI)	Absolute (95% CI)		

Improvement in QOL Score

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	58	27	-	mean 5.57 higher (4.89 lower to 16.03 higher)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	----	----	---	--	-------------	----------

CI: Confidence interval

Explanations

a. unclear risk of selection bias

b. Few events reported do not meet the optimal information size and suggest fragility in the estimate. The 95% CI includes the potential for both benefit and harm.

Improvement in QOL Score

Question: *Bacillus subtilis* PXN 21 + *Bifidobacterium bifidum* PXN 23 + *Bifidobacterium breve* PXN 25 + *Bifidobacterium longum* subsp. *infantis* PXN 27 + *B. longum* subsp. *longum* PXN 30 + *Lactobacillus acidophilus* PXN 35 + *Lactobacillus delbrueckii* subsp. *bulgaricus* PXN39 + *Lactobacillus casei* PXN 37 + *Lactobacillus plantarum* PXN 47 + *Lactobacillus rhamnosus* PXN 54 + *Lactobacillus helveticus* PXN 45 + *Lactobacillus salivarius* PXN 57 + *Lactococcus lactis* PXN63 + *Streptococcus salivarius* subsp. *thermophilus* PXN 66 compared to placebo for adults with IBS (6ah)

Overall IBS-SSS Score at 5 months

1	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	181	179	-	mean 66 lower (84 lower to 48 lower)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	-----	-----	---	--	------------------	----------

CI: Confidence interval

Explanations

- a. high risk of attrition and reporting bias
- b. The 95% CI includes the potential for both benefit and harm.

Overall IBS-SSS Score at 5 months

Question: *Bifidobacterium bifidum* BGN4 + *Bifidobacterium animalis* subsp. *lactis* AD011 + *Lactobacillus acidophilus* AD031 + *Lactobacillus casei* IBS041 compared to placebo for adults with IBS (6ai)

Bibliography: Hong 2009

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. bifidum</i> BGN4 + <i>B. animalis</i> subsp. <i>lactis</i> AD011 + <i>L. acidophilus</i> AD031 + <i>L. casei</i> IBS041	Placebo	Relative (95% CI)	Absolute (95% CI)		

Response Rate for Pain

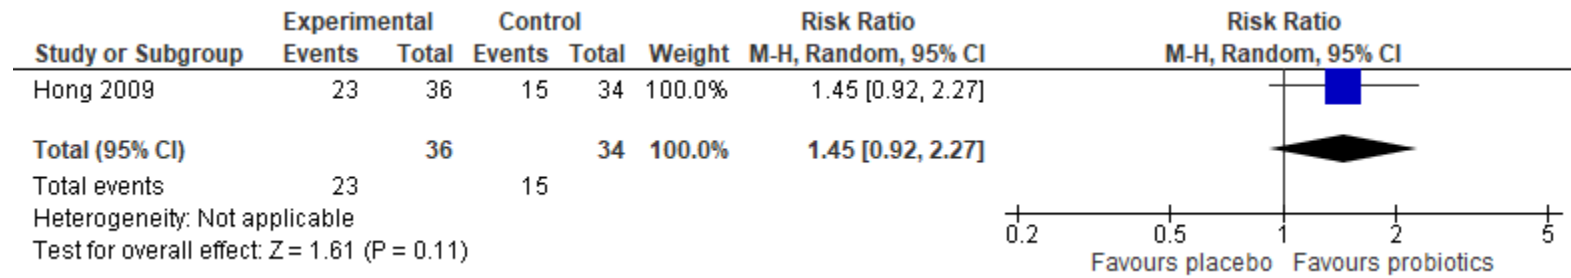

1	randomised trials	serious ^a	not serious	not serious	serious ^b	none	23/36 (63.9%)	15/34 (44.1%)	RR 1.45 (0.92 to 2.27)	199 more per 1,000 (from 35 fewer to 560 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	---------------	---------------	-------------------------------	---	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. unclear risk of reporting and detection bias
- b. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Pain Response Rate

Question: *Bifidobacterium longum* subsp. *longum* + *Lactobacillus acidophilus* compared to no probiotics for adults with IBS (6aj)

Bibliography: Cui 2012

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. longum</i> subsp. <i>longum</i> + <i>L. acidophilus</i>	No probiotics	Relative (95% CI)	Absolute (95% CI)		

Frequency of effective response to abdominal pain

1	randomised trials	serious ^a	not serious	not serious	very serious ^b	none	23/35 (65.7%)	6/20 (30.0%)	RR 2.19 (1.08 to 4.46)	357 more per 1,000 (from 24 more to 1,000 more)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	---------------------------	------	---------------	--------------	-------------------------------	--	------------------	----------

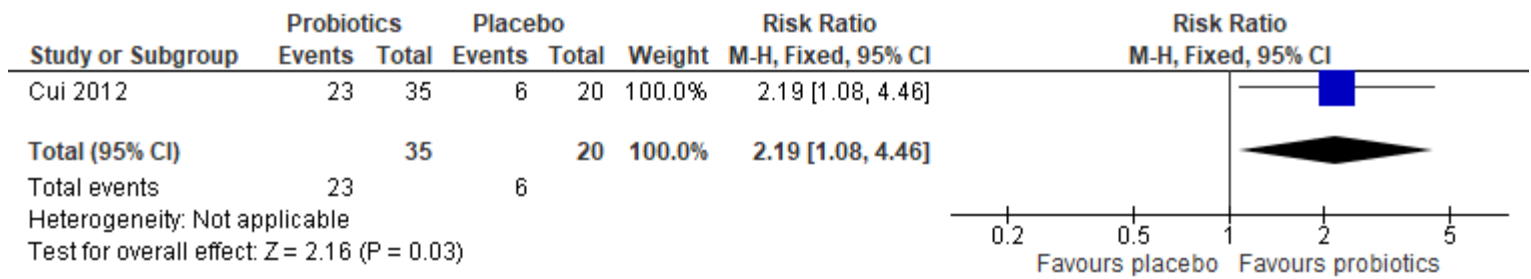

CI: Confidence interval; RR: Risk ratio

Explanations

a. Unclear reporting of methods.

b. The 95% CI may not include a clinically meaningful difference. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Frequency of abdominal pain (measured by response in effectiveness)

Question: *Clostridium butyricum* compared to no probiotics for adults with IBS (6ak)

Bibliography: Sun 2018

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	C. <i>butyricum</i>	No probiotics	Relative (95% CI)	Absolute (95% CI)		

IBS symptoms (assessed at 4 weeks)

1	randomised trials	serious ^a	not serious	not serious	very serious ^b	none	85	81	-	MD 23.20 lower (44.06 lower to 2.34 lower)	⊕○○○ VERY LOW	CRITICAL

Global relief of IBS symptoms

1	randomised trials	serious ^a	not serious	not serious	very serious ^b	none	17/25 (68.0%)	9/24 (37.5%)	RR 1.81 (1.01 to 3.25)	304 more per 1,000 (from 4 more to 844 more)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	---------------------------	------	---------------	--------------	----------------------------------	--	------------------	----------

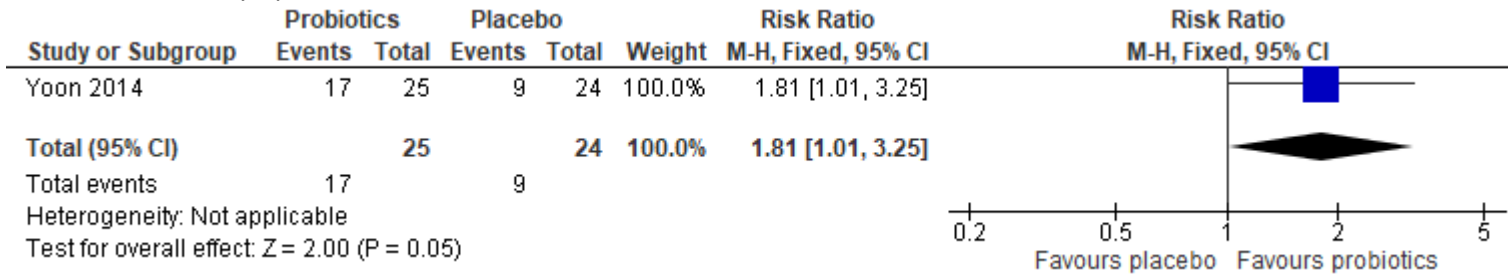

CI: Confidence interval; RR: Risk ratio

Explanations

a. Serious concerns due to unclear methods for blinding and reporting.

b. The 95% CI may not include clinically meaningful benefits. Small sample suggests fragility in the estimate.

Global relief of IBS symptoms

Question: *Bifidobacterium animalis* subsp. *lactis* W52 + *Lactobacillus casei* W56 + *Lactobacillus salivarius* W57 + *Lactococcus lactis* W58 + *Lactobacillus acidophilus* ATCC 700396 + *Lactobacillus rhamnosus* W71 compared to placebo for adults with IBS (6aq)

Bibliography: Ludidi 2014

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. animalis</i> subsp. <i>lactis</i> W52 + <i>L. casei</i> W56 + <i>L. salivarius</i> W57 + <i>L. lactis</i> W58 + <i>L. acidophilus</i> ATCC 700396 + <i>L. rhamnosus</i> W71	Placebo	Relative (95% CI)	Absolute (95% CI)		

Number of hypersensitive patients(6 weeks)

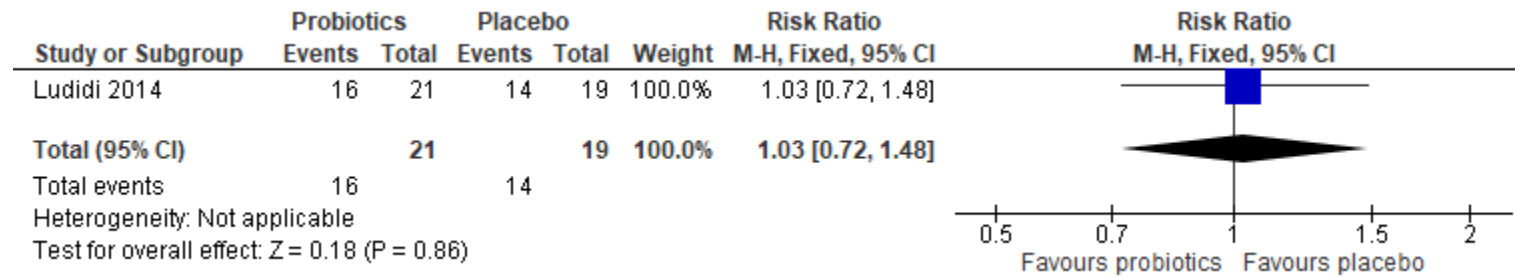

1	randomised trials	not serious	not serious	not serious	very serious ^a	none	16/21 (76.2%)	14/19 (73.7%)	RR 1.03 (0.72 to 1.48)	22 more per 1,000 (from 206 fewer to 354 more)	⊕⊕○○ LOW	
---	-------------------	-------------	-------------	-------------	---------------------------	------	---------------	---------------	----------------------------------	--	-------------	--

CI: Confidence interval; RR: Risk ratio

Explanations

a. The 95% CI includes the potential for both appreciable benefit as well as appreciable harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Number of hypersensitive patients (6 weeks)

Question: *Lactobacillus rhamnosus* ATCC 53103 and LC705 + *Bifidobacterium breve* Bb99 + *Propionibacterium freudenreichii* subsp. *shermanii* JS compared to placebo for adults with IBS (6ar)

Bibliography: Kajander 2005

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. rhamnosus</i> ATCC 53103 + <i>L. rhamnosus</i> LC705 + <i>B. breve</i> Bb99 + <i>P. freudenreichii</i> subsp. <i>shermanii</i> JS	Placebo	Relative (95% CI)	Absolute (95% CI)		

Symptom score (abdominal pain, distension, flatulence, borborygmi) (assessed with: difference from baseline)

1	randomised trials	not serious	not serious	not serious	very serious ^a	none	52	51	-	SMD 7.7 SD lower (13.9 lower to 1.6 lower)	⊕⊕○○ LOW	CRITICAL
---	-------------------	-------------	-------------	-------------	---------------------------	------	----	----	---	--	-------------	----------

CI: Confidence interval; **SMD:** Standardized mean difference

Explanations

a. The 95% CI includes values that may not be clinically meaningful. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Question: *Lactobacillus rhamnosus* ATCC 53103 compared to no probiotics for children with IBS (6as)

Bibliography: Gawronska 2007

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. rhamnosus</i> ATCC 53103	No probiotics	Relative (95% CI)	Absolute (95% CI)		

Treatment success

----	-------------------	------------------------	----------------------	-------------	-------------	------	------	------	---	--	-------------	----------

CI: Confidence interval; RR: Risk ratio; MD: Mean difference

Explanations

- a. Several studies with unclear sequence generation, allocation concealment, or open with no blinding (some without placebo)
- b. Several studies with follow up < 90%
- c. Significant heterogeneity across studies due to difference in study design, probiotic strains used, single vs. combination of probiotics, age of participants, and setting

Mean Duration of Diarrhea:

Total (95% CI) 4662 4556 100.0% -21.91 [-27.64, -16.17]

Heterogeneity: Tau² = 428.65; Chi² = 1408.81, df = 57 (P < 0.00001); I² = 96%

Test for overall effect: Z = 7.49 (P < 0.00001)

Proportion with Diarrhea \geq 4 days:

Question: *Saccharomyces boulardii* compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7a)

Bibliography: Burki 2017, Cetina-Sauri 1994, Chapoy 1985, Das 2016, Dinleyici 2015, Erdogan 2012, Hernandez 1998, Htwe 2008, Kurugol 2005, Riaz 2012, Sharif 2016, Urganci 2001, Villarruel 2007, Grandy 2010

Diarrhea Lasting > 4 days

8	randomised trials	very serious ^a	serious ^b	not serious	serious ^c	none	95/501 (19.0%)	169/425 (39.8%)	RR 0.45 (0.32 to 0.64)	219 fewer per 1,000 (from 270 fewer to 143 fewer)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	----------------------	-------------	----------------------	------	----------------	-----------------	------------------------	---	------------------	----------

Duration of Diarrhea

10	randomised trials	very serious ^a	serious ^d	not serious	serious ^e	none	745	667647	-	mean 28.77lower (40.35 lower to 17.18 lower)	⊕○○○ VERY LOW	CRITICAL
----	-------------------	---------------------------	----------------------	-------------	----------------------	------	-----	--------	---	--	------------------	----------

CI: Confidence interval; RR: Risk ratio

Explanations

- a. Most studies have at least one source of high risk of bias including lack of blinding (open study), sequence generation, or allocation concealment
- b. Heterogeneity among studies ($I^2 = 57\%$) due to differences in study design, participant age, and setting

- c. CI crossing 1 in several studies including study with weight of 25%
- d. Heterogeneity among studies ($I^2 = 89\%$) due to differences in study design, participant age, and setting
- e. The 95% CI includes the potential for both benefit and harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Duration ≥ 4 days

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. rhamnosus</i> ATCC 53103	placebo	Relative (95% CI)	Absolute (95% CI)		

Diarrhea > 4 days

4	randomised trials	serious ^a	serious ^b	not serious	not serious	none	88/286 (30.8%)	153/286 (53.5%)	RR 0.38 (0.27 to 0.54)	332 fewer per 1,000 (from 391 fewer to 246 fewer)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	----------------------	-------------	-------------	------	----------------	-----------------	----------------------------------	---	-------------	----------

Mean Stool Frequency Day 2

6	randomised trials	serious ^a	serious ^b	not serious	not serious	none	675	660	-	mean 0.75 lower (1.13 lower to 0.37 lower)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	----------------------	-------------	-------------	------	-----	-----	---	---	-------------	----------

CI: Confidence interval; RR: Risk ratio

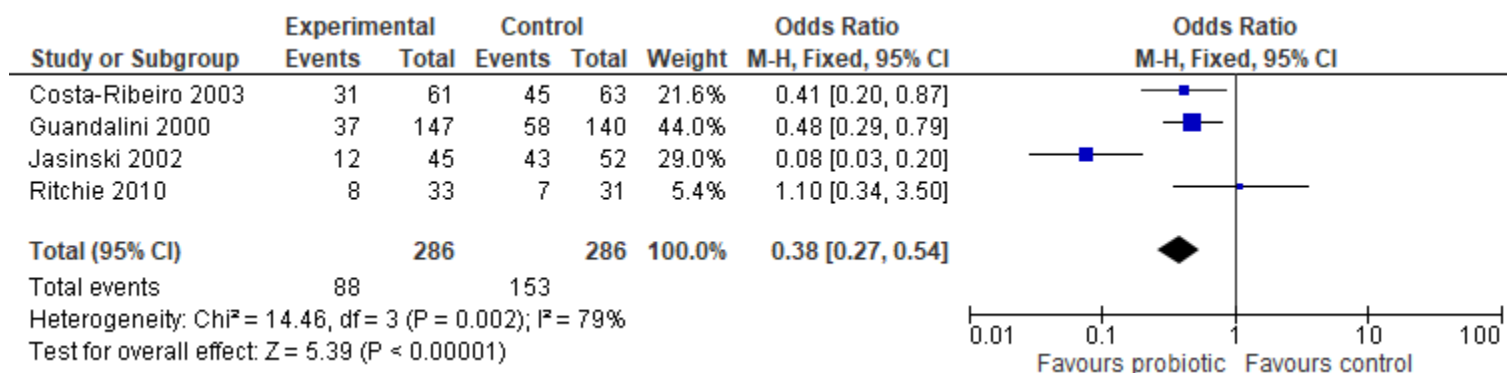

Explanations

- Several studies noted to have high risk of bias for either lack of blinding, low follow up rate, sequence generation, or allocation concealment
- Significant heterogeneity among studies due to differences in study design, participant age, and setting
- High risk of reporting bias with 1 study
- The 95% CI includes the potential for both benefit and harm.

Mean Duration of Diarrhea:

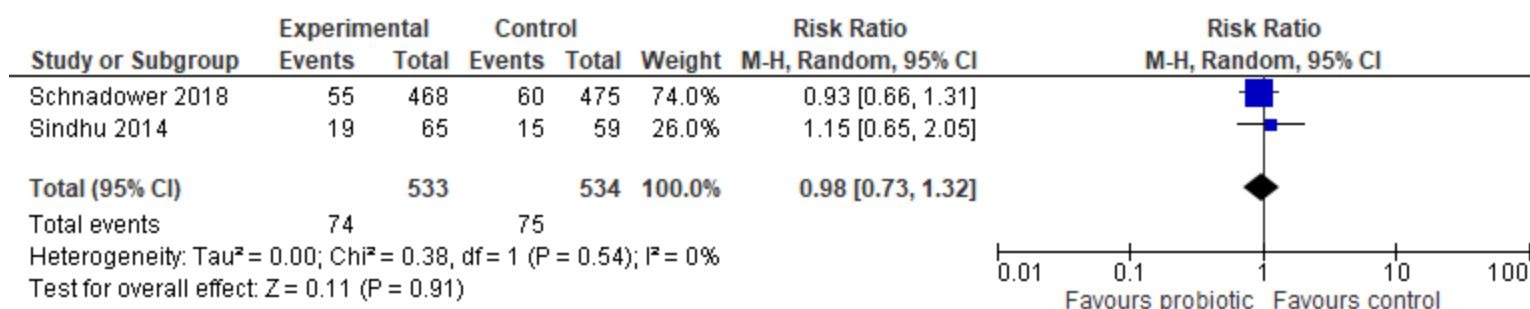

Diarrhea \geq 4 days

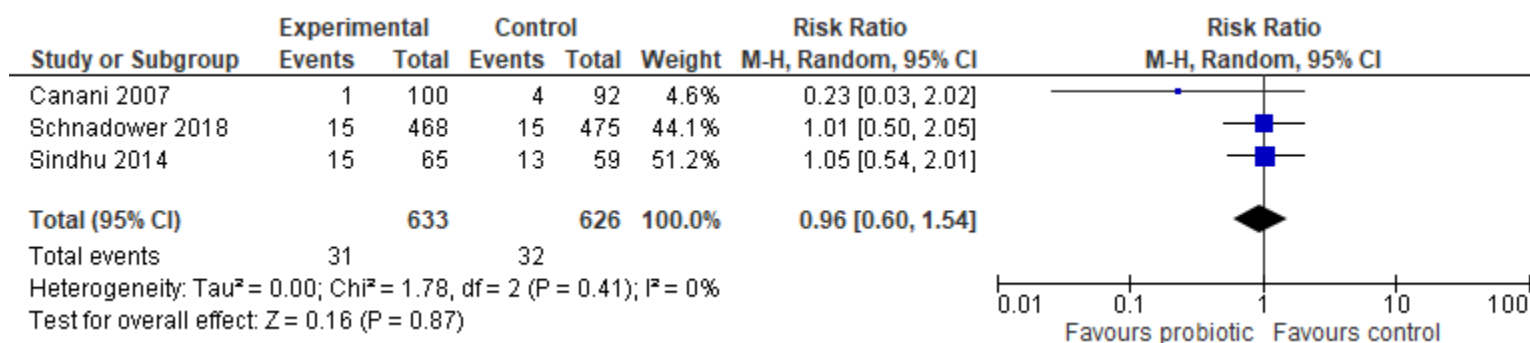

Mean Stool Frequency Day 2

Severe infection as per Vesikari scale:

Hospitalization:

Question: *Lactobacillus acidophilus* compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7c)

Bibliography: Bouilloche 1994, Khanna 2005, Lievein Le-Maol 2007, Simakachorn 2000, Chau 2018

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. acidophilus</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Mean Duration of Diarrhea

4	randomised trials	serious ^a	serious ^b	not serious	serious ^c	none	271	272	-	mean 7.79 lower (23.85 lower to 8.28 higher)	⊕○○○ VERY LOW	CRITICAL

Diarrhea Lasting >3days

4	randomised trials	serious ^d	not serious	not serious	serious ^e	none	22/159 (13.8%)	37/156 (23.7%)	RR 0.59 (0.33 to 1.05)	97 fewer per 1,000 (from 159 fewer to 12 more)	⊕⊕○○ LOW	CRITICAL
---	-------------------	----------------------	-------------	-------------	----------------------	------	----------------	----------------	-------------------------------	---	-------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

a. Unclear or high risk of selection bias

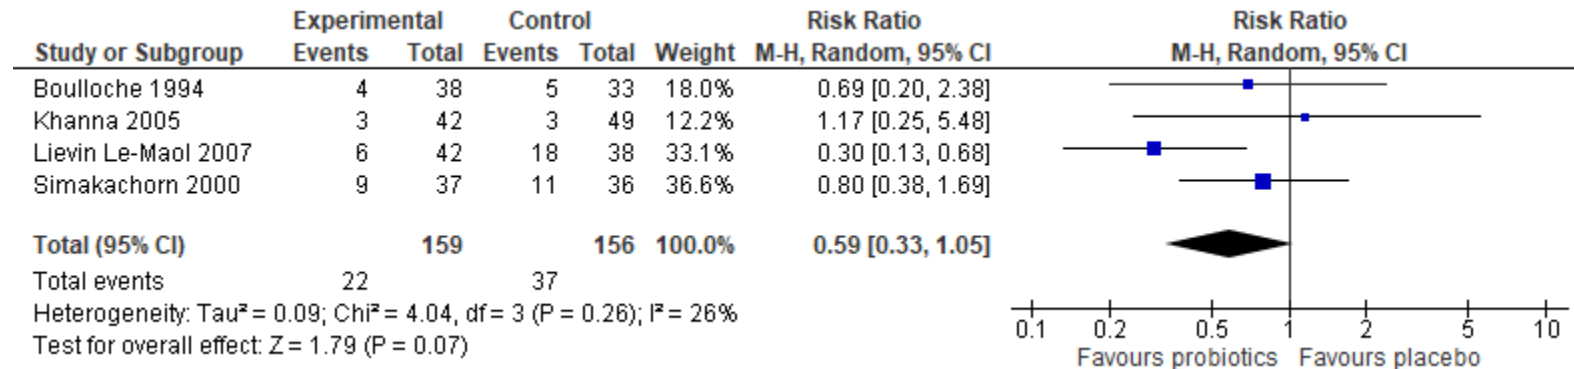

b. Studies have different direction of effect, I² 92%

- c. The 95% CI includes the potential for both benefit and harm.
- d. Unclear or high risk of selection bias and/or performance bias
- e. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Mean Duration of Diarrhea (Hours):

Diarrhea Lasting ≥ 3 days:

Question: *Lactobacillus acidophilus* + *Bifidobacterium bifidum* compared to placebo for the treatment of acute infectious diarrhea in children (7d)

Bibliography: Kianifar 2009, Lee 2001, Oandasan 1999, Phavichitr 2013, Rerksupphol 2010, Vivatvakin 2006

Certainty assessment							№ of patients		Effect		Certainty	Importance
№ of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. acidophilus</i> + <i>B. bifidum</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Mean duration of diarrhea (assessed with: hours)

6	randomised trials	serious ^b	serious ^a	not serious	not serious	none	241	237	-	MD 28.44 hours lower (45.72 lower to 11.15 lower)	⊕⊕○ LOW	CRITICAL
---	-------------------	----------------------	----------------------	-------------	-------------	------	-----	-----	---	---	------------	----------

CI: Confidence interval; **MD:** Mean difference

Explanations

- Some inconsistency suspected based on visual inspection of the forest plot and high I^2 of 89%.
- Risk of bias assessment identified unclear and high concerns among all included studies.

Mean Duration of Diarrhea:

Question: *Lactobacillus reuteri* compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7e)

Bibliography: Shornikova 1997b, Shornikova 1997c, Dinleyici 2015a, Dinleyici 2014, Francavilla 2012

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>L. reuteri</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Mean Duration of Diarrhea

4	randomised trials	serious ^a	not serious ^b	not serious	not serious	none	133	140	-	mean 24.36 lower (35.55 lower to 13.17 lower)	⊕⊕⊕○ MODERATE	CRITICAL

---	-------------------	----------------------	-------------	-------------	-------------	------	----------------	----------------	-------------------------------	---	---------------	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

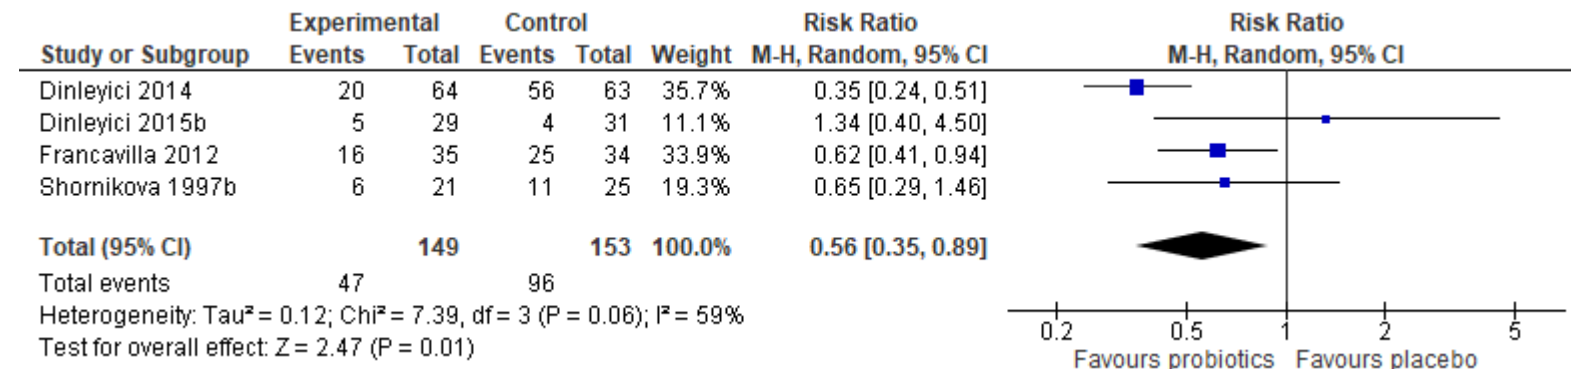

- a. Several studies with high risk of either performance bias, detection bias, or attrition bias
- b. Some heterogeneity among studies ($I^2 = 58\%$); however, all are in the same direction.

c. Some studies with high risk of performance bias, detection bias, or selection bias

Mean Duration of Diarrhea:

Diarrhea Lasting ≥ 3 days:

Question: *Lactobacillus helveticus* Rosell-52 + *Lactobacillus rhamnosus* Rosell-11 compared to placebo in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7f)

CI: Confidence interval; RR: Risk ratio

Explanations

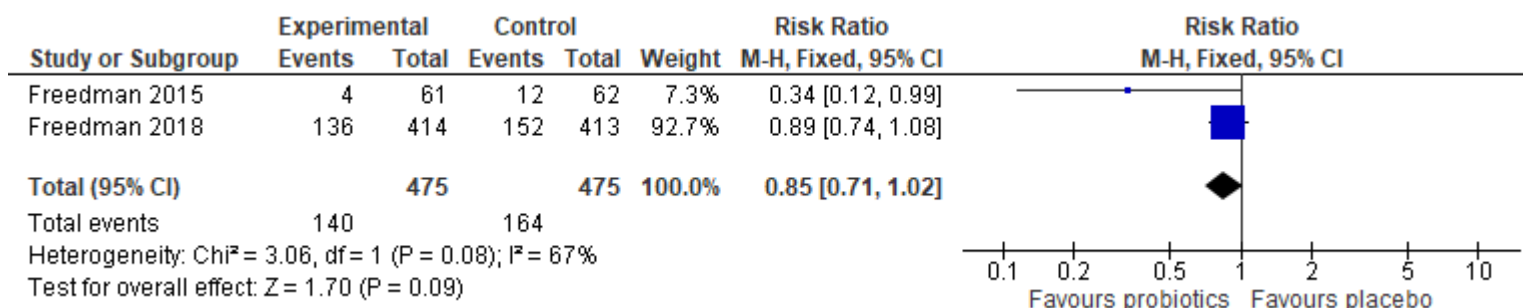

a. The 95% CI includes the potential for both benefit and harm. The 95% CI includes the potential for both benefit and harm.

b. Unclear risk of performance, detection, and reporting bias in Hegar 2015

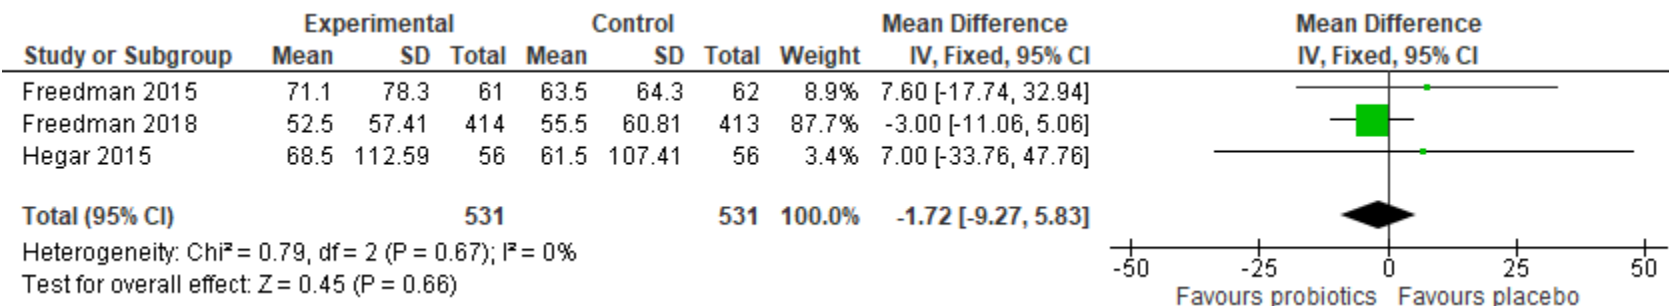

Hospitalization:

Adverse Events:

Mean Duration of Diarrhea:

Question: *Bifidobacterium animalis* subsp. *lactis* compared to placebo for treatment of acute infectious diarrhea in children (7g)

Bibliography: El-Soud 2015, Erdogan 2012, Mao 2008

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>B. animalis</i> subsp. <i>lactis</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Mean Duration of Diarrhea

3	randomised trials	very serious ^a	serious ^b	not serious	serious ^c	none	120	121	-	mean 1.88 lower (3.68 lower to 0.08 lower)	⊕○○○ VERY LOW	CRITICAL
---	-------------------	---------------------------	----------------------	-------------	----------------------	------	-----	-----	---	--	------------------	----------

CI: Confidence interval

Explanations

- a. Erdogan has high risk of performance bias and all studies have uncertain risk of selection, detection, and reporting bias
- b. Heterogeneity among studies (I2 94%)
- c. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Mean Duration of Diarrhea:

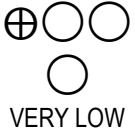

Question: *Streptococcus salivarius* subsp. *thermophilus* + *Lactobacillus delbrueckii* subsp. *bulgaricus* compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7h)

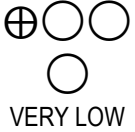

Bibliography: Bhatnagar 1998, Boudraa 2001

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>S. salivarius</i> subsp. <i>thermophilus</i> + <i>L. delbrueckii</i> subsp. <i>bulgaricus</i>	placebo	Relative (95% CI)	Absolute (95% CI)		

Diarrhea > 4 days

2	randomised trials	very serious ^a	not serious	not serious	serious ^b	none	23/103 (22.3%)	29/105 (27.6%)	RR 0.82 (0.51 to 1.30)	50 fewer per 1,000 (from 135 fewer to 83 more)	 VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	----------------	----------------	-------------------------------	---	---	----------

Mean Duration of Diarrhea

1	randomised trials	very serious ^a	not serious	not serious	serious ^c	none	56	61	-	mean 17.6 lower (30.16 lower to 5.04 lower)	 VERY LOW	CRITICAL
---	-------------------	---------------------------	-------------	-------------	----------------------	------	----	----	---	--	---	----------

CI: Confidence interval; **RR:** Risk ratio

Explanations

- a. High risk of detection and attrition bias in one study
- b. Low event rate
- c. The 95% CI includes the potential for both benefit and harm. Few events reported do not meet the optimal information size and suggest fragility in the estimate.

Diarrhea > 4days

Mean duration of diarrhea (hours)

Question: *Enterococcus faecium* SF68 compared to placebo and/or standard care in patients with signs and/or symptoms suggestive of acute infectious gastroenteritis (7i)

Bibliography: D'Apuzzo 1982

Certainty assessment							No of patients		Effect		Certainty	Importance
No of studies	Study design	Risk of bias	Inconsistency	Indirectness	Imprecision	Other considerations	<i>E. faecium</i> SF68	placebo	Relative (95% CI)	Absolute (95% CI)

Footnote: OR = odds ratio; MD = mean difference. Results are the mean difference, or odds ratio, and associated 95% confidence intervals (95% CIs) between the intervention and placebo from the network meta-analysis. Mean difference values < 0 indicates the

treatment is more effective than placebo. An OR > 1 indicates the treatment is superior to placebo; Underlined numbers in bold represent statistically significant results.

Table legends and description of color gradients:

	Statistically significant difference with placebo and at least one other tx	Statistically significant difference with placebo	Statistically no difference with placebo
High or moderate certainty evidence	Among the most effective	Inferior to the most effective, but superior to placebo	No more effective than placebo
Low or very low certainty evidence	May be among the most effective	May be inferior to the most effective, but superior to placebo	May be no more effective than placebo
