

Supplementary Figure S2. The β -diversity compared by principle coordinate analysis (PCoA) plots based on unweighted Unifrac of the conjunctival microbiota between the initial status and after 3 days of levofloxacin in the controls (A) or T2DM group (B), and between the initial status and 7 days after ceasing all postoperative medications of cataract surgery in control (C) or T2DM group (D). Adonis test was used to compare the differences.
