

**Supplementary Table 2.** HLA-DR expression in clones, obtained from freshly isolated unsorted NK cells and preliminary sorted HLA-DR-negative NK cell subset, on the 3<sup>rd</sup> week of their growth. HLA-DR surface expression MFI (normalized) was calculated as  $(\text{exp}/\text{control} - 1) * 100$ , where exp – mean of fluorescence intensity of experimental sample, control – mean of autofluorescence.

Clones from unsorted NK cells			Clones from HLA-DR-negative subset		
Clone #	HLA-DR-positive cells, %	HLA-DR-positive cells, MFI	Clone #	HLA-DR-positive cells, %	HLA-DR-positive cells, MFI
