Novel Technique for Retinal Nerve Cell Regeneration with Electrophysiological Functions Using Human Iris-Derived iPS Cells

Naoki Yamamoto ^{1,2,*}, Noriko Hiramatsu ³, Mahito Ohkuma ⁴, Natsuko Hatsusaka ¹, Shun Takeda ¹, Noriaki Nagai ⁵, Ei-ichi Miyachi ^{4,6}, Masashi Kondo ⁷, Kazuyoshi Imaizumi ⁷, Masayuki Horiguchi ⁸, Eri Kubo ¹ and Hiroshi Sasaki ¹

Supplementary Materials:

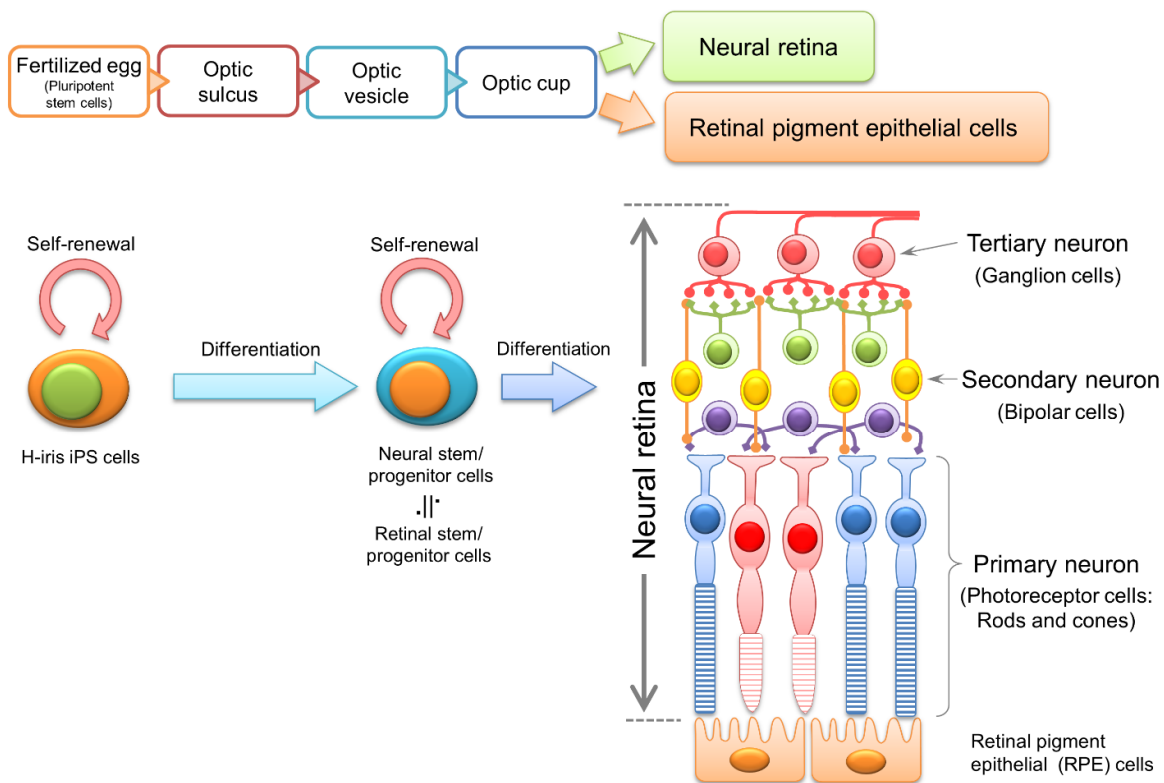

Figure S1. Outline of the differentiation of iPS cells into neural stem/progenitor cells, neural retina, and RPE.

Figure S2. Pigmented cells were observed at 30 days and were positive for RPE65 (a marker of retinal pigment epithelial cells) and ZO-1 (a marker of intercellular connections).
