

Supplementary Figures and Tables for Hekkala et al. 2021 Paleogenomics illuminates the evolutionary history of the extinct Holocene "horned" crocodile of Madagascar, *Voay robustus*

### Supplementary Figure 1.

Schematic representation of sample processing from sampling to sequencing for subfossil skull of *Voay robustus* (AMNH FR-3101). Negative controls are not depicted.

## Supplementary Figure 2.

Phylogenetic relationships of *Voay robustus* (red) based on partial mitochondrial (mt) genomes with estimated branch lengths in expected substitutions per site. Analyses of mt data robustly and consistently support a sister group relationship between *Voay* and a monophyletic *Crocodylus* (true crocodiles). The ML phylogram in this figure is based on the full mtDNA data set (partitioned by gene) with all four builds of the *Voay* mt genome (*Voay* AMNH FR-3101 *C. porosus* reference build, *Voay* AMNH FR-3101 *Osteolaemus* reference build, *Voay* AMNH FR-3103 *C. porosus* reference build and *Voay* AMNH FR-3103 *Osteolaemus* reference build). Note the very short terminal branches for the four mt genome builds for the *Voay* specimens. The tree is rooted with bird, turtle, and lizard outgroups (not shown). Paintings of crocodylians are by C. Buell; photo of *Voay* skull (AMNH FR-3101) is by E. Hekkala.

Supplementary Table 1: RAxML maximum likelihood analyses, PAUP\* parsimony analyses, and BEAST Bayesian tip-dating analyses used to test the stability of phylogenetic results. Trees with support scores can be found in Supplementary Data 2.
