

**Supplemental Figure 2.** There are no differences in response to photopic green light stimuli after developmental circadian disruption or diet treatment. Graph showing b-wave amplitude of photopic M-cone response to green light (530nm, flash stimulus = 0.1 log cd s/m<sup>2</sup> after 10-minute light adaptation at 1.5 log cd s/m<sup>2</sup>) at 21 weeks of age (1-way ANOVA,  $F(3, 47) = 1.47, p=0.24$ ), CL+CON n=14, CL+HFD n=12, CD+CON n=13, CD+HFD n=12.
