

# CONSORT-EHEALTH (V 1.6.1) - Submission/Publication Form

The CONSORT-EHEALTH checklist is intended for authors of randomized trials evaluating web-based and Internet-based applications/interventions, including mobile interventions, electronic games (incl multiplayer games), social media, certain telehealth applications, and other interactive and/or networked electronic applications. Some of the items (e.g. all subitems under item 5 - description of the intervention) may also be applicable for other study designs.

The goal of the CONSORT EHEALTH checklist and guideline is to be

- a) a guide for reporting for authors of RCTs,
- b) to form a basis for appraisal of an ehealth trial (in terms of validity)

CONSORT-EHEALTH items/subitems are MANDATORY reporting items for studies published in the Journal of Medical Internet Research and other journals / scientific societies endorsing the checklist.

Items numbered 1., 2., 3., 4a., 4b etc are original CONSORT or CONSORT-NPT (non-pharmacologic treatment) items.

Items with Roman numerals (i., ii, iii, iv etc.) are CONSORT-EHEALTH extensions/clarifications.

As the CONSORT-EHEALTH checklist is still considered in a formative stage, we would ask that you also RATE ON A SCALE OF 1-5 how important/useful you feel each item is FOR THE PURPOSE OF THE CHECKLIST and reporting guideline (optional).

Mandatory reporting items are marked with a red \*.

In the textboxes, either copy & paste the relevant sections from your manuscript into this form - please include any quotes from your manuscript in QUOTATION MARKS, or answer directly by providing additional information not in the manuscript, or elaborating on why the item was not relevant for this study.

YOUR ANSWERS WILL BE PUBLISHED AS A SUPPLEMENTARY FILE TO YOUR PUBLICATION IN JMIR AND ARE CONSIDERED PART OF YOUR PUBLICATION (IF ACCEPTED).

Please fill in these questions diligently. Information will not be copyedited, so please use proper spelling and grammar, use correct capitalization, and avoid abbreviations.

DO NOT FORGET TO SAVE AS PDF \_AND\_ CLICK THE SUBMIT BUTTON SO YOUR ANSWERS ARE IN OUR DATABASE !!!

Citation Suggestion (if you append the pdf as Appendix we suggest to cite this paper in the caption):

Title of your manuscript \*

Provide the (draft) title of your manuscript.

Blended acceptance and commitment therapy versus face-to-face cognitive behavioral therapy for older adults with anxiety symptoms in primary care: a pragmatic single-blind cluster-randomized trial

Name of your App/Software/Intervention \*

If there is a short and a long/alternate name, write the short name first and add the long name in brackets.

Living to the Full / Voluit Leven

**Evaluated Version (if any)**

e.g. "V1", "Release 2017-03-01", "Version 2.0.27913"

Jouw antwoord

**Language(s) \***

What language is the intervention/app in? If multiple languages are available, separate by comma (e.g. "English, French")

Dutch

**URL of your Intervention Website or App**

e.g. a direct link to the mobile app on app in appstore (itunes, Google Play), or URL of the website. If the intervention is a DVD or hardware, you can also link to an Amazon page.

Jouw antwoord

**URL of an image/screenshot (optional)**

Jouw antwoord

**Accessibility \***

Can an enduser access the intervention presently?

- access is free and open
- access only for special usergroups, not open
- access is open to everyone, but requires payment/subscription/in-app purchases
- app/intervention no longer accessible
- Anders:

**Primary Medical Indication/Disease/Condition \***

e.g. "Stress", "Diabetes", or define the target group in brackets after the condition, e.g. "Autism (Parents of children with)", "Alzheimers (Informal Caregivers of)"

Mild to moderately severy psychological comp

**Primary Outcomes measured in trial \***

comma-separated list of primary outcomes reported in the trial

Anxiety symptom severity

**Secondary/other outcomes**

Are there any other outcomes the intervention is expected to affect?

Jouw antwoord

**Recommended "Dose" \***

What do the instructions for users say on how often the app should be used?

- Approximately Daily
- Approximately Weekly
- Approximately Monthly
- Approximately Yearly
- "as needed"
- Anders:

Approx. Percentage of Users (starters) still using the app as recommended after 3 months \*

- unknown / not evaluated
- 0-10%
- 11-20%
- 21-30%
- 31-40%
- 41-50%
- 51-60%
- 61-70%
- 71%-80%
- 81-90%
- 91-100%
- Anders:

Overall, was the app/intervention effective? \*

- yes: all primary outcomes were significantly better in intervention group vs control
- partly: SOME primary outcomes were significantly better in intervention group vs control
- no statistically significant difference between control and intervention
- potentially harmful: control was significantly better than intervention in one or more outcomes
- inconclusive: more research is needed
- Anders:

**Article Preparation Status/Stage \***

At which stage in your article preparation are you currently (at the time you fill in this form)

- not submitted yet - in early draft status
- not submitted yet - in late draft status, just before submission
- submitted to a journal but not reviewed yet
- submitted to a journal and after receiving initial reviewer comments
- submitted to a journal and accepted, but not published yet
- published
- Anders:

**Journal \***

If you already know where you will submit this paper (or if it is already submitted), please provide the journal name (if it is not JMIR, provide the journal name under "other")

- not submitted yet / unclear where I will submit this
- Journal of Medical Internet Research (JMIR)
- JMIR mHealth and UHealth
- JMIR Serious Games
- JMIR Mental Health
- JMIR Public Health
- JMIR Formative Research
- Other JMIR sister journal
- Anders:

Is this a full powered effectiveness trial or a pilot/feasibility trial? \*

- Pilot/feasibility
- Fully powered

Manuscript tracking number \*

If this is a JMIR submission, please provide the manuscript tracking number under "other" (The ms tracking number can be found in the submission acknowledgement email, or when you login as author in JMIR. If the paper is already published in JMIR, then the ms tracking number is the four-digit number at the end of the DOI, to be found at the bottom of each published article in JMIR)

- no ms number (yet) / not (yet) submitted to / published in JMIR
- Anders: 24366

## TITLE AND ABSTRACT

1a) TITLE: Identification as a randomized trial in the title

1a) Does your paper address CONSORT item 1a? \*

I.e does the title contain the phrase "Randomized Controlled Trial"? (if not, explain the reason under "other")

- yes
- Anders:

1a-i) Identify the mode of delivery in the title

Identify the mode of delivery. Preferably use "web-based" and/or "mobile" and/or "electronic game" in the title. Avoid ambiguous terms like "online", "virtual", "interactive". Use "Internet-based" only if Intervention includes non-web-based Internet components (e.g. email), use "computer-based" or "electronic" only if offline products are used. Use "virtual" only in the context of "virtual reality" (3-D worlds). Use "online" only in the context of "online support groups". Complement or substitute product names with broader terms for the class of products (such as "mobile" or "smart phone" instead of "iphone"), especially if the application runs on different platforms.

### Does your paper address subitem 1a-iii? \*

Copy and paste relevant sections from manuscript title (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

It states 'older adults with anxiety symptoms'

### 1b) ABSTRACT: Structured summary of trial design, methods, results, and conclusions

NPT extension: Description of experimental treatment, comparator, care providers, centers, and blinding status.

### 1b-i) Key features/functionalities/components of the intervention and comparator in the METHODS section of the ABSTRACT

Mention key features/functionalities/components of the intervention and comparator in the abstract. If possible, also mention theories and principles used for designing the site. Keep in mind the needs of systematic reviewers and indexers by including important synonyms. (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

1      2      3      4      5

subitem not at all important                        essential

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Jouw antwoord

### 1b-iii) Open vs. closed, web-based (self-assessment) vs. face-to-face assessments in the METHODS section of the ABSTRACT

Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic or a closed online user group (closed usergroup trial), and clarify if this was a purely web-based trial, or there were face-to-face components (as part of the intervention or for assessment). Clearly say if outcomes were self-assessed through questionnaires (as common in web-based trials). Note: In traditional offline trials, an open trial (open-label trial) is a type of clinical trial in which both the researchers and participants know which treatment is being administered. To avoid confusion, use "blinded" or "unblinded" to indicated the level of blinding instead of "open", as "open" in web-based trials usually refers to "open access" (i.e. participants can self-enrol). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5

## INTRODUCTION

### 2a) In INTRODUCTION: Scientific background and explanation of rationale

### 2a-i) Problem and the type of system/solution

Describe the problem and the type of system/solution that is object of the study: intended as stand-alone intervention vs. incorporated in broader health care program? Intended for a particular patient population? Goals of the intervention, e.g., being more cost-effective to other interventions, replace or complement other solutions? (Note: Details about the intervention are provided in "Methods" under 5)

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	essential

### Does your paper address subitem 2a-i? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Anxiety is among the most common mental health problems in older adults, with prevalence estimates for anxiety disorders ranging up to 15% [1-3]. When also considering the presence of anxiety symptoms that do not meet diagnostic criteria for a disorder (so called subclinical or subthreshold anxiety) estimates even range between 15% and 52% [1,3]. Both anxiety disorders and subclinical anxiety in older adults are associated with limited physical and social activities, impairments in self-care, decreased well-being, comorbid depressive symptomatology, somatic problems and increased use of benzodiazepines [4-6]. Despite the repeatedly demonstrated negative impact of late-life anxiety, only a small proportion of anxious older adults receive adequate psychological help [7-9]. This treatment gap is worrying as untreated anxiety symptoms in older adults tend to be chronic and aggravate with time [10]."

## 2a-ii) Scientific background, rationale: What is known about the (type of) system

Scientific background, rationale: What is known about the (type of) system that is the object of the study (be sure to discuss the use of similar systems for other conditions/diagnoses, if appropriate), motivation for the study, i.e. what are the reasons for and what is the context for this specific study, from which stakeholder viewpoint is the study performed, potential impact of findings [2]. Briefly justify the choice of the comparator.

"A promising alternative to CBT is acceptance and commitment therapy (ACT), a treatment that has been found effective in reducing anxiety symptoms in general adult samples [21,22]. Where CBT focuses on reevaluating cognitions and changing safety behaviour and avoidance in order to achieve extinction of anxiety, ACT promotes acceptance-based emotion-regulation and valued engagement in life [23]."

"So far, studies in older adults with heterogeneous anxiety symptomatology found online CBT-modules combined with guidance from a clinician to be effective in reducing symptom severity [12-15]. These results are promising, as scalable (partly) online interventions might be invaluable in bridging the current treatment gap in a cost-effective way."

## 2b) In INTRODUCTION: Specific objectives or hypotheses

Does your paper address CONSORT subitem 2b? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"We expect the ACT-intervention to be more effective than CBT."

## METHODS

**3a) Description of trial design (such as parallel, factorial) including allocation ratio**

Does your paper address CONSORT subitem 3a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"The study was designed as a pragmatic single-blind cluster-randomized controlled trial with measurements at baseline (T0) and follow-ups at 3, 6 and 12 months (T1, T2, T3) post baseline. Randomization took place at the level of mental health counselors working at general practices, creating clusters of participants that received treatment from the same counselor. Power analysis showed that assuming clusters of five patients per counselor and an intraclass correlation coefficient of 0.01, 240 participants (36 counselors) were required to detect a between-group difference on the Generalized Anxiety Disorder-7 (GAD-7) at post-treatment with a medium effect size ( $d=0.45$ ), a two-tailed alpha of 0.05 and a power of 0.80 [34]."

**3b) Important changes to methods after trial commencement (such as eligibility criteria), with reasons**

**Does your paper address CONSORT subitem 3b? \***

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Not applicable

**3b-i) Bug fixes, Downtimes, Content Changes**

Bug fixes, Downtimes, Content Changes: ehealth systems are often dynamic systems. A description of changes to methods therefore also includes important changes made on the intervention or comparator during the trial (e.g., major bug fixes or changes in the functionality or content) (5-iii) and other "unexpected events" that may have influenced study design such as staff changes, system failures/downtimes, etc. [2].

**4a) Eligibility criteria for participants**

### Does your paper address CONSORT subitem 4a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Individuals aged 55–75 years with mild to moderately severe anxiety symptoms (GAD-7 between 5 and 15 [36]) were eligible for participation. Mastery of the Dutch language, Internet access and motivation to spend 2.5 hours per week on the intervention were also required. Exclusion criteria were: severe cognitive impairment or unstable severe medical condition(s) (according to the medical record at the general practice); very mild or severe anxiety symptoms (Generalized Anxiety Disorder-7 (GAD-7) score  $< 5$  /  $> 15$  [36]); severe depressive symptomatology (Patient Health Questionnaire-9 (PHQ-9) score  $\geq 20$  [37]); having received psychological or psychopharmacological treatment within the last three months, with the exception of stable benzodiazepine or SSRI use; severe functional impairment (score  $\geq 8$  on two or three Sheehan Disability Scale (SDS) domains [38]); high suicide risk (MINI-International Neuropsychiatric Interview (MINI-Plus)) [39]; substance use disorder (MINI-Plus); lifetime diagnosis of bipolar disorder or schizophrenia (medical record or MINI-Plus)."

#### 4a-i) Computer / Internet literacy

Computer / Internet literacy is often an implicit "de facto" eligibility criterion - this should be explicitly clarified.

Does your paper address subitem 4a-ii? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Patients (aged 55-75) from participating general practices were sent an information letter about the study. A datamanager assisted the general practitioner (GP) in preparing and sending the letters in accordance with Dutch privacy legislation. Patients whose medical records mentioned a lifetime diagnosis of bipolar disorder or schizophrenia, severe unstable medical condition(s) or severe cognitive impairment did not receive an invitation letter. GP's could also exclude patients from the mailing for other reasons (e.g. social circumstances or language barriers) and had to give written approval of the final mailing list.

The letters referred people to the study-website for detailed information about the study and to register for participation. After registration a screening followed, consisting of online questionnaires (assessing anxiety severity (GAD-7), depression severity (PHQ-9), mastery of Dutch and motivation for treatment) and a telephone interview (assessing medication use, functional impairment (SDS) and presence of psychiatric disorders (MINI-PLUS)). If excluded for presence of severe symptomatology, people were referred to their GP to discuss other treatment options. Online informed consent was obtained from all eligible participants before they completed the online baseline questionnaire and were informed about their treatment allocation by the main researcher. The main researcher then informed the general practice about the inclusion."

#### 4a-iii) Information giving during recruitment

Information given during recruitment. Specify how participants were briefed for recruitment and in the informed consent procedures (e.g., publish the informed consent documentation as appendix, see also item X26), as this information may have an effect on user self-selection, user expectation and may also bias results.

"The online module "Living to the Full" is an adaptation of the similarly titled self-help book [40,41] and was proven effective in reducing distress [42,43]. It consists of 9 lessons to be completed in 9 to 12 weeks. Completing the lessons in time required the participants to spend 15-30 minutes on the module each day. Lessons are based on the 6 core processes of ACT: acceptance, cognitive defusion, contact with the present moment, self-as-context, values and committed action. Every lesson contains information texts and -videos, mindfulness, and experiential and motivational exercises. The module was combined with 4 face-to-face sessions with the mental health counselor, for which a treatment protocol was developed by the authors of "Living to the Full". In the first session, the participant's complaint(s) were inventoried and the online program was introduced. The other three sessions served to repeat key exercises, increase motivation, evaluate progress, and discuss potential problems. "

### 5-viii) Mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework

Describe mode of delivery, features/functionalities/components of the intervention and comparator, and the theoretical framework [6] used to design them (instructional strategy [1], behaviour change techniques, persuasive features, etc., see e.g., [7, 8] for terminology). This includes an in-depth description of the content (including where it is coming from and who developed it) [1], "whether [and how] it is tailored to individual circumstances and allows users to track their progress and receive feedback" [6]. This also includes a description of communication delivery channels and – if computer-mediated communication is a component – whether communication was synchronous or asynchronous [6]. It also includes information on presentation strategies [1], including page design principles, average amount of text on pages, presence of hyperlinks to other resources, etc. [1].

**6a) Completely defined pre-specified primary and secondary outcome measures, including how and when they were assessed**

Does your paper address CONSORT subitem 6a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Table 1 presents an overview of the instruments per measurement moment. Anxiety symptom severity was assessed with the GAD-7 (total scores 0-21, higher scores indicating higher symptom severity [36]. Positive mental health was measured with the Mental Health Continuum Short-Form (MHC-SF; total scores (range 0-5) obtained by averaging the sumscore of the fourteen 6 point items, with higher socres indicating higher levels of positive mental health [44]). Depressive symptoms were assessed with the PHQ-9 (total scores 0–27, higher scores reflecting higher symptom severity [37]). The SDS [38] assessed functional impairment in the domains of work, social life and family life (scores on each domain range 0–10, higher scores reflecting more impairment). Presence of current generalized anxiety disorder, panic disorder, agoraphobia, specific phobia, social phobia, obsessive-compulsive disorder, post-traumatic stress disorder and illness anxiety disorder according to DSM-V criteria was assessed with the MINI-plus [39]. Treatment satisfaction was assessed with the Client Satisfaction Questionnaire-8 (CSQ-8; total scores 0–32, higher scores indicating higher satisfaction [45]). To assess treatment integrity, mental health counselors indicated after every session how closely they had followed the treatment protocol on a check-list with all the elements the protocol prescribed for that session. Secondary outcomes not reported on in this article are mindfulness, experiential avoidance, cognitive emotion regulation, medical costs and quality of life. These outcomes will be used in subsequent articles on moderator, mediator and cost-effectiveness analyses. "

6a-i) Online questionnaires: describe if they were validated for online use and apply CHERRIES items to describe how the questionnaires were designed/deployed

If outcomes were obtained through online questionnaires, describe if they were validated for online use and apply CHERRIES items to describe how the questionnaires were designed/deployed [9].

"In addition, participants were given homework exercises that required 15-30 minutes per day (i.e., a similar time investment as the Blended ACT intervention)"

"Mental health counselors received a six hour-long in-person training in working with the treatment protocol for their allocated treatment."

## 12a) Statistical methods used to compare groups for primary and secondary outcomes

NPT: When applicable, details of whether and how the clustering by care providers or centers was addressed

Does your paper address CONSORT subitem 12a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Statistical analyses were performed with R software [35]. Differences between conditions over time on continuous outcomes were examined with linear mixed models. The time variable was recoded into three contrasts: T0-T1 (baseline to posttreatment), T1-T2 (posttreatment to six month follow-up) and T1-T3 (posttreatment to twelve month follow-up). Functional impairment was not assessed at T2, so these analyses included two contrasts (T0-T1 and T1-T3). The condition variable was effect coded (CBT=-0.5, ACT=0.5) to make the coefficients for the time variables reflect true main effects. Time, condition and their interaction were included as fixed effects. Random intercepts were included for the participant level and mental health counselor level. Random slopes for time were included for mental health counselors, but not for participants, as this would result in more parameters than observations. Treatment satisfaction was only assessed at T1, so this model included no time effects and only a random intercept at the counselor level. For this model, condition was dummy coded (CBT=0, ACT=1). Mixed effects logistic regression was used to examine if proportions of participants that changed from 'anxiety disorder' to 'no anxiety disorder' -and vice versa- differed between groups. Four separate models were created to examine differences between the conditions at T1 and T3 for participants with an without an anxiety disorder. "

### 12a-i) Imputation techniques to deal with attrition / missing values

Imputation techniques to deal with attrition / missing values: Not all participants will use the intervention/comparator as intended and attrition is typically high in ehealth trials. Specify how participants who did not use the application or dropped out from the trial were treated in the statistical analysis (a complete case analysis is strongly discouraged, and simple imputation techniques such as LOCF may also be problematic [4]).

## RESULTS

### 13a) For each group, the numbers of participants who were randomly assigned, received intended treatment, and were analysed for the primary outcome

NPT: The number of care providers or centers performing the intervention in each group and the number of patients treated by each care provider in each center

### Does your paper address CONSORT subitem 13a? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

This is presented in a flowchart , that i can not paste in this form

### 13b) For each group, losses and exclusions after randomisation, together with reasons

Does your paper address CONSORT subitem 13b? (NOTE: Preferably, this is shown in a CONSORT flow diagram) \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Figure 1 presents a flowchart of participants. From November 2017 to March 2019 35,820 invitation letters were sent. A total of 683 people were screened, of which 330 were excluded. Of the 353 eligible participants, 39 did not give informed consent, resulting in a total of 314 included participants. A total of 150 participants were assigned to the ACT-condition, 164 to CBT. Table 2 presents the demographic and clinical characteristics of the sample. Thirteen participants in the ACT condition and 17 in the CBT condition never started treatment, because they did not show up for the first appointment and afterwards indicated they wanted to stop their participation/were not reachable by phone and e-mail to discuss further participation. At T1, 71% (n=222) of the participants completed the online questionnaire (ACT 67%, CBT 74%); at T2, 64% (n=200; ACT 59%, CBT 68%), and at T3, 57% (n=178; ACT 55%, CBT 59%). The telephone interviews at T1 and T3 were completed by 66% (n=208; ACT 61%, CBT 70%) and 45% (n=140; ACT 46%; CBT 43%), respectively."

13b-i) Attrition diagram

Strongly recommended: An attrition diagram (e.g., proportion of participants still logging in or using the intervention/comparator in each group plotted over time, similar to a survival curve) or other figures or tables demonstrating usage/dose/engagement.

We included this information in a table, that cannot be pasted into this form

#### 15-i) Report demographics associated with digital divide issues

In ehealth trials it is particularly important to report demographics associated with digital divide issues, such as age, education, gender, social-economic status, computer/Internet/ehealth literacy of the participants, if known.

#### Does your paper address subitem 15-i? \*

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

From November 2017 to March 2019 35,820 invitation letters were sent.

### 16) For each group, number of participants (denominator) included in each analysis and whether the analysis was by original assigned groups

### 16-i) Report multiple “denominators” and provide definitions

Report multiple “denominators” and provide definitions: Report N’s (and effect sizes) “across a range of study participation [and use] thresholds” [1], e.g., N exposed, N consented, N used more than x times, N used more than y weeks, N participants “used” the intervention/comparator at specific pre-defined time points of interest (in absolute and relative numbers per group). Always clearly define “use” of the intervention.

This is stated in the participant flowchart that can not be pasted

### 16-ii) Primary analysis should be intent-to-treat

Primary analysis should be intent-to-treat, secondary analyses could include comparing only “users”, with the appropriate caveats that this is no longer a randomized sample (see 18-i).

Presented in a table that can not be pasted here

**17a-i) Presentation of process outcomes such as metrics of use and intensity of use**

In addition to primary/secondary (clinical) outcomes, the presentation of process outcomes such as metrics of use and intensity of use (dose, exposure) and their operational definitions is critical. This does not only refer to metrics of attrition (13-b) (often a binary variable), but also to more continuous exposure metrics such as "average session length". These must be accompanied by a technical description how a metric like a "session" is defined (e.g., timeout after idle time) [1] (report under item 6a).

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"PP-analyses included 226 participants (ACT n=100; CBT n=126). PP-participants did not differ significantly from other participants regarding baseline characteristics. PP-analyses replicated all findings from the ITT-analyses."

18-i) Subgroup analysis of comparing only users

A subgroup analysis of comparing only users is not uncommon in ehealth trials, but if done, it must be stressed that this is a self-selected sample and no longer an unbiased sample from a randomized trial (see 16-iii).

"This study evaluated the short- and long-term effectiveness of a blended ACT-intervention for older adults with mild to moderately severe anxiety symptoms by comparing it to face-to-face CBT. We found changes over time in anxiety symptom severity to be similar in the ACT and CBT-group. In both groups, anxiety scores significantly decreased from baseline to posttreatment and effect sizes for these decreases were large. At twelve-month follow-up, symptom reduction was maintained in both groups. Furthermore, rates of reliable improvement and clinically significant change of anxiety symptoms did not differ between groups. Analyses of secondary outcomes revealed two significant differences between the conditions. First, improvements in positive mental health were better sustained in the long-term in the ACT-group. Second, treatment satisfaction was higher for the ACT-intervention than for CBT. No other significant differences between the groups on the secondary outcomes were found. Both groups showed significant improvements regarding depression severity, functional impairment and positive mental from baseline to posttreatment which were mostly sustained or increased at follow-up. Lastly, the proportions of participants that met criteria for a DSM-V anxiety disorder at baseline and no longer did so after treatment were also similar in the ACT and CBT-group. "

22-ii) Highlight unanswered new questions, suggest future research

Highlight unanswered new questions, suggest future research.

## 20) Trial limitations, addressing sources of potential bias, imprecision, and, if relevant, multiplicity of analyses

### 20-i) Typical limitations in ehealth trials

Typical limitations in ehealth trials: Participants in ehealth trials are rarely blinded. Ehealth trials often look at a multiplicity of outcomes, increasing risk for a Type I error. Discuss biases due to non-use of the intervention/usability issues, biases through informed consent procedures, unexpected events.

"This study has several limitations. First, treatment integrity was assessed suboptimally because it relied on therapists' self-report. Second, of the 35,820 people that received an information letter, 683 registered for study participation, which is a small group considering the high prevalence of late-life anxiety [1-3]. It is likely that this group differs from the study population as a whole. For example, all participants were community-dwelling, 98% were of Dutch nationality and most had middle to high education levels. The generalizability of the findings is also limited because the more severely (psychologically and/or physically) impaired older adults and those over the age of 75 were excluded from participation. Lastly, a considerable amount of participants (although comparable to other studies on Internet-based and low-threshold/low-intensity interventions in general [57,58]) dropped-out before completing treatment and only one third of them reported their reason for drop-out."

21) Generalisability (external validity, applicability) of the trial findings

NPT: External validity of the trial findings according to the intervention, comparators, patients, and care providers or centers involved in the trial

21-i) Generalizability to other populations

Generalizability to other populations: In particular, discuss generalizability to a general Internet population, outside of a RCT setting, and general patient population, including applicability of the study results for other organizations

### 21-ii) Discuss if there were elements in the RCT that would be different in a routine application setting

Discuss if there were elements in the RCT that would be different in a routine application setting (e.g., prompts/reminders, more human involvement, training sessions or other co-interventions) and what impact the omission of these elements could have on use, adoption, or outcomes if the intervention is applied outside of a RCT setting.
