

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

Abstract

Objectives: To explore hospital staff, volunteer and stroke survivor perceived barriers and facilitators to stroke survivor communication in an acute and a rehabilitation ward setting.

Design: A qualitative descriptive sub-study within a larger study which aimed to develop and test a Communication Enhanced Environment in an acute and a rehabilitation ward.

Setting: A metropolitan Australian private hospital.

Participants: Acute and rehabilitation doctors, nurses, allied health staff and volunteers were purposively recruited. Seven stroke inpatients, including three with aphasia, were consecutively recruited.

Results: Hospital staff and volunteer focus groups and interviews, and patient interviews were conducted. The key themes related to barriers and facilitators to communication, contained sub-categories related to hospital, staff and patient factors. Hospital related barriers to communication were private rooms, mixed wards, the physical hospital environment, hospital policies, the power imbalance between staff and patients, and task specific communication. Staff related barriers to communication were staff's perception of time pressures, underutilisation of available resources, staff individual factors such as personality, role perception and lack of knowledge and skills regarding communication strategies. The patient related barrier to communication involved patients' functional and medical status. Hospital related facilitators to communication were shared rooms/co-location of patients, visitors and volunteers. Staff related facilitators to communication were utilisation of resources, speech pathology support, staff knowledge and utilisation of communication strategies and individual staff factors such as personality.

Conclusions: Barriers and facilitators to communication appeared to be interconnected and likely to influence one another suggesting that the level of communication access may vary from patient to patient within the same setting.

Study strengths

- This study involved a large number of staff in comparison to previous studies^{12, 13} and included volunteers working within the acute and rehabilitation wards as well stroke in-patients.
- Data saturation was reached within the staff focus groups.

Study limitations

- Small numbers of medical (n=2) and nursing staff (n= 11) were recruited compared to allied health staff (N= 32) which may be reflected in the results.
- This study involved a small number of stroke participants; a broader range of perspectives may have been expressed with a larger number of participants.
- This study was conducted at a private hospital involving a mixed acute and a mixed rehabilitation ward. These results reflect this context and may not be directly generalisable to hospitals in the public sector.

Background

Stroke survivors in hospital spend on average 65-94% of their day inactive.¹ Despite improvements in functional independence during their hospital admission, stroke survivors' engagement in cognitive and social activity remains largely unchanged.² Stroke survivors with aphasia spend two thirds less time engaged in social interactions with family and friends compared to stroke survivors without aphasia.³

Stroke survivors have described time outside therapy as "dead" and "wasted", reporting a lack of stimulation and inactivity in hospital impacting their ability to self-direct their rehabilitation outside of therapy.⁴ A lack of social and cognitive activity early after stroke for stroke patients with aphasia has the potential to contribute to: i) the development of maladaptive compensatory communication behaviours, and ii) the learned non-use of language, which may ultimately impact on their quality of life and overall language recovery.³

This study aimed to explore hospital staff and volunteer, and stroke patient perceptions of barriers and facilitators to stroke patient communication in an acute and a rehabilitation hospital ward. Identifying barriers and facilitators to stroke inpatient communication will inform the development of a Communication Enhanced Environment (CEE) for the purposes of increasing stroke survivor engagement in language activity within a hospital ward to maximise post-stroke aphasia language recovery.

Methods

Design

This was a sub-study of a larger study which aimed to develop and test a CEE within an acute and a rehabilitation ward (see supplementary file for study protocol and procedure). This sub-study contributed to the baseline phase of the larger study outlined below:

- i) *Baseline phase:* observe and quantify stroke patients' engagement in language activity in the acute and rehabilitation ward environments and explore hospital staff and volunteer, and stroke patients' perceptions of barriers and facilitators to communication in hospital;
- ii) *Implementation phase:* develop and implement the CEE on the acute and rehabilitation wards;

- 1
2
3 *iii) Post-implementation phase: assess the impact of the CEE on stroke patient*
4 *engagement in language activity, and hospital staff and patients' perceptions of*
5 *barriers to communication in hospital.*
6
7

8 **Research authors' relationship with participants**

9
10 The first author who was external to the hospital conducted focus groups and
11 interviews. The first author engaged key hospital team members for the duration of the
12 study to inform the study design to ensure it aligned with the hospital policies and priorities.
13
14

15 **Public and patient involvement**

16
17 The public and patients were not involved in the design of this study however this
18 data informed the development of the CEE model in the larger study. A working group
19 consisting of key members of the stroke multidisciplinary team provided feedback on this
20 study's findings and were involved in the development of the CEE model and embedding
21 approach, which was based on the outcomes of this sub-study. Dissemination of the final
22 results of this sub-study will be provided on completion of the larger study.
23
24
25
26
27
28

29 **Setting**

30
31 This study was conducted on an acute and a rehabilitation ward at a private hospital
32 in Perth, Western Australia. The acute ward was a 26- bed unit with acute stroke and
33 medical patients. The acute ward had four individual rooms and nine shared rooms, two
34 rooms with four beds per room, and seven rooms with two beds per room. Patients ate
35 meals in their rooms and had access to an outdoor balcony area. The rehabilitation ward
36 was a 44-bed mixed rehabilitation unit for medical, orthopaedic, post-surgical and stroke
37 patients. There were thirty-six individual rooms, and four shared rooms with two beds in
38 each room. Patients had breakfast in their rooms but were encouraged to eat lunch and
39 dinner in one of two communal dining areas.
40
41
42
43
44
45
46

47 **Participants**

48
49 *Hospital staff participants:* Purposeful sampling of acute and rehabilitation hospital
50 staff was conducted to include at least one representative from each acute and
51 rehabilitation staff group including medical, nursing, volunteers, and allied health staff
52 members who were over 18 years of age. A total of 51 staff and volunteers were recruited
53 (Table 1.) by contacting staff department managers who identified staff currently working or
54 had previously worked with stroke patients on the acute or rehabilitation wards.

Stroke patient participants: All consecutively admitted stroke patients from January to February 2016, and June 2016 to July 2017 were screened for eligibility to participate in the study. Inclusion criteria: i) admitted to the acute or rehabilitation ward with an acute stroke, ii) less than 21 days post-stroke during data collection, iii) able to provide informed consent based on the judgement of the medical team responsible for the medical management of the patient, iv) Glasgow Coma Scale⁶ greater than 10, v) estimated total length of hospital stay greater than 14 days, vi) adequate English proficiency to participate in interviews as determined by managing speech pathologist or medical team. Exclusion criteria: i) uncorrected hearing or vision (for example hearing impairment without the use of hearing aids or vision impairment without the use of glasses), ii) medically unstable, iii) documented diagnosis of current untreated depression, documented diagnosis of dementia, previous aphasia or traumatic brain injury. The diagnosis of aphasia was confirmed for those who achieved a Western Aphasia Battery-Revised⁷ Aphasia Quotient score less than 93.7. A total of 9 stroke participants were recruited, however 2 stroke participants were withdrawn as they became medically unwell. Data collection was completed for 4 stroke patients without aphasia and 3 stroke patients with aphasia. See Figure 1. for the summary of stroke participant screening and recruitment. Stroke participant details and demographics are detailed in Table 2.

No staff or stroke participants withdrew from participating in this study.

Data collection

The first author, a female speech pathologist (Bachelor of Speech Pathology, First Class Honours) and PhD student with seven years clinical experience working in the hospital setting and five years research experience, including conducting interviews and focus groups, completed all semi-structured interviews and focus groups. Staff were informed that the researchers wanted to investigate their perceptions of the hospital ward environment in regards to communication opportunities to inform the development of a Communication Enhanced Environment (see supplementary file for staff and volunteer information and consent forms). Stroke patients were informed that the researchers wanted to explore how the hospital environment influenced patient activity (see supplementary file for stroke patient information and consent forms).

All interviews and focus groups were conducted using interview and focus group guides (staff focus groups and interview guide Appendix A., patient interview guide

1
2
3 Appendix B.) and were audio recorded. Field notes were completed by the first
4 author during data collection. Seven staff focus groups were conducted with two to eight
5 participants in each focus group. One-on-one interviews were conducted with two staff
6 members. All staff focus groups were completed on the hospital site in various locations
7 that were private and quiet. Six out of seven stroke patient interviews were conducted in
8 person during their inpatient admission in their hospital room, and one was completed over
9 the phone (stroke patient without aphasia) one day following discharge from hospital. All
10 patient interviews were conducted within fifteen days post-stroke. Interview and focus
11 groups were 20-60 minutes long, often varying based on the number of participants.
12 Supported conversation strategies¹⁰ were used during interviews with PWA to facilitate
13 their participation in the interview. One PWA had two family members present during the
14 interview. Member checking was conducted during the interviews through clarifying
15 questions and paraphrasing comments for confirmation by participants.

26 **Data analysis**

27 Focus groups and interviews were transcribed verbatim. Responses to any leading
28 questions were removed from the data set.¹¹

29 The theoretical framework for this research was a qualitative description approach.¹²
30 This approach involves describing patient experiences, with minimal interpretation of the
31 data to minimise potential bias of the researchers.¹² Participant experiences were analysed
32 using NVivo¹⁰ computer software to manage the data. Data were grouped into themes
33 according to content.¹¹ The first level of coding identified the broad content of the data then
34 sub-categories were identified.¹¹ Single lines of data were not removed from their 'story'
35 during data analysis to maintain the context and help ensure meaning was not lost or
36 misinterpreted.¹¹ Ongoing critical review of the categories were conducted and themes
37 were reviewed by a second researcher.¹²

48 **Results**

49 The key themes from the focus group and interviews related to barriers and
50 facilitators to communication, with sub-categories identified which related to hospital, staff
51 and patient factors (Figure 2.).

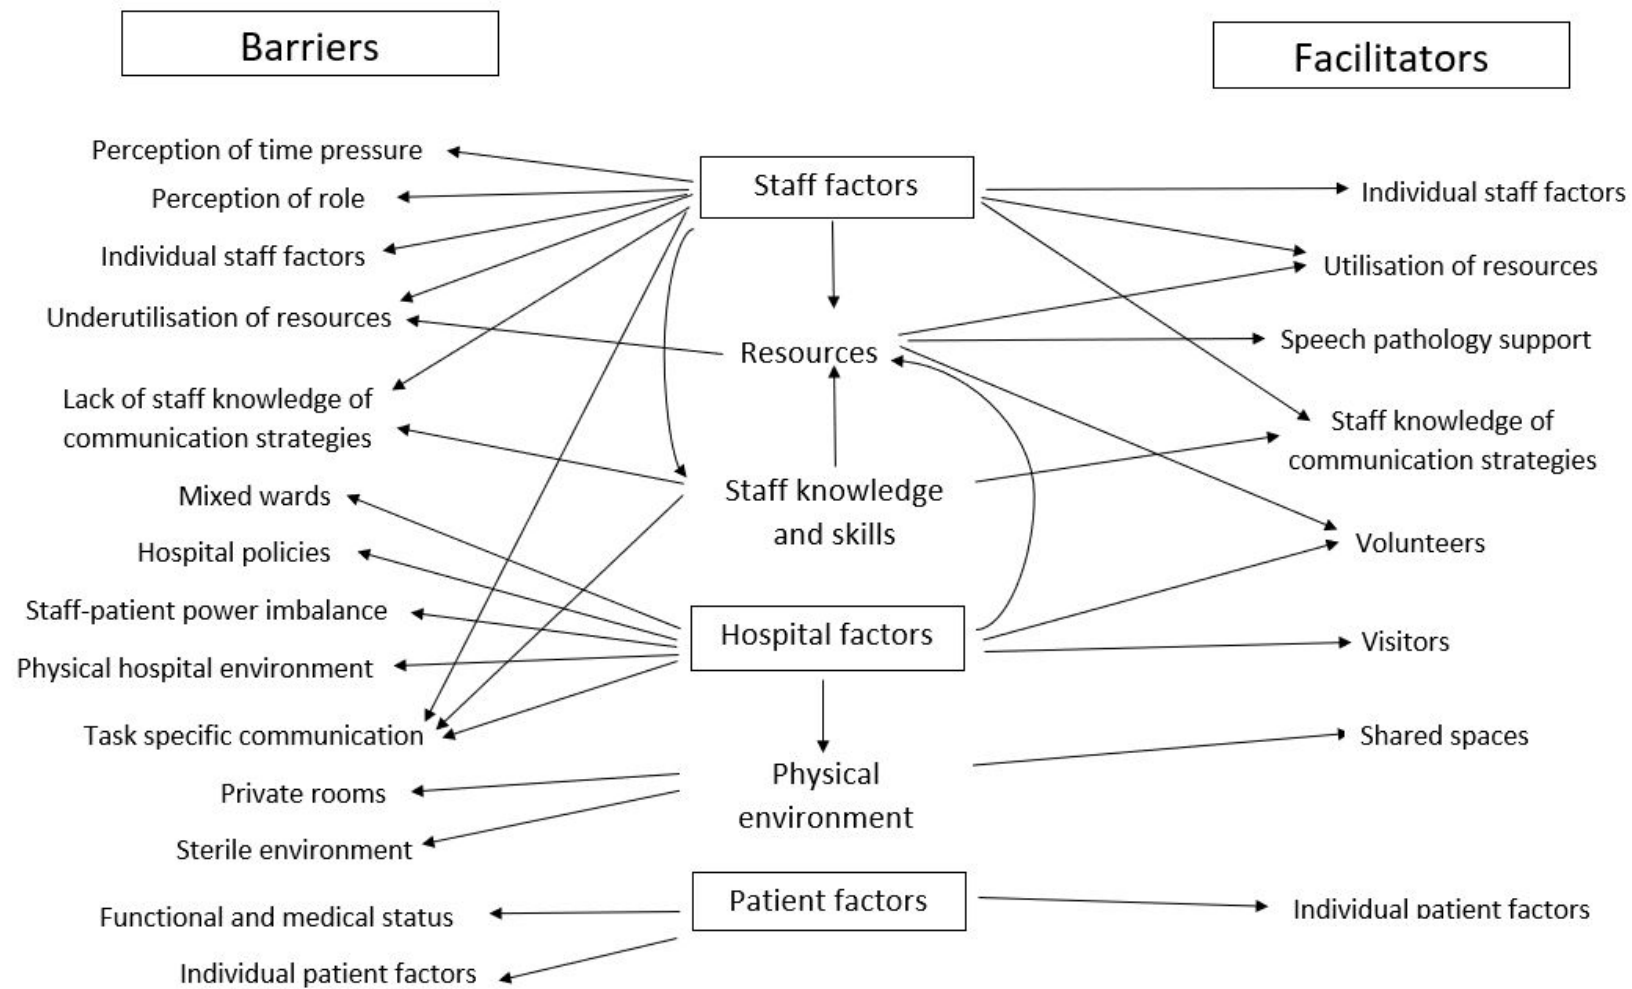

Figure 2. Summary of themes and subthemes of staff and patient perceptions to barriers and facilitators to stroke inpatient communication and language activities.

Barriers to Communication

Hospital related factors

Private rooms reduce opportunities for social interaction

Staff and patients described the impact of single rooms which limited incidental socialisation with other patients and their visitors.

We used to co-locate our stroke patients and often using our shared rooms. That's when people had more opportunities for interacting with one another. (MedC1)

Mixed wards affect staff acquisition of specialist skills

Staff described their perception of the negative effect a mixed hospital ward had on the acquisition of stroke specific specialist skills.

Having a stroke specific ward... everybody on the ward would be trained...and that's the only thing they'd have to focus on rather than having lots of other patients with lots of medical conditions. (OT4)

Hospital environment does not encourage socialising

Staff talked about the physical hospital ward environment affecting social interaction as it contributed to a sterile atmosphere rather than one that promoted social activity. Staff also talked about the consequence of background noise and environmental distractors in large shared rooms on the acute ward which reduced their ability to communicate with stroke patients with communication impairments.

My general feeling of rehab [rehabilitation] is that they come to their sessions and then they go back to their lonely dark room... I don't really see the rooms as a particularly happy, busy place where they are getting a lot out of being in there... the dining rooms... they're not a particularly pleasant place to be either. (PT2)

Hospital policies restrict the development of communication-promoting ideas and initiatives

Hospital policies were perceived by staff as a barrier to communication, negatively influencing their ability to develop ideas and initiatives to increase patients' opportunities for social interaction.

It's just every time you try and do something you hit a barrier... you do try and think outside the box what more can you do for this patient and you get another hospital rule. (PT2)

Power imbalance of staff and patients in hospital controls patients' ability to access communication opportunities

Staff and patients discussed the influence of the power imbalance for patients in hospital, and patient perceptions that they have to do what is expected in the hospital environment. This appeared to limit the patients' ability to freely engage and explore the environment resulting in patients retreating to their rooms and limiting their opportunities to engage in activities.

I think most males like to account for their time um and I felt like I haven't been able to do that and that's, that's the bit that I'm really, really lacking. (PWA2)

I was in the hospital so I think I had to stick into the room, to the rules. (PWOA2)

Very often when you're in a hospital you do what you think you're expected to do. (SP4)

Task specific communication reduces patients' communication opportunities

Staff talked about the nature of interactions with patients as often being driven by the patient's care, restricting opportunities for communication beyond this context.

I know we aim to be very holistic... but very often care is very[sic] directed from a medical health care perspective (SP4)

Staff related factors

Staff's perception of time pressures limiting opportunities for communication

Both patients and staff perceived staff time pressures as a barrier negatively effecting communication on the wards. Some staff reported that they felt interactions with patients with communication impairments required extra time which was challenging in a time pressured hospital environment. Time pressures were also perceived to restrict the staff's ability to facilitate opportunities for patients to socialise with other patients. For example, nurses appeared to deprioritise transferring patients to the communal area for lunch in busier times.

If they're hoist patients it might not be as easy for staff to get them to the dining room, that wouldn't totally prevent someone from going, it would just depend on the time that people had on the day. (SW3)

Staff and patient's underutilisation of available resources

Staff described the lack of accessible resources as a factor negatively affecting staff-patient communication. They described the need for resources when communicating with

1
2
3 patients with aphasia and other communication impairments. They also described a number
4 of resources that they felt patients were not aware of and therefore did not utilise.
5

6
7 There are all of these opportunities but I don't think a lot of the patients access them
8 so it sounds like great communicative opportunities for them but the reality is that a
9 lot of them are sitting in their rooms most of the times by themselves watching
10 television and most of the interactions they have is with the nurses or just whoever
11 comes in to see them. (SP4)
12
13
14
15

16 **Individual staff factors leading to restricted opportunities for communication**

17
18 Staff described individual staff factors such as personality, values and attitudes
19 influencing communication opportunities for stroke patients, such as staff providing
20 patients with opportunities for incidental social interaction during routine tasks.
21

22
23 Often if people need to go in and see the patient let's just say to take obs
24 [observations] or to do a wash... they don't always use that opportunity as an
25 opportunity to chat... there could be more opportunity to chat at those times whilst
26 they are doing what they need to get done and you know that varies from person to
27 person, personality as well and how busy people are, what else is going on. (SP3)
28
29
30
31

32 **Staff's perception their role does not include communication tasks**

33
34 Some staff perceived communication as a task separate from the responsibility of their role
35 therefore limiting their facilitation of communication opportunities for stroke patients.
36

37
38 They [speech pathologists] do their bit and we do ours... we don't have time to
39 practice speech with them because we really do have to get all of our jobs filled in
40 the time and it's specifically rostered for us to do our work, not to help with
41 someone else's. (RehabN1)
42
43
44

45 **Lack of staff knowledge and skills resulting in unsuccessful communication interactions or 46 avoiding communication interactions**

47
48 Staff described a lack of knowledge and skills in communicating with stroke patients with
49 communication impairments. Some staff reported feeling anxious about encouraging
50 patients to communicate as communication breakdowns may cause stress and anxiety for
51 the patient, and the staff member. Staff reported a lack of confidence in their ability to
52 repair communication breakdowns which resulted in increased time pressures in their
53 sessions, often leading them to avoid encouraging communication interactions within their
54 treatment sessions.
55
56
57
58
59
60

1
2
3 I find it challenging... knowing how the best way to communicate with that person
4 [with aphasia]... then [they] become very frustrated and not have the tools
5 themselves to communicate back to me and you would never want to leave
6 someone in that space. So that's something that I struggle with. (SW2)
7
8
9

10 **Patient related factors**

11 **Patients' functional and medical status limiting their ability to seek out and engage in** 12 **activities**

13
14
15
16 Staff and patients perceived patients' medical status as a barrier to communication
17 by limiting their ability to engage with their environment including independently seeking
18 out activities and being able to utilise communal areas.
19

20
21 If someone is bed bound, you know the interaction is very minimal... you often walk
22 past and you see them alone in their room... you wonder what happens during those
23 periods of time where they're just in their room and they don't have family. (OT2)
24

25
26 Well I can't do anything cos I can't go off by myself and do anything. (PWOA2)
27

28 **Individual patient factors limiting opportunities for communication**

29
30 Staff described individual patient factors such as personality, mood and motivation
31 communication opportunities for stroke patients such as independent practice of
32 communication therapy tasks, and social opportunities with patients and hospital staff.
33

34
35 We have to recognise some patients who have had strokes ... they're fed up with
36 having people poking and prodding them then have a volunteer and go "do you want
37 to do your exercises for speech?" (VM)
38
39

40 **Facilitators to Communication**

41 **Hospital related factors**

42 **Shared rooms/co-location encourages incidental social interactions**

43
44 Staff talked about use of communal areas at other hospitals which facilitated socialisation
45 and communication during non-therapy times and during group therapy. Staff described the
46 importance of the use of communal areas given the large number of private rooms on the
47 ward. Patients also described the need to be co-located to promote social interaction.
48

49
50 I think that, put the [sic] whole lot of people together and ah and they [sic]
51 something collective, that's what human beings are put together for ... sitting around
52 talking... over the proverbial cuppa. (PWA2)
53
54

55 **Visitors provide patients opportunities for socialisation**

1
2
3 Staff identified visitors as a facilitator to communication interaction for stroke patients
4 outside of therapy times during their inpatient admission.

5
6 Interaction with the family... it's not therapy based but it's their [stroke patients']
7 opportunity to practice. (PT1)

10 **Volunteers facilitate opportunities for patients to engage in social activities**

11 Staff discussed the benefit of volunteers in facilitating opportunities for patients to engage
12 in social interactions including programs involving therapy dogs, book loaning, hand
13 massages, and taking patients off the ward.

14
15
16 If we see people that are lonely, are not getting visitors, there's many volunteers... to
17 go and visit them and if they're well enough they can take them out... the volunteers,
18 we do rely on them. (OTA)

25 **Staff related factors**

27 **Staff utilisation of resources promote communication exchange**

28 Staff identified access to resources such as chat books and alternative and augmentative
29 communication boards often facilitated communication interactions with stroke patients
30 with communication impairments on the ward.

31
32
33 Sometimes with the ... signs... "do you want to drink? some water?" or something, so
34 they can just point because ... they want to say something and maybe the right
35 words are not coming out... that also helps. (RehabN3)

40 **Speech pathology support and education facilitates staff's use of communication 41 promoting strategies**

42 Staff reported support and education from speech pathology staff facilitated their ability to
43 interact successfully with stroke patients with aphasia.

44
45 I had a patient who had word finding difficulties... I just was observing the speechie
46 [speech pathologist], she would just be like "no, what do you mean?" and he'll be
47 like [pointing] and she'll be like "tell me what's the word"... it's something I could
48 have just added to my session. (PT4)

54 **Staff knowledge and utilisation of communication strategies promotes communication 55 activities**

1
2
3 Staff and volunteers discussed the use of communication strategies and resources to
4 facilitate communication on the ward for patients with a variety of communication
5 impairments.
6
7

8 We use communication boards, pictures, writing things down, talking slowly.

9
10 (MedC2)

11
12 If they are having trouble, I will say to them "it's okay you don't need to hurry, that's
13 fine". (V1)
14
15

16 **Individual staff factors promote communication opportunities for patients**

17 Staff and patients talked about how individual characteristics of staff, including
18 rapport building and being friendly, facilitated communication for patients with
19 communication difficulties.
20
21

22
23 Sometimes they [stroke patients] look for that specific person... the more they get
24 confident, the more they get relaxed, the more their speech enhances as well.

25
26 (RehabN3)
27
28
29
30

31 **Discussion**

32 This study aimed to explore hospital staff, volunteers and stroke patients'
33 perceptions of barriers and facilitators to communication on an acute and a rehabilitation
34 ward. A wide range of factors were perceived to act as potential barriers or facilitators to
35 communication. Additionally, a number of factors influencing patient access to
36 communication opportunities appeared to influence one another.
37
38

39 The co-location of patients in therapy spaces, dining areas or in shared rooms were
40 perceived as facilitators to communication for stroke inpatients providing opportunities for
41 incidental social interactions with other patients and their visitors. However, background
42 noise in these shared spaces was also perceived to act as a barrier to patients' ability to
43 engage in communication. Patient access to communal spaces was influenced by a number
44 of factors including patients' sense of autonomy to freely explore the hospital ward
45 environment, and their medical and mobility status, and staff's perception of their available
46 time, which influenced staff's perception of whether they transferred patients to these
47 spaces. Rosbergen et al¹⁴ reported that in an acute stroke ward enriched environment
48 communal mealtimes and group activities were perceived to facilitate social activity. The
49 study by Rosbergen et al¹⁴ found that staff reported perceptions that shared rooms limited
50
51
52
53
54
55
56
57
58
59
60

1
2
3 staff and patients' ability to engage in private conversations, consistent with O'Halloran et
4 al's¹⁵ findings. It may be that access to both private and communal spaces available within
5 the hospital environment play critical roles in regards to providing opportunities for social
6 interactions with other patients and their visitors and opportunities for privacy when
7 required.
8
9

10
11
12 The predominance of single rooms and limited opportunities to access shared spaces
13 may have increased the effect of other barriers on communication opportunities for
14 patients. For example, a patient with poor autonomy may be more likely to remain alone in
15 their single room when they are not attending therapy, as they perceive they are not
16 'allowed' to freely explore the hospital environment. This may reduce the likelihood of the
17 individual independently seeking out social interactions beyond their room. If they also have
18 reduced mobility, they may be more reliant on staff to facilitate transfers to communal
19 spaces which may be impacted by staff time constraints. The person's functional status may
20 also limit their ability to initiate and engage in activities while they are in their room.
21 Therefore, the combined effect of these barriers may significantly limit this patient's
22 communication opportunities.
23
24
25
26
27
28
29
30
31

32
33 These communication barriers may be mitigated by having regular visitors to provide
34 opportunities for communication and socialisation within their room, and facilitate patient
35 access to shared spaces, such as helping mobilise wheelchair bound patients into communal
36 dining areas or education to patients that they are allowed to explore the hospital ward
37 environment. Rosbergen et al¹⁴ identified patient and family autonomy to initiate and direct
38 activity as a factor enriching the acute ward environment. Therefore, increasing patient
39 autonomy within this setting may facilitate their ability to seek out interactions within the
40 environment and increase engagement in communication activity, which may then reduce
41 the effect of being in a single room with reduced mobility and time poor staff.
42
43
44
45
46
47
48

49 A potential lack of opportunities to access social interactions with other patients
50 means staff, including volunteers, and visitors may become the main communication
51 partner for stroke inpatients. Godecke et al's³ observation study found that nurses are the
52 most frequent communication partner for patients with aphasia, after their family
53 members, therefore patient-staff interactions may play a significant role for those patients
54 with minimal or no visitors. Within the current study, communication between staff and
55 patients appeared to be dependent on a number of factors including staff perception of
56
57
58
59
60

1
2
3 their role, their knowledge and skills in facilitating communication, their values and
4 attitudes towards communication and whether supporting language and communication for
5 stroke patients with aphasia is part of their 'role', their willingness to be flexible with their
6 time, and their knowledge of and access to resources which may be used to facilitate
7 communication. This also highlights the potential impact of the perceived power imbalance
8 between staff and patients and the significance of interactions that are task directed. Hersh
9 et al¹⁶ reported stroke patients with aphasia felt disempowered in communicative
10 interactions with nurses, where nurses tended to talk to the task and controlled the
11 interactions. This highlights the need for communication partner training which may provide
12 staff with the knowledge and skills required to support effective communication with
13 patients with aphasia.¹⁷

Time pressure was perceived as a major barrier to communication impacting on staff's ability to support successful communication within their interactions with patients, and facilitate patients' opportunities to engage in interactions in social or communal areas. Time constraints have been reported to limit communicative opportunities between stroke in-patients and nurses.¹⁸ Ball et al¹⁸ found that 86% of surveyed nurses reported one or more activities had been "left undone" in their last shift as a result of lack of time. The study found that activities most likely to be missed by nurses as a result of time constraints were comforting and talking to patients (66%) and patient education (52%).¹⁸ This has also been identified by patients who "did not like to bother the busy nurse".¹⁹ Time limitations and pressures on the wards may be facilitated by developing staff knowledge of and skills in using communication promoting strategies. Effective and efficient nurse patient communication as a result of nurse training has been found to save time, reduce frustration and reduce the burden associated with caring for PWA.²⁰

This study included a small number of medical and nursing staff in comparison to compared to allied health staff which may be reflected in the reported results. This study also involved a small number of stroke participants and a broader range of perspectives may have been expressed with a larger number of participants. The results of this study may reflect the context of a private metropolitan hospital therefore further exploration of stroke patient and staff perspectives in the public sector may be warranted.

Conclusions

1
2
3 The barriers and facilitators to communication appear to be interconnected and
4 likely to influence one another, suggesting that the level of communication access may vary
5 from patient to patient within the same setting. The identification of factors that support
6 inpatient communication may reduce the risk of stroke patients with aphasia and other
7 communication impairments developing maladaptive communication behaviours such as
8 learned non-use of communication. A CEE has the potential to benefit stroke patients with
9 and without communication impairments by increasing communication access, improving
10 patient well-being, promoting overall engagement in stroke rehabilitation and improving
11 post-stroke recovery.

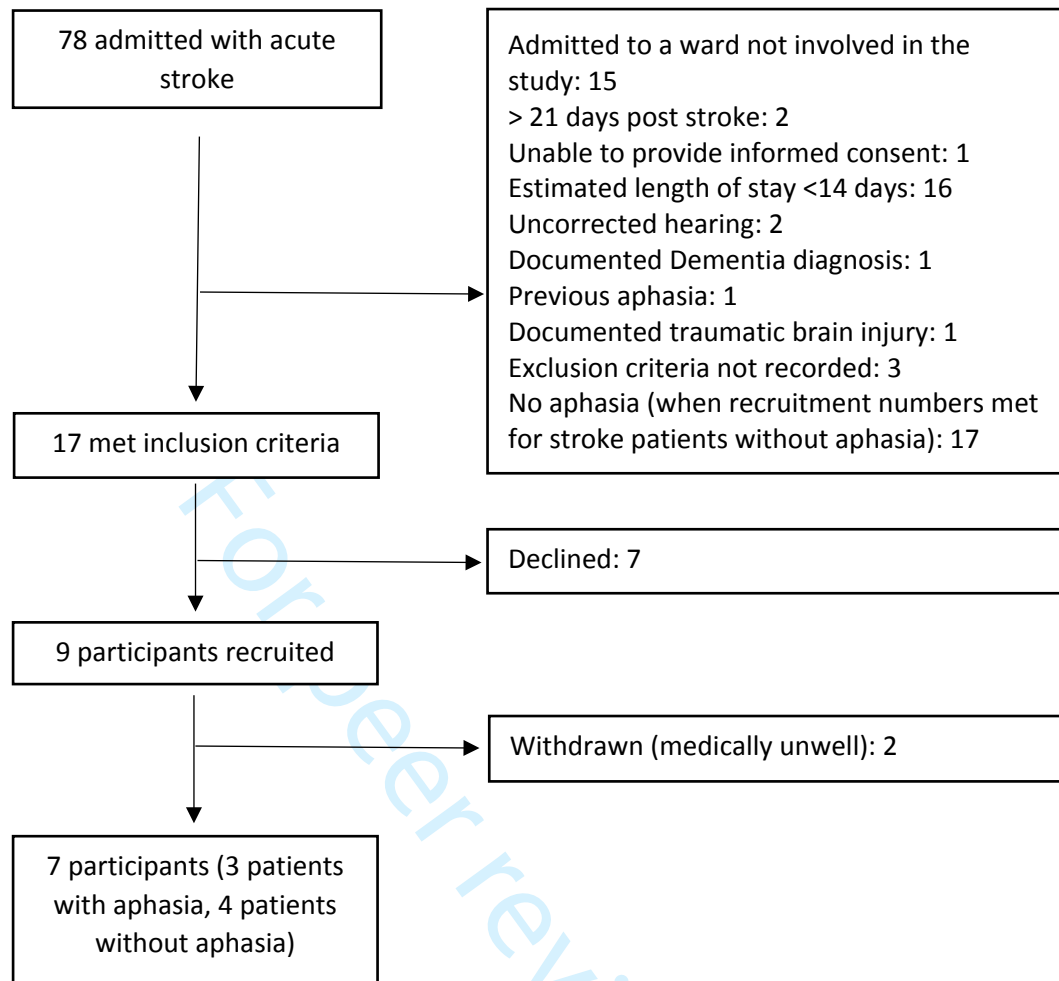

Figure 1. Summary of stroke participant screening and recruitment

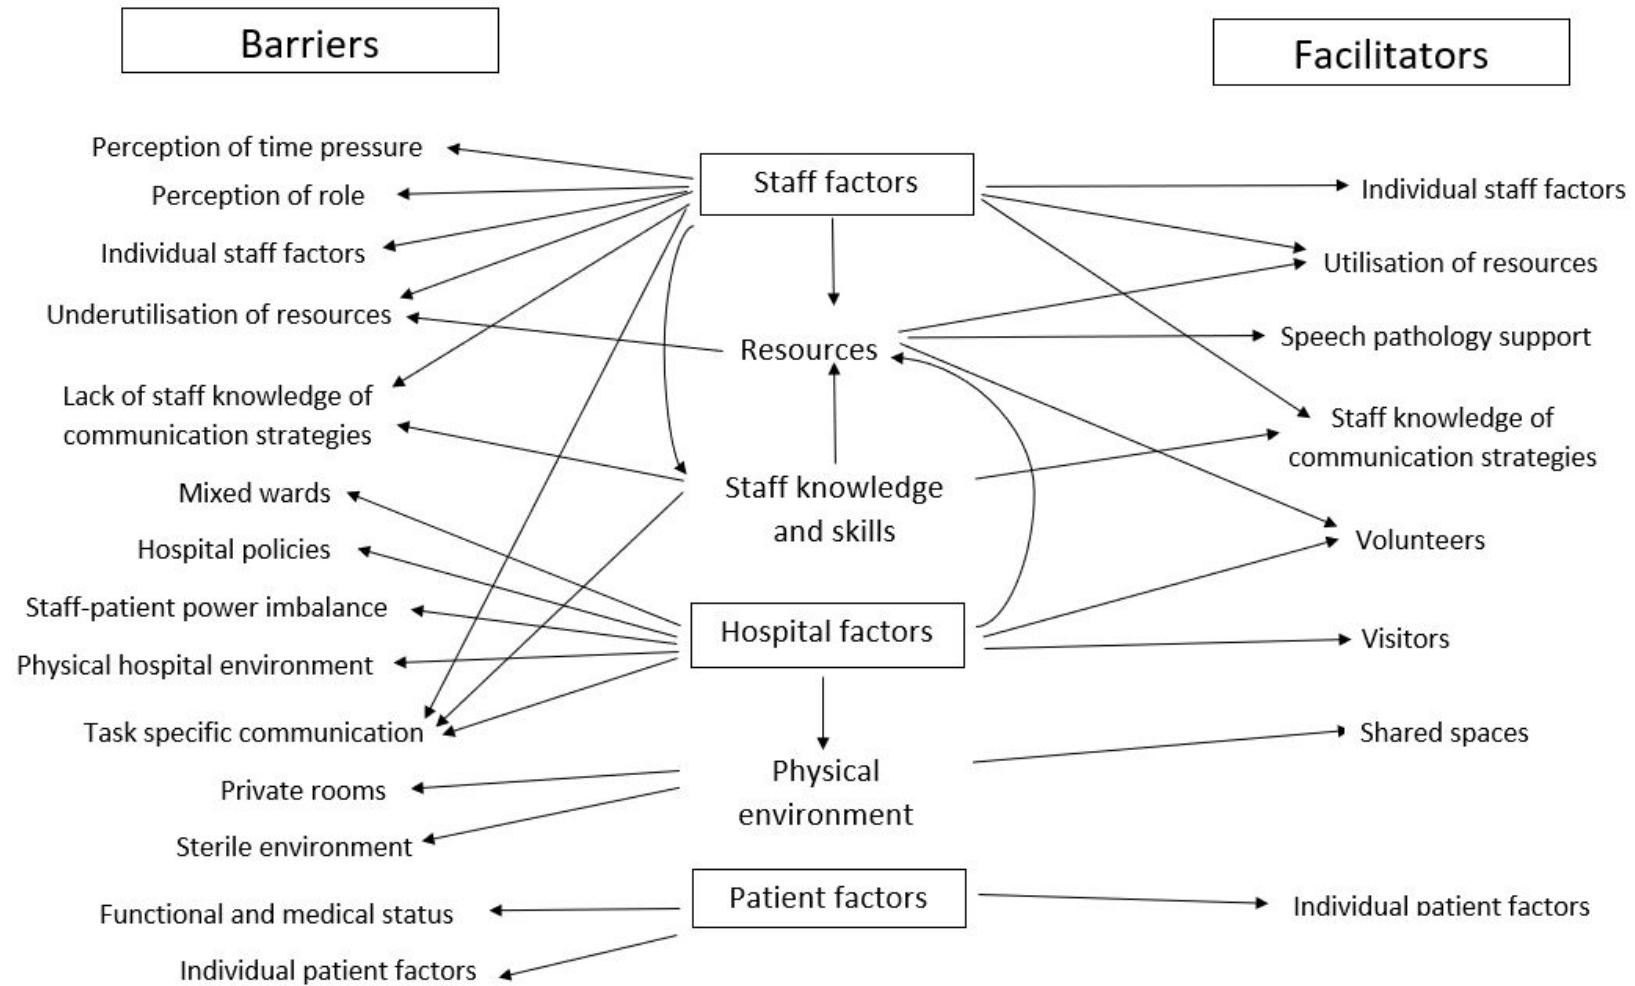

Figure 2. Summary of themes and subthemes of staff and patient perceptions to barriers and facilitators to stroke inpatient communication and language activities.

Appendix A.**Investigating Communication Enhanced Environments after stroke: Staff focus group guide**

What kind of language activities or language tasks do stroke patients currently participate in on the ward?

What kind of language activities or language tasks would you like see stroke patients have access to on the wards?

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about anything that facilitates your ability to communicate with stroke patients on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

What changes would you like to see to enhance communication between staff and stroke patients on the ward?

What changes would you like to see to enhance communication between visitors and stroke patients on the ward?

How could we enhance or optimise communication and language tasks and activities for stroke patients on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

Appendix B.**Investigating Communication Enhanced Environments after stroke: Patient interview guide**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

Investigating Communication Enhanced Environments (CEE) early after stroke: A before-after non-randomised**controlled pilot study.****Study protocol version 1 19.05.20****Edith Cowan University****Chief Investigator**

1 Abbreviations and Definitions of Terms

CEE: Communication Enhanced Environment, an adapted model of an Enriched Environment, an environment that provides stroke patients opportunities to engage in language activities during inpatient rehabilitation.

PWA: Stroke patients with aphasia.

PWOA: Stroke patients without aphasia.

Language activities: Language tasks that consist of solitary or interactive language activities.

Solitary language activities: Activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications.

Interactive language activities: activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

EE: Enriched Environment, an environment that promotes physical, cognitive and social activity.

For peer review only

2. Protocol Synopsis

<p>Study Title:</p>	<p>Investigating Communication Enhanced Environments on acute and rehabilitation wards early after stroke: A before-after non-randomised controlled pilot study</p>
<p>Study type:</p>	<p>Interventional</p>
<p>Study Intervention:</p>	<p>A Communication Enhanced Environment (CEE) model will be developed from pre-intervention observations of inpatient language activities and investigations of barriers and facilitators to communication together through focus groups with hospital staff and interviews with patients on the acute and rehabilitation wards.</p> <p>Sixteen stroke patients will be recruited in this prospective before-after non-randomised controlled pilot study set in an acute and a rehabilitation ward of a metropolitan private hospital. The study includes: i) The baseline phase which involves observation of stroke patients (n=8, 4 stroke patients with aphasia (PWA) and 4 stroke patients without aphasia (PWOA)); the collection of qualitative data through focus groups and semi-structured interviews to determine patient and staff perceived barriers and facilitators to communication; ii) the implementation phase where a model of CEE will be developed and embedded into usual care; iii) the post-implementation phase which will involve repeated baseline data collection on a different cohort of patients (n=8, 4 PWA and 4 PWOA) to determine i) how solitary and interactive language activity levels changed following implementation of the CEE model, ii) the differences post CEE implementation in hospital staff's use of communication promoting strategies when interacting with stroke patients, iii) the differences post CEE implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>The CEE model will include the provision of:</p> <p>i) CEE equipment, for example reading materials such as books and magazines, and access and encouragement to reside in a communal dining area;</p> <p>ii) CEE education, support and training for staff with the aim to develop the ability to facilitate language activities for patients after stroke. The training program will be guided by research evidence, expert opinion and baseline data. Staff will complete a questionnaire pre and post training to determine changes in their knowledge, skills and attitudes regarding communication and aphasia.</p> <p>Control treatment: Stroke patients with and without aphasia will be observed and video recorded over two week days and one weekend day pre (n=8) and post (n=8) implementation of a CEE model. Behavioural mapping will record patient interactive and solitary language activity observed within the first minute of 5-minute intervals in 4-hour time periods between 7am and 7pm. <i>Solitary language activities</i> are activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications. <i>Interactive language activities</i> are activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.</p>

<p>Objectives of the Study:</p>	<p>This study aims to investigate a CEE on an acute and rehabilitation ward and if stakeholders perceive a CEE within the rehabilitation stroke unit as valuable by addressing the following research questions:</p> <ul style="list-style-type: none"> - Does a CEE increase the amount of time PWA and PWOA spend in participating in solitary and interactive language activities on acute and rehabilitation wards during the early post-stroke period? - What are the differences in stroke patients' experience of communication in a CEE compared to stroke patients' experience of communication in a standard environment on in-patient acute and rehabilitation wards? - What is the experience of implementing a CEE for staff working with PWA and PWOA within in-patient acute and rehabilitation wards? - Do staffs' perceptions of their knowledge of, skills with, and attitude towards communication and aphasia change following implementation of a CEE?
<p>Number of Centres:</p>	<p>1</p>
<p>Study duration:</p>	<p>5 years</p>
<p>Study Hypothesis:</p>	<p>A CEE will increase stroke patient solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.</p>
<p>Primary outcomes:</p>	<p>The primary outcome is the change in the proportion of solitary and interactive language activities as a percentage of total observed activity after the implementation of the CEE model.</p> <p>Timepoint: Stroke patient observations completed within 21 days post stroke.</p>
<p>Secondary outcomes:</p>	<p>The differences post CEE implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>Timepoint: Within 18 months of embedding the CEE model.</p>
<p>Study design:</p>	<p>T1-T2 before-after non-randomised pilot study</p>
<p>Key inclusion criteria:</p>	<p>Stroke patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a stroke, less than 21 days post stroke during baseline phase or post-implementation phase, the ability to provide informed consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening, an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below 93.7 on the Western Aphasia Battery-Revised.²</p> <p>Staff participants: One representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.</p>
<p>Key exclusion criteria:</p>	<p>Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at the time of acute admission or are a participant in another research trial which may affect this study's outcome measures.</p>
<p>Study Procedures:</p>	<p>Baseline phase: Eligible stroke participants during the baseline phase will be observed and video recorded for 4 hours on 3 consecutive days (one weekend and two weekdays) and will complete a semi-structured interview to explore their experiences of communication, and their</p>

	<p>perceptions of barriers and facilitators to inpatient language activities during their inpatient admission.</p> <p>Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to inpatient language activities. A focus group interview schedule will be used across all focus groups.</p> <p>Implementation phase: The CEE model will be implemented within the acute and rehabilitation wards.</p> <p>Post-implementation phase: Intervention group patient observations and interviews, and staff focus groups will replicate baseline data collection.</p>
Safety parameters	<p>Stroke participants and/or their significant others may experience increased levels of distress during recruitment and/or data collection. This may be the result of adjustment following stroke and/or diagnosis of aphasia and increased awareness of impairment. No other risks known regarding participation in this project. The baseline assessments and interview will be conducted by the Chief Investigator who has experience in supporting stroke patients during this early stage of stroke recovery. If a stroke participant or significant others becomes upset or distressed, the assessment or interview will be paused with the option to discontinue and counselling strategies will be provided.</p>
Statistical methods /analysis	<p>Patient demographic and stroke characteristics will be presented using descriptive statistics. One-way ANOVA or the Kruskal-Wallis and chi-square tests will examine differences in characteristics between groups. Time spent observed in interactive and solitary language activities will be expressed as a percentage of total observations. A mixed design ANOVA will be used to calculate the within-subjects variable of presence of aphasia and the between-subjects variable of a CEE on language activity levels of participants by comparing baseline to intervention phase observations. A qualitative description research approach will be used for the qualitative component of this research. The mixed methods design will enable the triangulation of the qualitative and quantitative data.</p>
Sample size determination:	<p>The stroke participant sample size was selected for this pilot study to collect data across each observation period for each patient group in the baseline and intervention phases (see document: Observation_protocol_SD_version 3_23-02-16). The sample size for staff participants was selected to capture a sufficient breadth of professional perspectives.</p>

3. Introduction

Aphasia is an acquired communication disorder that affects approximately 30% of first ever ischaemic stroke survivors³ and persists in up to 61% of survivors one-year post stroke.⁴ Aphasia impacts all communication modalities with significant negative consequences for social participation, interpersonal relationships, autonomy, capacity to work and quality of life.⁵

Stroke patients with aphasia (PWA) have been observed to spend less than 28% of their day communicating and 44% of their day alone during their first weeks of inpatient rehabilitation.⁶ Inadequate opportunities for communication places PWA at risk of developing maladaptive behaviours such as learned non-use of language.⁷

Environmental Enrichment (EE) refers to conditions which promote physical, cognitive and social activity and has been shown in animal models of stroke to enhance neuroplasticity⁸, promote better learning and memory and contribute to significant improvements in motor function.⁹ The human equivalent model¹⁰ in a rehabilitation unit results in stroke patients spending more time engaged in activity and less time sleeping and alone.¹¹

4. Objectives

Aphasia is a complex language impairment and PWA may need additional support within an Enriched Environment. This pilot study seeks to develop and test an adapted model of an Enriched Environment, a Communication Enhanced Environment (CEE), as a strategy to provide PWA and stroke patients without aphasia (PWOA) more opportunities to engage in language activities during inpatient rehabilitation. Within this study language activities include both *solitary activities* that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications, and *interactive activities* which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

4.1 Hypotheses

A CEE will increase stroke patient solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.

5. Study design

This mixed methods pilot study is a prospective before-after non-randomised controlled design in an acute and a rehabilitation ward of a metropolitan private hospital. The study involves three phases:

- i) *Baseline*: observe and quantify the current ward environment;
- ii) *Implementation* of the CEE model;
- iii) *Post-implementation*: assess the impact of the CEE model.

6. Study Population

- i) *Stroke patients*: The baseline group (n=8, 4 PWA, 4 PWOA) recruited within the baseline phase, and the intervention group (n=8, 4 PWA, 4 PWOA) recruited during the post-implementation phase.
- ii) *Staff participants*: One representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.

6.1 inclusion and exclusion criteria

Stroke patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a stroke, less than 21 days post stroke during baseline phase or intervention phase, the ability to provide informed consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening, an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below 93.7 on the Western Aphasia Battery-Revised.²

Stroke patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at the time of acute admission or are a participant in another research trial which may affect any of this study's outcome measures.

Staff and volunteers who are over 18 years old will be eligible to participate in this study.

7. Study Assessments and Procedures

Baseline

All recruited stroke participants will complete the Montreal Cognitive Assessment,¹¹ and The NIH Stroke Scale.¹² PWA will also complete the Western Aphasia Battery-Revised.² Stroke participants' behaviour will be observed and video recorded for four hours per day on a Sunday, Monday and Tuesday between 7am to 7pm. A behaviour mapping tool (Appendix A) developed for this study will record stroke participant engagement in language activities in the first minute of each five-minute interval across each four-hour observation period. Semi-structured interviews will explore stroke participants' perceptions of barriers and facilitators to inpatient language activities. An interview schedule will be used across all interviews (Appendix B.). Supportive communication strategies will be used to facilitate PWA participation in interviews with transcriptions annotated to capture any non-verbal responses.

Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to inpatient language activities. A focus group/interview schedule (Appendix C.) will be used across all focus groups.

Implementation

The CEE model will be implemented within the acute and rehabilitation wards.

Post implementation

Intervention group patient observations and interviews, and staff focus groups will replicate baseline data collection.

8. Study Treatment

The CEE model incorporates the following strategies to encourage engagement in language activities:

- i) Staff training to facilitate stroke patients' communication and provide opportunities to engage in language activities;
- ii) Patient access to:
 - a) Communication enhancement resources such as iPads and audiobooks;
 - b) Communal areas to facilitate engagement amongst patients.

9. Participant Completion and Discontinuation

9.1 Participant Completion

Participants will have completed the study when they have completed the semi-structured interview.

9.2 Participant withdrawal

Participation in this study is voluntary. The participant can withdraw from taking part in the study at any time without giving a reason for withdrawing.

10. Data analysis

10.1 Primary Analysis

The proportion of observed episodes where PWA and PWOA are engaged in language activities at baseline and post implementation will be analysed using a mixed design ANOVA.

10.2 Secondary Analysis

The differences in staff and patient perceptions of the barriers and facilitators to inpatient language activities and communication post CEE implementation will be analysed through a qualitative description approach. Triangulation of the qualitative and quantitative data will be conducted.

11. Data management

The data collected will be confidential. No identifying information will be attached to the data and any information that may reveal participant's identity will be removed. The master list of participant names and codes will be kept in a locked filing cabinet at the hospital site which will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The de-identified data will be stored on a password-controlled computer and/or in a locked cabinet at Edith Cowan University. Electronic data will be backed up on a password controlled hard drive only accessible by the Chief Investigator.

The data collected from this study will have a significant contribution to the aphasia research area and therefore will be stored for 15 years following the completion of this study. Data may be accessed for future studies by the study investigators or higher degrees by research (HDR). In the case of HDR use of the data, the use of the data will be bound by a two-way confidentiality agreement. The data may be used for teaching purposes only with the additional written permission from participants. The data may be made accessible to consumer groups (for example the Australian Aphasia Association) and information may be made available through the National Stroke Foundation and scientific journals. Confidentiality will be maintained in all circumstances. Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data are only used for approved purposes. Researchers who access this data from the data bank will not have access to the participant keys that attach participants to codes therefore data will only be re-identifiable by the Chief Investigator. Data will be deleted from electronic storage and hard copy data will be shredded by the chief investigator after 15 years completion of the research study (with Ethics Committee approval, Ethics approval numbers: HPH431 and ECU HREC 12149). Non-identifiable data will be added to data archives for data sharing. Researchers who access data archives will not have access to information attaching participants to coded data.

12. Study Report

This study will be published in a PhD thesis as part of the Chief Investigator's Higher Research Degree. Outcomes from this study will be published in peer review journals and at conferences.

13. Administration Procedures

13.1 Ethical Considerations

This research is likely to have a significant impact on aphasia recovery following stroke and will form the basis for future study designs. This study will develop a teaching and learning package that can be used in the future to facilitate and promote increased levels of communication activity during early stroke recovery. The implementation of a CEE may address missed opportunities for language stimulation, harness increased levels of neuroplasticity and optimise aphasia language recovery after stroke. The benefit of a CEE may extend beyond patients with aphasia and may improve health care experience and communication access for all stroke in-patients. Additionally, these benefits may extend beyond patients involved in the study as trained staff may use skills and knowledge obtained in the training program to enhance the communication environment of all patients they care for.

13.2 Ethical Review Committee

All processes and documentation used within this study will be reviewed and approved by the Edith Cowan University Research Ethics Committee and the site Ethics Committee. The Chief Investigator will complete the annual ethics reports and will be responsible for reporting any adverse events to the Ethics Committees.

13.3 Informed Consent

Participants will be excluded if they do not have adequate English proficiency to participate in semi-structured interviews and focus groups. Any participants that require an interpreter will be excluded from inclusion in this study as determined by the medical team.

Patients with aphasia will be provided with aphasia friendly information sheets and consent forms with simple language, bold key words and pictorial support. This will be read and explained by the researcher. Supported conversation strategies will be used to support and facilitate patients with aphasia's involvement and understanding of the research process, informed consent and their rights to withdraw at any time. This will be provided by the Chief Investigator who is a qualified speech pathologist with experience in communicating with patients with aphasia using supported conversation techniques to facilitate and support communication. A detailed information will also be provided to the 'person responsible' for all stroke patients.

13.4 Protocol Amendments

All protocol amendments will be reviewed and accepted by the Edith Cowan University Research Ethics Committee and the site research Ethics Committee.

Communication Enhanced Environments after Stroke**Study procedure version 2_23-02-16****BASELINE:**

Staff recruitment: The Chief Investigator will recruit staff participants through a verbal explanation of the study and the provision of the information sheets and written consent forms. Staff will be provided 48 hours to discuss the study and ask questions before consenting to participate. Staff interviews and focus groups will commence as staff participants are recruited. Staff will participate in a one-hour focus group or a one-hour semi-structured interview (in person or via telephone) to explore staff perceptions of environmental barriers and facilitators to language activity and communication on in-patient acute and rehabilitation wards.

Patient recruitment: All consecutively admitted stroke patients during the baseline period will be screened for eligibility to participate in the study. The hospital site investigators will identify potential stroke participants that meet the inclusion and exclusion criteria. Stroke participants with aphasia will be identified by the hospital speech pathology or medical team as having a diagnosis of aphasia (aphasia diagnosis will be confirmed via Western Aphasia Battery-Revised (WAB-R)¹ Aphasia Quotient score <93.7 during data collection). The site investigators will approach potential participants and gain verbal consent from the patient to be approached by a member of the research team and have their 3-point identification released to the research team. This will be documented in the patient's integrated medical progress notes. Once verbal consent has been gained and documented, the site investigators will email the Chief Investigator the patient alert proforma identifying the patient as meeting the inclusion/exclusion criteria. The research team will liaise with the medical team to confirm the potential stroke participant meets the inclusion criteria: (i) admitted to the in-patient rehabilitation stroke unit for recent stroke, (ii) are less than 21 days post stroke and during baseline phase or intervention phase, (iii) have the ability to provide informed consent as determined by the medical team iv) Glasgow Coma Scale² greater than 10 at the time of screening, (v) have an estimated length of stay greater than 14 days and (vi) have adequate English proficiency to participate in semi-structured interviews. Patients will be excluded if they (i) have uncorrected hearing or vision (for example hearing impairment without hearing aids, vision impairment without glasses), (ii) are not medically stable, (iii) have a documented diagnosis of major depression or (iv) have a documented history of dementia or significant cognitive decline, traumatic brain injury or previous aphasia at the time of admission for the acute event, (v) or are a participant in a research study that will influence this study's outcomes. Stroke participant recruitment will follow the stroke participant consent procedure (see document: SD_Communication Enhanced Environments after Stroke consent procedure version 1_3-2-15). A record of identifying participant details attached to patient codes will be kept at the hospital site in a locked filing cabinet. An email summary of the baseline assessment results will be sent to the hospital speech pathology generic email address. The patient will be identified by patient code and ward/room number. The hospital speech pathology team will write a summary of the assessment results in the patient's integrated medical progress notes.

Patient data collection: All recruited stroke participants will complete the NIH Stroke Scale³ (by someone trained in using this tool) and the Montreal Cognitive Assessment (MoCA).⁴ Participants with aphasia will also complete an assessment of aphasia, the WAB-R¹ and provide a personal narrative language sample on their reason for admission to confirm a diagnosis of aphasia. After patient recruitment has been completed, the Chief Investigator and/or trained medical team members will recruit the patient's family, friends and significant others to consent to video recording and observations of their interactions with stroke participants.

Observations of stroke participants will commence 1-3 days after obtaining written consent. Patients' behaviour will be observed by the Chief Investigator or a Research Assistant, and video recorded for a total of 12 hours to enable behaviour mapping of video data (see document: Observation_protocol_SD_version 3_23-02-16). Patients will be observed and video recorded for 4 hours per day on weekend day and two consecutive weekdays between 7am to 7pm. The observation periods will be grouped into 4-hour observation intervals (e.g. 7am-11am, 11am-3pm and 3pm-7pm). Each day the patient will be observed and video recorded for one observation interval. The participant will be observed and video recorded during a different observation interval each day to gain a general insight into the patients' activities (see Figure 1. below). Patients who do not consent to video recording will be provided with the option of audio recording and manual observation conducted by the researcher to enable the collection of case notes regarding patient behaviour. An observational protocol developed for this study will be used to measure the frequency stroke participants engage in language activities. These will be categorised into *solitary language activities* for example reading, writing, listening to the radio, use of iPad applications, and *interactive language activities* defined as i) an interaction involving an exchange of information, ii) with a communication partner including gesture and/or facial expression, reading, writing or drawing for the purpose of communication and use of technology including talking on the telephone. The observational protocol will be based on the behavioural mapping techniques of Janssen et al.⁵ Stroke patients' solitary and interactive language activities will be recorded in 5-minute intervals and activity observed within the first minute of the observation interval will be recorded on a checklist of the predetermined behaviours. Semi-structured supported conversation interviews for stroke participants will be conducted within 5 days of the last observation. The interviews will explore stroke patients' perceptions of environmental barriers and facilitators to language activities and communication and their experience of communication on the acute and rehabilitation wards.

IMPLEMENTATION:

A model of a CEE will be implemented within the acute and rehabilitation wards. The model will be developed as part of the research project. We hypothesise that our model of CEE will include the provision of:

- i) CEE equipment, for example reading materials such as books and magazines, access to a computer with internet and access to a communal dining area,
- ii) CEE education, support and training for staff, patients and their family, friends and significant others with the aim to develop the ability to support and facilitate 'language activity' and 'communication activity' for patients after stroke. This will be accessible via multiple modalities including one-on-one training and group training sessions, as

well as through the provision of video and written resources. A questionnaire will be administered pre and post training in order to determine staffs' perceptions of changes in their knowledge, skills and attitude towards communication and aphasia. Additionally, feedback regarding the content and format of the training program will be obtained through questionnaires administered after the completion of the training program. Training and support provided in the implementation phase will be continued until the end of the intervention phase.

POST-IMPLEMENTATION:

Staff participant semi-structured interviews and focus groups will be conducted. Staff will participate in a one-hour semi-structured interview or a one-hour focus group to explore staff perceptions of environmental barriers and facilitators to language activities and communication.

The procedures for participant recruitment and data collection during the post-implementation phase will replicate those used in the baseline phase.

There is no travel commitment for all participants as all data collection and training will be conducted at the hospital.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday

Communication Enhanced Environments after Stroke consent procedure

Version 1_3-2-15

Stroke participants

The following consenting procedure will be used for all participants who are identified as potential research participants. Recruitment will only be completed by the Chief Investigator.

1. Check the stroke participant meets the inclusion criteria and exclusion criteria.
2. Read the participant information sheet to the participant. Use the pictures on the participant consent form to support the patient's comprehension of verbal information. Use gesture, written and pictorial support to facilitate verbal communication as required.
3. Provide the person responsible with the person responsible information sheet and consent form.
4. Provide time for the stroke patient and the person responsible to discuss the study and ask questions to their satisfaction.
5. Ask the stroke participant if they consent to the study using simple closed questions (e.g. "Do you understand what the study is about?", "Do you have any questions about the study?", "Do you want to be in the study?", "Will you sign the form?"). Use multi-modal communication strategies and repeat information/questions as required. Use the pictures on the participant consent form to support patient comprehension of verbal information.
6. If the stroke patient agrees to participate in the study, ensure they sign the consent form witnessed by someone independent of the study.
7. Provide the stroke participant with a copy of the information sheet and consent form for their own records.
8. Add the participant study number to the consent form
9. Store the signed consent forms in a locked cabinet at the hospital site. This cabinet will only be accessible by the research investigators.

Investigating Communication Enhanced Environments after stroke

Observation Protocol version 3_23-2-16

During the baseline and intervention period, patients' behaviour will be observed and video recorded for a total of 12 hours. Patients who do not consent to video recording will be provided with the option of audio recording and manual observation. This will enable the collection of relevant notes about factors that might influence the interactions that may not be captured in the video or behavioural mapping, for example the context of the interactions or details about the environment.

Patients will be manually observed and video recorded for four hours per day on two weekdays and one weekend day between 7am to 7pm. The observations will be grouped into three x 4-hour observation intervals (e.g. 7am-11am, 11am-3pm, 3pm-7pm). Each day the patient will be observed and video recorded for one of the 4-hour observation intervals. The 4-hour observation period will be split into 5-minute intervals. All language and communication activity observed within the first minute of the 5-minute interval will be recorded on the behavioural mapping sheet with predetermined behaviours (Appendix 1). The free smart phone app 'Impetus' can be used to time 1-minute observations. You can set the timer to vibrate briefly when the 1-minute observation interval begins and ends.

Observation times (see Figure 1.) will be randomly selected by drawing out of an envelope. This will be conducted by the primary investigator prior to commencing patient observations. It may not be possible to observe the patient during the planned observation time, for example as a result of scheduled testing or home visits. If this occurs, patients can be observed during the next available observation interval. Changing or modifying the observation schedule should be avoided where possible.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday
1	7am-8am	*PWA1	PWA3	PWA2
	8am-9am	**PWOA1	PWOA3	PWOA2
	9am-10am			
	10am-11am			
2	11am-12pm	PWA2	PWA1	PWA3
	12pm-1pm	PWOA2	PWOA1	PWOA3
	1pm-2pm			
	2pm-3pm			
3	3pm-4pm	PWA3	PWA2	PWA1
	4pm-5pm	PWOA3	PWOA2	PWOA1
	5pm-6pm			
	6pm-7pm			

Figure 1. Observation schedule

*PWA: stroke patient with aphasia

**PWOA: stroke patient without aphasia

DISCOURSE SAMPLE

You must collect a personal narrative discourse sample for each participant at the beginning of the first observation. Once you have set up the video camera and have started recording, ask the patient “what has brought you into hospital?”. Once the patient has finished telling you their personal narrative, tell the patient you will now start the observations.

VIDEO RECORDING SET-UP

Place the video camera facing the patient approximately 1-2 metres away from them. Ensure the camera is placed in an area where it is unlikely to be moved for the duration of the observation time (for example at the end of the patient’s bed). Ensure the camera frame is capturing the patient as well as their surroundings (e.g. potential communication partners, visitors, etc). If the patient relocates, reposition the camera to ensure the patient and their surroundings remain in frame. Observe and manually record the patient’s behaviour and their environment according to the procedure for behavioural mapping.

Do not record the patient in the bathroom or shower or during any other inappropriate circumstances (this may include sensitive conversations, culturally sensitive situations or if the patient requests). If the patient indicates that they don’t want to be recorded or becomes agitated, upset or distressed, use the ‘withdrawal from observations visual resource’ (if appropriate) and ask the patient:

1. Do they want you to stop video recording?
2. Do they want to be manually observed and audio recorded instead?
If the patient responds ‘no’, ask the patient-
3. Can you come back another time to observe them?

If the patient asks you to stop recording you must cease recording immediately. The patient may allow you to continue with manual observations or come back another time to complete the observations. If the patient allows you to complete manual observations and audio recording, follow the audio-recording set-up and protocol below.

AUDIO RECORDING SET-UP AND PROTOCOL

This protocol is to be followed if the patient or their family indicate they do not want to be video recorded however agree to audio recording and manual observations. Place the cap on the video camera and continue recording in order to capture audio. If using a battery-operated audio recorder, place it on a table close to the patient (within 1

1 metre). Ensure the audio recorder is placed in a location where it will not be touched or moved throughout the
2 observation time. Observe and manually record the patient's behaviour and their environment according to the
3 procedure for behavioural mapping. Ensure spare batteries for the audio recorder are available if required.
4
5
6
7

8 **COMMUNICATION PARTNERS AND VISITORS**

9
10 Take note of all communication partners and visitors who have provided consent to video recording and/or
11 observations of their patient interactions. If someone enters the room during recording politely interrupt the
12 interaction, introduce yourself and inform the person that the patient is being video recorder recorded as a part of
13 the study the patient has agreed to participate in. Ask the visitor if they would like to go out of the room with the
14 researcher to find out about the study and the video recording. Provide a verbal explanation of the study and
15 provide the 'Visitors/communication partners' information and consent form'. Offer the visitor the option of no
16 video or manual recoding during their interaction with the patient. If the person chooses not to participate in
17 manual or video observations inform the person that any incidental recordings of them will be deleted and will not
18 be included in the study. The researcher will step out of the room for the duration of their visit.
19
20
21
22
23
24
25
26
27

28 **PROCEDURE FOR BEHAVIOURAL MAPPING**

- 29 • Position self where the patient can be clearly observed
- 30 • Remain inconspicuous as possible
- 31 • Circle ALL appropriate components on the observation schedule in regards to location, activity, people
32 present and details of language and communication observed within the first minute of each five-minute
33 interval.
- 34 • You can circle more than one key per section if required (except for location).
- 35 • If you require a toilet break, leave the camera recording while you take a break. If you miss a 1-minute
36 observation, place a line through the observation interval on the behavioural mapping sheet and write
37 'unobserved-toilet break'.
38
39
40
41
42
43
44
45
46
47

48 **TIME**

- 49 • Write the time at the beginning of the 1-minute observation interval

52 **LOCATION**

- 53 • Circle only one location
- 54 • If the patient is moving between two locations, circle the location the patient is moving towards

55 AMENITIES: Toilet, shower.

56 BEDROOM: Around the patient's room or bed. If the patient is outside of their doorway this is considered 'hall'.
57
58
59
60

1 HALL: Any hallway within the hospital ward.

2 THERAPY AREA: In an allied health therapy session, including occupational therapy, physiotherapy, speech
3 pathology, nursing.

4 FAMILY MEETING ROOM: Family meeting room.

5 DOCTOR'S ROOM: Doctor's office.

6 DINING ROOM: Dining room during meal times or any other time.

7 COMMUNAL AREA: Communal dining area.

8 OUTSIDE: Outside areas including the garden, car park.

9 OFF UNIT: Off-site locations, home visits, testing off site.

10 OTHER: Anything that doesn't fit into the above categories-provide description of location.

11 PEOPLE PRESENT

12 People present include any person that is near the patient and is able to have an interaction with the patient. If you
13 do not know how to classify the person make a note to check with staff at a later time and complete the observation
14 schedule.

15 **Exceptions:** People who are near the patient but are unable to interact with the patient, e.g. cognitive or behavioural
16 issues, barriers between person and the patient preventing them from interacting- e.g. curtain drawn, people in the
17 way. If an interaction is occurring despite objects in the way, the communication partner is considered as a 'person
18 present'.

19 PEOPLE PRESENT: Nurse, nurse assistant, doctor, physio (physiotherapist), OT (occupational therapist), SP (speech
20 pathologist), DT (dietician), SW (social worker), family/friend, other patient, alone (no-one present that is conducive
21 to interactions), other (describe).

22 ACTIVITIES

23 UNOBSERVED: If you are unable to observe the patient. Place a line through the observation
24 interval and write unobserved.

25 NO LANGUAGE ACTIVITY: If the patient is observed not engaged in any communication activity.

- 26 • Circle 'no activity' on the checklist
- 27 • Write what the patient is doing, e.g. 'sleeping'

28 INTERACTIVE LANGUAGE ACTIVITIES: Defined as an interaction involving an immediate communicative exchange
29 with a communication partner. Interactive language activities may include talking, gesture and/or facial expression,
30 reading, writing or drawing for the purpose of communication, use of communication aids or AAC devices and use of
31 technology including talking on the telephone. Non-verbal gesture or facial expression includes eye contact to
32

1 initiate interactions, hand gestures (e.g. waving, thumbs up), body movements for the purpose of conveying a
2 communicative message (e.g. shrugging) and/or facial expressions for the purpose of communication.

3 Communication aids or AAC devices includes any use of alternative and augmentative devices for the purpose of
4 communication, e.g. high-tech or low-tech AAC devices such as letter boards, pictures/photos, whiteboard, writing
5 or drawing, smart phones, iPad. Please describe communication aids observed.
6
7

8
9 OTHER FUNCTIONAL COMMUNICATION ACTIVITIES: All other communication activities that do not involve a direct
10 immediate communicative exchange with a communication partner. Functional communication activity may include
11 reading, typing/writing, emailing, internet use, watching TV, listening to talking on the radio. Note the patient must
12 be looking directly at the TV to be considered 'watching TV'. If the TV is on in the background, do not include this as
13 'watching TV'.
14
15

16
17 NON-FUNCTIONAL/NON-PROPOSITIONAL LANGUAGE ACTIVITIES: Singing, word games (carried out alone), language
18 apps (used alone), copying written letters, words or sentences (carried out alone).
19
20

21 OTHER: Communication or language activities that do not fit the criteria of interactive language activity, 'other'
22 functional communication activities, non-functional/non-propositional language activities or may be a confounding
23 variable (for example, talking to self and talking to the observer). If a patient is talking to themselves, note if this is
24 appropriate (for example, saying 'excuse me' after burping) or inappropriate (for example, an extensive monologue)
25 and describe the context. If the patient's verbal output is inaudible, write this in the space underneath 'talking to
26 self'.
27
28
29
30
31

32 **Note:** If the patient is using a computer, phone, smart device, or iPad where the activity they are engaged in (e.g.
33 texting, emailing, playing a game, etc) cannot be accurately determined, note this in the comments section. After the
34 1-minute observation interval has been completed ask the patient if they mind sharing if what activity they were
35 completing on their device and record this in the relevant section. If the patient does not wish to share this
36 information with you, record this in the 'other' section.
37
38
39
40

41 COMMENTS

42 Describe the context of the interactions or details about the environment in the comments section. This will provide
43 information regarding factors that may influence the interactions, for example 'background noise'. Additionally,
44 write down any information that may be missed in the video data, for example, people out of the camera frame,
45 interactions that may be overheard in the room that might impact on the current interactions.
46
47
48
49

50 Draw a line under the final comment after the one-minute observation had been completed. Write any additional
51 observations within the final 4 minutes below this line (see example).
52
53
54
55

56 If you have any queries or questions regarding this observation protocol or the observation protocol please contact
57 chief investigator Sarah D'Souza.
58
59
60

Stroke participant information and consent form

Communication activity in hospital

This research project is being undertaken as **part of the requirements** of a **PhD at Edith Cowan University**.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

1 You are **invited** to participate in a research project. Sarah D'Souza, a
2 speech pathologist and PhD student is leading the study as Chief
3 Investigator. This study has received ethical **approval** from **ECU** Human
4 Research **Ethics Committee** and the Hollywood Private Hospital
5 Research Ethics Committee.
6
7
8
9

10
11
12
13
14 This project is investigating the **hospital environment** to see how this
15 **influences** patient **communication activity**. Communication activity
16 involves communication, such as **talking** with other patients,
17 **socialising**, **reading** the paper, using the **telephone**, talking to staff, or
18 engaging in group activities including **therapy**.
19
20
21
22
23
24

25
26
27 **You** have been **selected** to participate as you have had a **stroke** and
28 are receiving **treatment at Hollywood Private Hospital**. We are
29 **interested** in seeing **how** the hospital **surroundings affect what you**
30 **do** throughout the day.
31
32
33
34
35
36

37 **What would you have to do?**

38
39
40 You will be **asked** to provide **consent** to **agree to participate** in the
41 study.
42
43
44

45 You will be **asked to consent** to:
46
47
48
49
50

- 51 • Complete **three tests** to see how your stroke has affected **you**
52 including your **language, concentration** and **memory**. These tests
53 will be conducted at the **beginning of the project**. The tests will take
54 approximately **1 hour** to complete with an option to complete the tests
55
56
57
58
59
60

1 over **two separate 30 minute sessions** and with as many **breaks** as
2 you may need.
3
4
5

- 6
7
8 • A **researcher** spending approximately **1 hour discussing with you**
9 your **opinion** regarding **how** your rehabilitation **surroundings affect**
10 **your stay in hospital** and **your communication activity** levels.
11
12
13
14
15
16 • A researcher **video recording, observing** and **writing down** what is
17 happening in your **environment** including **your activities**. You will be
18 observed and recorded for a total of **12 hours** over **3 days**.
19
20
21
22
23
24

25
26 You may **not want** to be **video recorded**. If you **request**, you will
27 **not** be **video recorded**. You can ask not to be video recorded at **any**
28 **time**. In this case the researcher will **only observe, audio record**
29 and **write down** what is **happening in your** environment **including**
30 your activities.
31
32
33
34
35
36
37
38
39

- 40 • A researcher **looking at your hospital medical file** to collect
41 **information** regarding:
42
43
44 • Your **details** (such as your age, your living arrangements, your
45 occupation and your level of functioning before your stroke)
46
47
48 • Any **conditions** or **diseases** you may have
49
50
51 • Information about your **stroke** (for example when it happened, the
52 **area** of the **brain** affected, how it has **affected your functioning**
53 and **abilities**)
54
55
56 • Details about **how long** you have **been in hospital** since your
57 stroke
58
59
60

1
2
3 If you decide to participate in this study, you **will not miss out** on any
4 **treatment**. Participation will **not cost** you **anything** and **after**
5
6
7 completing the **tests** and the **interview** you will be asked to continue
8
9 participating in your **normal activities**.
10
11
12
13
14

15 We will **not record** if you are **behind closed curtains** or completing
16
17 sensitive tasks such as when you are in the **toilet** or **shower**.
18
19
20
21
22

23 We may use the **recordings** of **you** to make a **training package**
24
25 (including a video). You can have **your face blurred out** if you want. If
26
27 you **do not want** to be in the training package we will **not include you**
28
29 in the training package or video.
30
31
32
33
34

35 Your hospital **discharge** will **not be affected** because you are in this
36
37 study. **You** will be **discharged** from hospital when the hospital **medical**
38
39 **team decides** that you are **ready**.
40
41
42
43

44 There are **no known risks** of participating in this study. If you feel
45
46 uncomfortable at any time, you are free to **tell the researcher** and
47
48 **observations** within your room will **stop immediately**. You may
49
50 become **upset** during the **tests** or the **interview**. If this happens you
51
52 can **ask** to take a **break or stop** the interview.
53
54
55
56

57 There will be **no immediate benefit** to you from participating in this
58
59 research; however your participation will allow the collection of
60

1 information that may **help improve** stroke **hospital wards** which may
2 **benefit** future stroke survivors.
3
4
5

6 **Participating** in this study is completely **voluntary**. You **do not have**
7 **to** participate if you don't want to. If you decide to participate you may
8 **withdraw** at **any time** without giving a reason and withdrawing **will not**
9 **disadvantage** you in any way and will **not affect** your hospital
10 **treatment**. If you **decide** that you do **not want to participate** in the
11 study, you **can ask to remove** all of your **information** from the study.
12
13
14
15
16
17
18
19
20
21

22 All the **information** you give will be **confidential**. You will **not be**
23 **identified** by name. You will be **assigned** a unique **code** and any
24 information that may reveal your **identity** will be **removed**.
25
26
27
28

29 All personal health information will be accessed, used and stored in
30 accordance with Commonwealth Privacy Laws. **Information** from all the
31 people in the study is **combined** and **summarised**.
32
33
34
35
36
37
38

39 We will **store** all your electronic **information** on a **password locked**
40 **computer** and **password locked hard drive only accessible by the**
41 **Chief Investigator**. Your hard copy information will be **kept** in a **locked**
42 **cabinet** at Edith Cowan University. Your information will **only** be
43 **accessible to researchers** named on **this study**.
44
45
46
47
48
49
50
51
52

53 The **results** of this study may be **published** in research **journals** or
54 presented at **conferences**. Your **name** will **not** be **used**.
55
56
57
58
59
60

1 **Data** may be **used** in higher degree by **research studies** in the **future**.
2 **Confidentiality** will be **maintained** and no identifying information will
3 be used.
4
5
6
7
8
9

10 **Data** will be **accessible by researchers** through data sharing archives.
11 This data will be governed by an overarching body to ensure data is **only**
12 **used for approved research** purposes. Researchers who access this
13 data from the data bank will not have access to participant information
14 and therefore **will not know your identity**.

Person responsible information sheet
Stroke patients' communication activity in hospital

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccione	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

The participant is invited to take part in a research project. Sarah D'Souza, a Speech Pathologist and PhD student, is leading the study as Chief Investigator. This study has received ethical approval from ECU Human Research Ethics Committee and Hollywood Private Hospital Research Ethics Committee.

This project is investigating the hospital environment to see how this influences patient activity.

The participant has been selected to take part in this study as they have had a stroke and are receiving treatment at Hollywood Private Hospital. We are interested in

1 seeing how the hospital surroundings affect their communication activity throughout
2 the day. Communication activity involves communication, such as talking with other
3 patients, socialising, reading the paper, using the telephone, talking to staff, or
4 engaging group activities including therapy.
5
6
7
8

9 This information sheet will explain the research project and will detail what is involved in the
10 study. You will be given a copy of this information to keep for your reference.
11
12
13
14

15 Please read through all of the information carefully. You can ask the researcher questions
16 about the study at any time.
17
18
19
20
21

22 **Purpose of the research**

23
24 Little is known about the impact of the hospital rehabilitation environment on patient
25 communication activity levels during stroke recovery. This study will investigate how the
26 hospital stroke ward environment influences patient communication activity levels. The
27 information gathered from this study will assist in improving the Hollywood Private Hospital
28 stroke ward environment to help the recovery of stroke survivors in the future.
29
30
31
32
33
34
35

36 **What does the stroke patient have to do?**

- 37
38
39
40 • Complete three tests and a recording of them talking to see how their stroke has
41 affected their functioning including their language, concentration and memory. These
42 tests will be conducted at the beginning of the project. The tests will take
43 approximately 1 hour to complete with an option to complete the tests over two
44 separate 30 minute sessions and with as many breaks as the participant needs.
45
46
47
48
- 49
50
51 • Spend approximately 1 hour discussing with the researcher their opinion regarding how
52 their rehabilitation surroundings affect their stay in hospital and activity levels.
53
54
55
- 56
57 • Allow the researcher to video record, observe and write down what is happening in the
58 participant's environment including their activities for a total of 12 hours over a 3 day
59 period. Video recording is a useful way of capturing the details of everyday activities on
60

1 the ward. Often, people forget that the camera is there. Obviously, personal or private
2 activity such as toileting would not be filmed. The participant may not want to be video
3 recorded. If they request, they will not be video recorded. In this case the researcher
4 will only observe, audio record and write down what is happening in their environment
5 including their activities.
6
7
8
9

- 10
- 11 • A researcher will look at the participant's hospital medical file to collect information
12 regarding:
13
 - 14 • The participant's details (such as their age, living arrangements, occupation and
15 level of functioning before stroke)
 - 16 • Any relevant conditions or diseases the participant may have
 - 17 • Information about the participant's stroke (for example when it happened, the
18 area of the brain affected, how it has affected their functioning and abilities)
 - 19 • Details about how long the participant has been in hospital since their stroke
- 20
21
22
23
24
25

26 The participant will not miss out on any treatment. Participation will not cost anything. After
27 completing the tests and the interview the participant will be asked to continue their normal
28 activities.
29
30
31

32
33
34 The participant's hospital discharge will not be affected because they are in this study. The
35 participant will be discharged from hospital when the hospital medical team decides that they
36 are ready.
37
38
39

40
41
42 There are no known risks of participating in this study. If the participant feels uncomfortable
43 at any time, you or the participant are free to tell the researcher and observations within
44 their room will stop immediately. The participant may become upset during the tests or the
45 interview. If this happens you or the participant can ask to take a break or stop the interview.
46
47
48
49

50
51
52 There will be no immediate benefit to you or the participant from taking part in this research;
53 however **their participation will allow the collection of information that may help**
54 **improve stroke hospital wards which may benefit future stroke survivors.**
55
56
57
58
59
60

1 Participating in this study is completely voluntary. The participant can withdraw from taking
2 part in the study at any time without giving a reason for withdrawing.
3
4
5

6 The participant can request access to their research data at any time. They can request any
7 of the information collected to be amended or removed if it is incorrect or they disagree with
8 it. Please contact Sarah D'Souza (phone: 0439 982 451) if you would like to discuss
9 accessing the participant's information.
10
11
12
13
14
15

16 The video, audio and written data will be identified by code. The information you provide will
17 remain completely confidential. There will be no identifying information attached to the data
18 and any information that may reveal the participant's identity will be removed. A list of
19 participant names and codes will be kept in a locked filing cabinet at Hollywood Private
20 Hospital and will only be accessible by the research team. All personal health information will
21 be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will
22 be stored on a password controlled computer or in a locked cabinet at Edith Cowan
23 University. Electronic data will be backed-up on a password controlled hard drive only
24 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after
25 completion of the study. Video and audio recordings will then be permanently deleted and
26 hard copy data will be shredded.
27
28
29
30
31
32
33
34
35
36
37

38 Non-identifiable data will be accessible by researchers through data sharing archives. This
39 data will be governed by an overarching body to ensure data is only used for approved
40 research purposes. Researchers who access this data from the data bank will not have access
41 to participant information therefore data will not be re-identifiable.
42
43
44
45
46

47 The results of this study may be published in research journals or presented at conferences.
48 The results will not include any information that may identify participants. Data may be used
49 in higher degree by research studies in the future. In this circumstance, confidentiality will be
50 maintained and no identifying information will be used.
51
52
53
54
55
56

57 Data collected from this study (including videos) may be used to develop training packages to
58 improve future stroke survivors' communication activity levels in the future. We can blur out
59
60

1 the participant's face if they want. If they do not want to be in the training package we will
2 not include them in the training package.
3
4
5

6 At the end of the research project a summary of the results will be provided to you and the
7 participant.

Description of the research project

This study is exploring stroke patient's experiences in regards to the environment of an in-patient stroke rehabilitation unit. We want to explore stroke patient communication activity, which includes activities such as talking with other patients and visitors, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy.

The participant has agreed to take part in this study. They have agreed to be video recorded for a total of 12 hours over a three day period.

Your interactions with the patient will be video recorded and manually recorded by the chief investigator to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. You do not need to do anything other than complete your usual tasks and activities. We will not record if you are having sensitive conversations with the participant, if they are behind closed curtains or completing sensitive tasks such as toileting or showering.

1 We may use the recordings of you to make a training package (including a video). You can have your face
2 blurred if you want. If you do not want to be in the training package we will not include you in the training
3 package.
4

5
6
7
8 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
9 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
10 without giving a reason and withdrawing will not disadvantage you or the participant in any way.
11
12
13

14
15 You may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you
16 may not benefit from participating in this study. There are no known risks associated with participating in
17 this study.
18
19
20
21
22

23 **Confidentiality of information**

24
25 The video, audio and written data will be identified by code. There will be no identifying information
26 attached to the data and any information that may reveal your identity will be removed. A list of participant
27 names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be
28 accessible by the research team. All data will be accessed, used and stored in accordance with
29 Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked
30 cabinet at Edith Cowan University. Electronic data will be backed-up on password controlled hard drive only
31 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the
32 study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Staff information and consent form

Investigating Enriched Environments after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is exploring staff and stroke patient's experiences in regards to the environment of the Edwards and Woods wards at Hollywood Private Hospital. We want to explore stroke patient communication activity, which includes activities such as talking with other patients, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy. We would like to explore staffs' perceptions of barriers and facilitators to communication activity on the wards and address these in order to enhance the ward environment.

Staff have been selected to participate in order to gain a range of perspectives in regards to the day to day operations, procedures, policies and interactions that influence the environment of the Edwards and Woods wards. A training program for staff will be designed to address barriers and facilitators identified on the wards.

There are two components of this research study that involve staff. You may wish to consent to participate in one or both parts of this study.

1
2
3 **Part 1:** Stroke in-patients will be video recorded for a total of 12 hours over a three day period. Your
4 interactions with the patient will be video recorded and manually recorded by a member of the research
5 team to explore patient communication activity levels. You can choose to be observed by the researcher
6 only if you do not want to be video recorded. You do not need to do anything other than complete your
7 usual daily tasks and activities. We will not record if you are behind closed curtains or completing sensitive
8 tasks such as toileting or showering the patient.
9
10
11
12
13
14

15 We may want use the recordings of you to make a training package (including a video). We will show you
16 the video we want to use and explain exactly how this will be used before we do anything. You can have
17 your face blurred out if you want. If you don't want to be included in the training package we will not include
18 any videos of you in the training package.
19
20
21
22
23

24 **Part 2:** You will be asked to take part in the following:
25

- 26 • A focus group with the researcher and your co-workers for approximately 1 hour to explore your
27 perceptions of environmental barriers and facilitators to activity.
- 28 • Attend a training program for approximately 1.5 hours. This will focus on training staff to promote
29 patient communication on the ward. This session will be located at Hollywood Private Hospital and
30 will be offered over several dates to facilitate your ability to attend. If you are unable to attend the
31 training program we may provide training and video resources to facilitate your participation in
32 training.
- 33 • Complete an anonymous short questionnaire before and after attending the training program to gain
34 feedback on training and explore your perception of changes in your knowledge, skills and attitudes
35 towards communication and aphasia.
- 36 • A final focus group with the researcher for approximately 1 hour to again explore your perceptions
37 of environmental barriers and facilitators to activity.

38 The focus groups will be tape recorded however at any stage you may ask for the tape to stopped,
39 edited or have your comments erased.
40
41
42
43
44
45
46
47
48
49
50

51 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
52 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
53 without giving a reason and withdrawing will not disadvantage you in any way.
54
55
56
57
58

59 You may benefit from gaining knowledge and skills regarding communication from attending the training
60 program. Additionally, you may also benefit from the knowledge that you are helping future stroke

1 survivors. It is possible that you may not benefit from participating in this study. There are no known risks
2 associated with participating in this study.
3
4
5

6 **Confidentiality of information**

7

8 The information you provide during the interviews will be audio recorded by the Chief Investigator. Your
9 perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'. This will be
10 used to inform the development and review of the training program.
11
12
13

14
15
16 The video, audio and written data will be identified by code. The information you provide will remain
17 completely confidential. There will be no identifying information attached to the data and any information
18 that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked
19 filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be
20 accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a
21 password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be
22 backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be
23 stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be
24 permanently deleted and hard copy data will be shredded.
25
26
27
28
29
30
31
32

33 Non-identifiable data will be accessible by researchers through data sharing archives. This data will be
34 governed by an overarching body to ensure data is only used for approved research purposes.
35 Researchers who access this data from the data bank will not have access to participant information
36 therefore data will not be re-identifiable.
37
38
39
40
41
42

43 The results of this study may be published in research journals or presented at conferences. The results
44 will not include any information that may identify participants. Data may be used in higher degree by
45 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
46 information will be used.
47
48
49
50

51 A summary of the results will be provided through Hollywood Private Hospital 18 months after the
52 completion of the study.
53
54
55
56

57 Please read this Information Statement and be sure you understand its content before you consent to take
58 part.
59

Description of the research project

This study is a Communication Enhanced Environment (CEE) at Hollywood Private Hospital. A CEE involves several initiatives that aim to provide more opportunities for communication for stroke survivors on the ward. One of these initiatives involves the participation of volunteers.

As a volunteer participant, you will be asked to take part in the following:

- Attend a training program for approximately 1.5 hours. This will focus on training volunteers in communicating with stroke patients with communication difficulties. This session will be located at Hollywood Private Hospital and will be offered over several dates to facilitate your ability to attend. If you are unable to attend the training program we may provide training and video resources to facilitate your participation in training.
- Complete an anonymous short questionnaire before and after attending the training program to obtain your feedback on the training session.

- A focus group with the researcher and other volunteers for approximately 1 hour to explore your perceptions of communicating with stroke patients. The focus group will be tape recorded however at any stage you may ask for the tape to stopped, edited or have your comments erased.
- Host a communal dining and lounge area once a week to offer tea and coffee and provide social companionship for stroke patients.
- Your interactions with the patient may be video recorded and manually recorded by a member of the research team to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. We will not record if you are having sensitive conversations with the stroke patient/s.

There will be no cost to you associated with participating in this study. Participation is completely voluntary. You do not have to participate if you don't want to. If you decide to participate you may withdraw at any time without giving a reason and withdrawing will not disadvantage you in any way.

You may benefit from gaining knowledge and skills regarding communication from attending the training program. Additionally, you may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you may not benefit from participating in this study. There are no known risks associated with participating in this study.

Confidentiality of information

The information you provide during the interviews will be audio recorded by the Chief Investigator. Your perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'.

The video, audio and written data will be identified by code. The information you provide will remain completely confidential. There will be no identifying information attached to the data and any information that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data is only used for approved research purposes.

1 Researchers who access this data from the data bank will not have access to participant information
2 therefore data will not be re-identifiable.
3
4
5

6 The results of this study may be published in research journals or presented at conferences. The results
7 will not include any information that may identify participants. Data may be used in higher degree by
8 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
9 information will be used.
10
11
12
13
14

15 A summary of the results will be provided through Hollywood Private Hospital 18 months after the
16 completion of the study.

Abstract

Objectives: To explore barriers and facilitators to patient communication in an acute and rehabilitation ward setting from the perspectives of hospital staff, volunteers and patients following stroke.

Design: A qualitative descriptive sub-study within a larger study which aimed to develop and test a Communication Enhanced Environment in an acute and a rehabilitation ward.

Setting: A metropolitan Australian private hospital.

Participants: Focus groups with acute and rehabilitation doctors, nurses, allied health staff and volunteers (n=51) and interviews with patients following stroke (n=7), including three with aphasia, were conducted.

Results: The key themes related to barriers and facilitators to communication, contained sub-categories related to hospital, staff and patient factors. Hospital related barriers to communication were private rooms, mixed wards, the physical hospital environment, hospital policies, the power imbalance between staff and patients, and task specific communication. Staff related barriers to communication were staff's perception of time pressures, underutilisation of available resources, staff individual factors such as personality, role perception and lack of knowledge and skills regarding communication strategies. The patient related barrier to communication involved patients' functional and medical status. Hospital related facilitators to communication were shared rooms/co-location of patients, visitors and volunteers. Staff related facilitators to communication were utilisation of resources, speech pathology support, staff knowledge and utilisation of communication strategies and individual staff factors such as personality. No patient related facilitators to communication were reported by staff, volunteers or patients.

Conclusions: Barriers and facilitators to communication appeared to be interconnected and likely to influence one another suggests communication access may vary between patients within the same setting. Practical changes may promote communication opportunities for patients in hospital early after stroke such as access to areas for patient co-location as well as areas for privacy, encouraging visitors, enhancing patient autonomy, and providing communication trained health staff and volunteers.

Study strengths

- This study involved a large number of staff in comparison to previous studies and included volunteers working within the acute and rehabilitation wards as well patients following stroke with and without aphasia.
- Data saturation was reached within the staff focus groups.

Study limitations

- The results in this study reflect the perceptions of a small number of medical (n=2) and nursing staff (n= 11) compared to allied health staff (N= 32) which may be reflected in the results.
- This study involved exploring the perceptions a small number of patients; a broader range of perspectives may have been expressed with a larger number of participants.
- This study was conducted at a private hospital involving a mixed acute and a mixed rehabilitation ward, and a relatively homogenous groups of participants linguistically and ethnically, therefore these results reflect this context and may not be directly generalisable to hospitals in the public sector, nor did they explore cultural factors contributing to communication.

Background

Aphasia research supports the theory that commencing aphasia rehabilitation in the early phase post-stroke (<1-month post-stroke) results in better outcomes than therapy commenced in the chronic phase (>6-months post stroke).^{1,2} However, patients in hospital following stroke spend on average 65-94% of their day inactive.³ Despite improvements in functional independence during their hospital admission following stroke, patients' engagement in cognitive and social activity remains largely unchanged.⁴ Patients with aphasia spend two thirds less time engaged in social interactions with family and friends compared to those without aphasia.⁵ A lack of social and cognitive activity early after stroke for patients with aphasia has the potential to contribute to: i) the development of maladaptive compensatory communication behaviours, and ii) the learned non-use of language, which may ultimately impact on their quality of life and overall language recovery.⁵

Patients following stroke with and without aphasia have described time outside therapy as "dead" and "wasted", reporting a lack of stimulation and inactivity in hospital impacting their ability to self-direct their rehabilitation outside of therapy.⁶ They report the experience of boredom is worse in the evenings and weekends when there are less structured activities.⁷ They also perceive that boredom negatively influences their mood, motivation, and contributes to their experience of post-stroke fatigue.⁷ Boredom is associated with a loss of autonomy and sense of control and contributes to patients becoming passive recipients of care, which may have negative implications for stroke recovery.⁷

This study aimed to explore hospital staff and volunteer, and patient perceptions of barriers and facilitators to patient communication in an acute and a rehabilitation hospital ward. Identifying barriers and facilitators to patients' communication will inform the development of a Communication Enhanced Environment (CEE) for the purposes of increasing their engagement in language activity within a hospital ward to maximise post-stroke aphasia language recovery.

Methods

Design

This was a sub-study of a larger study which aimed to develop and test a CEE model within an acute and a rehabilitation ward (see supplementary file for study protocol and

1
2
3 procedure). This sub-study contributed to the baseline phase of the larger study outlined
4
5 below:

- 6
7 i) *Baseline phase*: observe and quantify levels of engagement in language activity in the
8 acute and rehabilitation ward environment for patients following stroke, and explore
9 hospital staff, volunteers, and patients' perceptions of barriers and facilitators to
10 communication in hospital;
11
12 ii) *Implementation phase*: develop and implement the CEE model on the acute and
13 rehabilitation wards;
14
15 iii) *Post-implementation phase*: assess the impact of the CEE mode on patient
16 engagement in language activity, and hospital staff, volunteers and patients'
17 perceptions of barriers to communication in hospital.
18
19
20
21
22
23

24 **Reporting guidelines**

25
26 The consolidated criteria for reporting qualitative studies (COREQ)⁸ was used to
27 guide reporting this study (Appendix C.).
28
29

30 **Research authors' relationship with participants**

31
32 The first author who was external to the hospital conducted focus groups and
33 interviews. The first author engaged key hospital team members for the duration of the
34 study to inform the study design to ensure it aligned with the hospital policies and priorities.
35
36
37

38 **Patient and public involvement**

39
40 Patients and the public were not involved in the design of this study however this
41 data informed the development of the CEE model in the larger study. A working group
42 consisting of key members of the stroke multidisciplinary team provided feedback on this
43 study's findings and were involved in the development of the CEE model and embedding
44 approach, which was based on the outcomes of this sub-study.
45
46
47

48 **Setting**

49
50 This study was conducted on an acute and a rehabilitation ward at a private hospital
51 in Perth, Western Australia. The acute ward was a 26- bed unit with patients following acute
52 stroke as well as other medical conditions. The acute ward had four individual rooms and
53 nine shared rooms, two rooms with four beds per room, and seven rooms with two beds
54 per room. Patients ate meals in their rooms and had access to an outdoor balcony area. The
55 rehabilitation ward was a 44-bed mixed rehabilitation unit for patients following stroke and
56
57
58
59
60

other medical, orthopaedic and post-surgical conditions. There were thirty-six individual rooms, and four shared rooms with two beds in each room. Patients had breakfast in their rooms but were encouraged to eat lunch and dinner in one of two communal dining areas.

Participants

Hospital staff participants: Purposeful sampling of acute and rehabilitation hospital staff was conducted to include at least one representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members who were over 18 years of age. A total of 51 staff and volunteers were recruited (Table 1.) by contacting staff department managers who identified staff currently working or had previously worked with patients following stroke on the acute or rehabilitation wards.

1
2
3 *Patient participants:* All patients consecutively admitted following stroke from
4 January to February 2016, and June 2016 to July 2017 were screened for eligibility to
5 participate in the study. Inclusion criteria: i) admitted to the acute or rehabilitation ward
6 with an acute stroke, ii) less than 21 days post-stroke during data collection, iii) able to
7 provide informed consent based on the judgement of the medical team responsible for the
8 medical management of the patient, iv) Glasgow Coma Scale⁹ greater than 10, v) estimated
9 total length of hospital stay greater than 14 days, vi) adequate English proficiency to
10 participate in interviews as determined by managing speech pathologist or medical team.
11 Exclusion criteria: i) uncorrected hearing or vision (for example hearing impairment without
12 the use of hearing aids or vision impairment without the use of glasses), ii) medically
13 unstable, iii) documented diagnosis of current untreated depression, documented diagnosis
14 of dementia, previous aphasia or traumatic brain injury. The diagnosis of aphasia was
15 confirmed for those who achieved a Western Aphasia Battery-Revised¹⁰ Aphasia Quotient
16 score less than 93.7. A total of 9 patients were recruited, however 2 patients were
17 withdrawn as they became medically unwell. Data collection was completed for 4 patients
18 without aphasia and 3 patients with aphasia. See Figure 1. for the summary of patient
19 screening and recruitment. Patient details and demographics are detailed in Table 2.

20
21
22 No staff or patients withdrew from participating in this study.

23 24 25 **Data collection**

26 The first author, a female speech pathologist (Bachelor of Speech Pathology,
27 Honours) and PhD student with seven years clinical experience working in the hospital
28 setting and five years research experience, including conducting interviews and focus
29 groups, completed all semi-structured interviews and focus groups. Staff were informed
30 that the researchers wanted to investigate their perceptions of the hospital ward
31 environment in regards to communication opportunities to inform the development of a
32 Communication Enhanced Environment (see supplementary file for staff and volunteer
33 information and consent forms). Patients were informed that the researchers wanted to
34 explore how the hospital environment influenced patient activity (see supplementary file for
35 patient information and consent forms).

36 All interviews and focus groups were conducted using interview and focus group
37 guides (staff focus groups and interview guide Appendix A., patient interview guide
38 Appendix B.) and were audio recorded. Field notes were completed by the first author

1
2
3 during data collection. Seven staff focus groups were conducted with two to eight
4 participants in each focus group. One-on-one interviews were conducted with two staff
5 members. All staff focus groups were completed on the hospital site in various locations
6 that were private and quiet. Six out of seven patient interviews were conducted in person
7 during their inpatient admission in their hospital room, and one was completed over the
8 phone (patient without aphasia) one day following discharge from hospital. All patient
9 interviews were conducted within fifteen days post-stroke. Interview and focus groups were
10 20-60 minutes long, often varying based on the number of participants. Supported
11 conversation strategies¹¹ were used during interviews with patients with aphasia to
12 facilitate their participation in the interview. One patients with aphasia had two family
13 members present during the interview. During the interviews and focus groups, clarifying
14 questions and paraphrasing participant comments were used to confirm and clarify their
15 perspectives and insights.

Average number of days in single room per participant (%)	3.1 (96)	3 (90)	3.3 (100)

Notes: PWA= patient with aphasia; PWOA= patient without aphasia; NIHSS=National Institute of Health Stroke Scale¹²; MoCA= Montreal Cognitive Assessment¹³; WABAQ=Western Aphasia Battery-Revised¹⁰ Aphasia Quotient score.

Data analysis

Focus groups and interviews were transcribed verbatim. Responses to any leading questions were removed from the data set.¹⁴

The theoretical framework for this research was a qualitative description approach.¹⁵ This approach involves describing patient experiences, with minimal interpretation of the data to minimise potential bias of the researchers.¹⁵ Participant experiences were analysed using NVivo¹⁶ computer software to manage the data. Data were grouped into themes according to content.¹⁵ The first level of coding identified the broad content of the data then sub-categories were identified.¹⁵ Single lines of data were not removed from their 'story' during data analysis to maintain the context and help ensure meaning was not lost or misinterpreted.¹⁵ Ongoing critical review of the categories were conducted and themes were reviewed by a second researcher.¹⁵ Staff were provided feedback on the findings.

Results

The key themes from the focus group and interviews related to barriers and facilitators to communication, with sub-categories identified which related to hospital, staff and patient factors (Figure 2.).

Barriers to Communication

Hospital related factors

Private rooms reduce opportunities for social interaction

Staff and patients described the impact of single rooms which limited incidental socialisation with other patients and their visitors.

We used to co-locate our stroke patients and often using our shared rooms. That's when people had more opportunities for interacting with one another. (MedC1)

Mixed wards affect staff acquisition of specialist skills

Staff described their perception of the negative effect a mixed hospital ward had on the acquisition of stroke specific specialist skills.

Having a stroke specific ward... everybody on the ward would be trained...and that's the only thing they'd have to focus on rather than having lots of other patients with lots of medical conditions. (OT4)

Hospital environment does not encourage socialising

Staff talked about the physical hospital ward environment affecting social interaction as it contributed to a sterile atmosphere rather than one that promoted social activity. Staff also talked about the consequence of background noise and environmental distractors in large shared rooms on the acute ward which reduced their ability to communicate with patients with communication impairments.

My general feeling of rehab [rehabilitation] is that they come to their sessions and then they go back to their lonely dark room... I don't really see the rooms as a particularly happy, busy place where they are getting a lot out of being in there... the dining rooms... they're not a particularly pleasant place to be either. (PT2)

They [patients] can hear other people talking... there is [sic] a lot of voices going on which is going to impact on their understanding as well. (PT3)

Hospital policies restrict the development of communication-promoting ideas and initiatives

Hospital policies were perceived by staff as a barrier to communication, negatively influencing their ability to develop ideas and initiatives to increase patients' opportunities for social interaction. This included policies regarding leaving patients unattended in dining areas without patient care assistants supervising them, and requiring nurses to supervise

1
2
3 patients if they are eating; and reported limitations around food related activities as a result
4 of food hygiene policies and occupational health and safety.

5
6
7 It's just every time you try and do something you hit a barrier... you do try and think
8 outside the box what more can you do for this patient and you get another hospital
9 rule. (PT2)
10

11 12 **Power imbalance of staff and patients in hospital controls patients' ability to access** 13 **communication opportunities**

14
15
16 Staff and patients discussed the influence of the power imbalance for patients in
17 hospital, and patient perceptions that they have to do what is expected in the hospital
18 environment. This appeared to limit the patients' ability to freely engage and explore the
19 environment resulting in patients retreating to their rooms and limiting their opportunities
20 to engage in activities.
21
22

23
24
25 I think most males like to account for their time um and I felt like I haven't been able
26 to do that and that's, that's the bit that I'm really, really lacking. (PWA2)

27
28 I was in the hospital so I think I had to stick into the room, to the rules. (PWOA2)

29
30 Very often when you're in a hospital you do what you think you're expected to do.
31
32 (SP4)
33

34 **Task specific communication reduces patients' communication opportunities**

35
36 Staff talked about the nature of interactions with patients as often being driven by
37 the patient's care, restricting opportunities for communication beyond this context.

38
39 I know we aim to be very holistic... but very often care is very[sic] directed from a
40 medical health care perspective (SP4)
41
42

43 **Staff related factors**

44 45 **Staff's perception of time pressures limiting opportunities for communication**

46
47 Both patients and staff perceived staff time pressures as a barrier negatively
48 effecting communication on the wards. This may be the reflection of actual time pressures,
49 or staff perceptions of their available time. Some staff reported that they felt interactions
50 with patients with communication impairments required extra time which was challenging
51 in a time pressured hospital environment. Time pressures were also perceived to restrict the
52 staff's ability to facilitate opportunities for patients to socialise with other patients. For
53 example, nurses appeared to deprioritise transferring patients to the communal area for
54 lunch in busier times.
55
56
57
58
59
60

1
2
3 If they're hoist patients it might not be as easy for staff to get them to the dining
4 room, that wouldn't totally prevent someone from going, it would just depend on
5 the time that people had on the day. (SW3)
6
7

8 **Staff and patient's underutilisation of available resources**

9
10 Staff described the lack of accessible resources as a factor negatively affecting staff-
11 patient communication. They described the need for resources when communicating with
12 patients with aphasia and other communication impairments but felt unsure about what
13 these were or how to access them. They also described a number of resources that they felt
14 patients were not aware of and therefore did not utilise such as volunteer services that
15 promote communication opportunities and facilitate patient access to outdoor areas.
16
17

18 I feel like I don't know where else to go. I don't know if other things that [sic] could
19 help us, maybe there's things out there that I don't know about that would help us
20 communicate with these patients. (PT2)
21
22

23 There are all of these opportunities but I don't think a lot of the patients access them
24 so it sounds like great communicative opportunities for them but the reality is that a
25 lot of them are sitting in their rooms most of the times by themselves watching
26 television and most of the interactions they have is with the nurses or just whoever
27 comes in to see them. (SP4)
28
29

30 **Individual staff factors leading to restricted opportunities for communication**

31 Staff described individual staff factors such as personality, values and attitudes
32 influencing communication opportunities for patients, such as staff providing patients with
33 opportunities for incidental social interaction during routine tasks.
34
35

36 Often if people need to go in and see the patient let's just say to take obs
37 [observations] or to do a wash... they don't always use that opportunity as an
38 opportunity to chat... there could be more opportunity to chat at those times whilst
39 they are doing what they need to get done and you know that varies from person to
40 person, personality as well and how busy people are, what else is going on. (SP3)
41
42

43 **Staff's perception their role does not include communication tasks**

44 Some staff perceived communication as a task separate from the responsibility of
45 their role therefore limiting their facilitation of communication opportunities for patients.
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 They [speech pathologists] do their bit and we do ours... we don't have time to
4 practice speech with them because we really do have to get all of our jobs filled in
5 the time and it's specifically rostered for us to do our work, not to help with
6 someone else's. (RehabN1)
7
8
9

10 **Lack of staff knowledge and skills resulting in unsuccessful communication interactions or** 11 **avoiding communication interactions** 12 13

14 Staff described a lack of knowledge and skills in communicating with patients with
15 communication impairments. Some staff reported feeling anxious about encouraging
16 patients to communicate as communication breakdowns may cause stress and anxiety for
17 the patient, and the staff member. Staff reported a lack of confidence in their ability to
18 repair communication breakdowns which resulted in increased time pressures in their
19 sessions, often leading them to avoid encouraging communication interactions within their
20 treatment sessions.
21
22
23
24
25
26

27 I find it challenging... knowing how the best way to communicate with that person
28 [with aphasia]... then [they] become very frustrated and not have the tools
29 themselves to communicate back to me and you would never want to leave
30 someone in that space. So that's something that I struggle with. (SW2)
31
32
33
34

35 **Patient related factors**

36 Patient related factors reflected their functional and medical status, personality,
37 mood and motivation, which were perceived by staff and patients to often act as a barrier to
38 engaging in communication interactions during their hospital admission early after stroke.
39
40

41 **Patients' functional and medical status limiting their ability to seek out and engage in** 42 **activities** 43 44

45 Staff and patients perceived patients' medical status as a barrier to communication
46 by limiting their ability to engage with their environment including independently seeking
47 out activities and being able to utilise communal areas.
48
49

50
51 If someone is bed bound, you know the interaction is very minimal... you often walk
52 past and you see them alone in their room... you wonder what happens during those
53 periods of time where they're just in their room and they don't have family. (OT2)
54
55 Well, I can't do anything cos I can't go off by myself and do anything. (PWOA2)
56
57

58 **Individual patient factors limiting opportunities for communication** 59 60

1
2
3 Staff described individual patient factors such as personality, mood and motivation
4 communication opportunities for patients such as independent practice of communication
5 therapy tasks, and social opportunities with patients and hospital staff.
6
7

8 We have to recognise some patients who have had strokes... they're fed up with
9 having people poking and prodding them then have a volunteer and go "do you want
10 to do your exercises for speech?" (VM)
11
12

13 They need a break after OT [the occupational therapist] has done a shower. If they
14 don't get that break then the physio isn't going to be as good for them because
15 they're so tired, so we also have to look at break times in between each sessions...
16
17
18
19 (OTA1)
20

21 **Facilitators to Communication**

22 **Hospital related factors**

23 **Shared rooms/co-location encourages incidental social interactions**

24 Staff talked about use of communal areas at other hospitals which facilitated
25 socialisation and communication during non-therapy times and during group therapy. Staff
26 described the importance of the use of communal areas given the large number of private
27 rooms on the ward. Patients also described the need to be co-located to promote social
28 interaction.
29
30
31
32
33
34
35

36 I think that, put the [sic] whole lot of people together and ah and they [sic]
37 something collective, that's what human beings are put together for ... sitting around
38 talking... over the proverbial cuppa. (PWA2)
39
40
41

42 **Visitors provide patients opportunities for socialisation**

43 Staff identified visitors as a facilitator to communication interaction for patients
44 outside of therapy times during their inpatient admission.
45
46

47 Interaction with the family... it's not therapy based but it's their [patients']
48 opportunity to practice. (PT1)
49
50

51 **Volunteers facilitate opportunities for patients to engage in social activities**

52 Staff discussed the benefit of volunteers in facilitating opportunities for patients to
53 engage in social interactions including programs involving therapy dogs, book loaning, hand
54 massages, and taking patients off the ward.
55
56
57
58
59
60

1
2
3 If we see people that are lonely, are not getting visitors, there's many volunteers... to
4 go and visit them and if they're well enough they can take them out... the volunteers,
5 we do rely on them. (OTA1)
6
7
8
9

10 **Staff related factors**

11 **Staff utilisation of resources promote communication exchange**

12 Staff identified access to resources such as chat books and alternative and
13 augmentative communication boards often facilitated communication interactions with
14 patients with communication impairments on the ward.
15

16 Sometimes with the ... signs... "do you want to drink? some water?" or something, so
17 they can just point because ... they want to say something and maybe the right
18 words are not coming out... that also helps. (RehabN3)
19

20 **Speech pathology support and education facilitates staff's use of communication** 21 **promoting strategies**

22 Staff reported support and education from speech pathology staff facilitated their
23 ability to interact successfully with patients with aphasia.
24

25 I had a patient who had word finding difficulties... I just was observing the speechie
26 [speech pathologist], she would just be like "no, what do you mean?" and he'll be
27 like [pointing] and she'll be like "tell me what's the word"... it's something I could
28 have just added to my session. (PT4)
29

30 **Staff knowledge and utilisation of communication strategies promotes communication** 31 **activities**

32 Staff and volunteers discussed the use of communication strategies and resources to
33 facilitate communication on the ward for patients with a variety of communication
34 impairments.
35

36 We use communication boards, pictures, writing things down, talking slowly.
37

38 (MedC2)

39 If they are having trouble, I will say to them "it's okay you don't need to hurry, that's
40 fine". (V1)
41

42 **Individual staff factors promote communication opportunities for patients**

1
2
3 Staff and patients talked about how individual characteristics of staff, including
4 rapport building and being friendly, facilitated communication for patients with
5 communication difficulties.
6
7

8 Sometimes they [patients] look for that specific person... the more they get
9 confident, the more they get relaxed, the more their speech enhances as well.
10
11
12 (RehabN3)
13
14
15

16 Discussion

17 This study aimed to explore hospital staff, volunteers and patients' perceptions of
18 barriers and facilitators to communication on an acute and a rehabilitation ward. A wide
19 range of factors were perceived to act as potential barriers or facilitators to communication.
20 Additionally, a number of factors influencing patient access to communication opportunities
21 appeared to influence one another.
22
23
24
25
26

27 The co-location of patients in therapy spaces, dining areas or in shared rooms were
28 perceived as facilitators to communication for patients, providing opportunities for
29 incidental social interactions with other patients and their visitors. However, background
30 noise in these shared spaces was also perceived to act as a barrier to their ability to engage
31 in communication. Patient access to communal spaces was influenced by a number of
32 factors including patients' sense of autonomy to freely explore the hospital ward
33 environment, and their medical and mobility status, and staff's perception of their available
34 time, which influenced staff's perception of whether they transferred patients to these
35 spaces. Rosbergen et al¹⁷ reported that in an acute stroke ward enriched environment
36 communal mealtimes and group activities were perceived to facilitate social activity. The
37 study by Rosbergen et al¹⁷ found that staff reported perceptions that shared rooms limited
38 staff and patients' ability to engage in private conversations, consistent with O'Halloran et
39 al's¹⁸ findings. It may be that access to both private and communal spaces available within
40 the hospital environment play critical roles in regards to providing opportunities for social
41 interactions with other patients and their visitors and opportunities for privacy when
42 required.
43
44
45
46
47
48
49
50
51
52
53
54
55

56 The acute and rehabilitation wards had a large proportion of single rooms, which
57 could have been considered the result of this study being conducted at a private hospital.
58 However, there has been a perceived trend towards increased proportions of single rooms
59
60

1
2
3 in newly built public hospitals to promote infection control and patient privacy which may
4 have a detrimental effect on communication.^{19,20} The predominance of single rooms and
5 limited opportunities to access shared spaces may have increased the effect of other
6 barriers on communication opportunities for patients. For example, a patient with poor
7 autonomy may be more likely to remain alone in their single room when they are not
8 attending therapy, as they perceive they are not 'allowed' to freely explore the hospital
9 environment. This may reduce the likelihood of the individual independently seeking out
10 social interactions beyond their room. If they also have reduced mobility, they may be more
11 reliant on staff to facilitate transfers to communal spaces which may be impacted by staff
12 time constraints. The patient's functional status and levels of fatigue may also limit their
13 ability to initiate and engage in activities while they are in their room. Therefore, the
14 combined effect of these barriers may significantly limit this patient's communication
15 opportunities.

54
55
56
57
58
59
60
These communication barriers may be mitigated by having scheduled rest periods,
and periods allocated to encouraging visitors to provide opportunities for communication
and socialisation within their room, and facilitate patient access to shared spaces, such as
helping mobilise wheelchair users into communal dining areas or education to patients that
they are allowed to explore the hospital ward environment. Rosbergen et al¹⁷ identified
patient and family autonomy to initiate and direct activity as a factor enriching the acute
ward environment. Therefore, increasing patient autonomy within this setting may facilitate
their ability to seek out interactions within the environment and increase engagement in
communication activity, which may then reduce the effect of being in a single room with
reduced mobility and time poor staff.

A potential lack of opportunities to access social interactions with other patients
means staff, including volunteers, and visitors may become the main communication
partner for patients. Godecke et al's⁵ observation study found that nurses are the most
frequent communication partner for patients following stroke with aphasia, after their
family members, therefore patient-staff interactions may play a significant role for those
patients with minimal or no visitors. It is interesting to note that this study recruited a
limited number of acute nurses in comparison to rehabilitation nurses. This could be
interpreted as a reflection of differences in nurses' capacity for additional activities within
the demands and time restrictions of the acute ward context in comparison to the

1
2
3 rehabilitation ward context. Within the current study, communication between staff and
4 patients appeared to be dependent on a number of factors including staff perception of
5 their role, their knowledge and skills in facilitating communication, their values and
6 attitudes towards communication and whether supporting language and communication for
7 patients with aphasia is part of their 'role', their willingness to be flexible with their time,
8 and their knowledge of and access to resources which may be used to facilitate
9 communication. This also highlights the potential impact of the perceived power imbalance
10 between staff and patients and the significance of interactions that are task directed. Hersh
11 et al²¹ reported patients with aphasia felt disempowered in communicative interactions
12 with nurses, where nurses tended to talk to the task and controlled the interactions. This
13 highlights the need for communication partner training which may provide staff with the
14 knowledge and skills required to support effective communication with patients with
15 aphasia.²² Implementation strategies will need to be considered to promote behaviour
16 change as well as the uptake and maintenance of training including involvement of
17 management and ward champions, and ensuring trained communication strategies are easy
18 to learn, apply and audit in order to be applicable in this busy context.²³

19

22
23
24
25
26
27
28
29
30
31
32
33 Time pressure was perceived as a major barrier to communication impacting on
34 staff's ability to support successful communication within their interactions with patients,
35 and facilitate patients' opportunities to engage in interactions in social or communal areas.
36 Time constraints have been reported to limit communicative opportunities between
37 patients following stroke and nurses.²⁴ Ball et al²⁴ found that 86% of surveyed nurses
38 reported one or more activities had been "left undone" in their last shift as a result of lack
39 of time. The study found that activities most likely to be missed by nurses as a result of time
40 constraints were comforting and talking to patients (66%) and patient education (52%).²⁴
41 This has also been identified by patients who "did not like to bother the busy nurse".²⁵ Time
42 limitations and pressures on the wards may be facilitated by developing staff knowledge of
43 and skills in using communication promoting strategies. Effective and efficient nurse patient
44 communication as a result of nurse training has been found to save time, reduce frustration
45 and reduce the burden associated with caring for patients following stroke with aphasia.²⁶
46 Additionally, time limitations reported by staff may lend to an argument for additional
47 nursing allocation for patients with communication impairments.
48

51
52
53
54
55
56
57
58
59
60

1
2
3 This study included a small number of medical and nursing staff in comparison to
4 compared to allied health staff which may be reflected in the reported results. This study
5 also involved a small number of patients and a broader range of perspectives may have
6 been expressed with a larger number of participants. The results of this study may reflect
7 the context of a private metropolitan hospital therefore further exploration of patient and
8 staff perspectives in the public sector may be warranted.
9
10
11
12
13

14 **Conclusions**

16 The barriers and facilitators to communication appear to be interconnected and
17 likely to influence one another, suggesting that the level of communication access may vary
18 from patient to patient within the same setting. Results of this study highlight a number of
19 practical changes that could be implemented to promote communication opportunities for
20 patients admitted to hospital early after stroke. However, implementation of behaviour and
21 cultural change strategies may be pertinent to promote meaningful and sustainable change
22 within the hospital setting. Consideration of areas for co-location for patients such as
23 therapy spaces, dining areas or shared rooms as well as access to private spaces may
24 potentially address the need for social opportunities with other patients as well as access to
25 privacy when required. The promotion of visitors attending the wards may facilitate
26 communication opportunities for patients between therapy times by providing socialisation
27 in patients' rooms as well as facilitating and advocating for patient access to communal
28 areas. This has the potential to mitigate the effect of social isolation in single rooms, staff
29 time restraints and limitations as a result of patients' medical status. Strategies to promote
30 patient autonomy in hospital may promote their ability to freely explore the environment
31 beyond their room may help address the power imbalance that can occur between patients
32 and hospital staff. Additionally, health staff and volunteer education in using
33 communication promoting strategies may increase opportunities for interactions between
34 patients, and staff or volunteers and promote communication exchange within those
35 interactions. These factors will be explored in a Communication Enhanced Environment,
36 which aims to increase patients' opportunities to engage in language activities during early
37 stroke recovery in hospital.

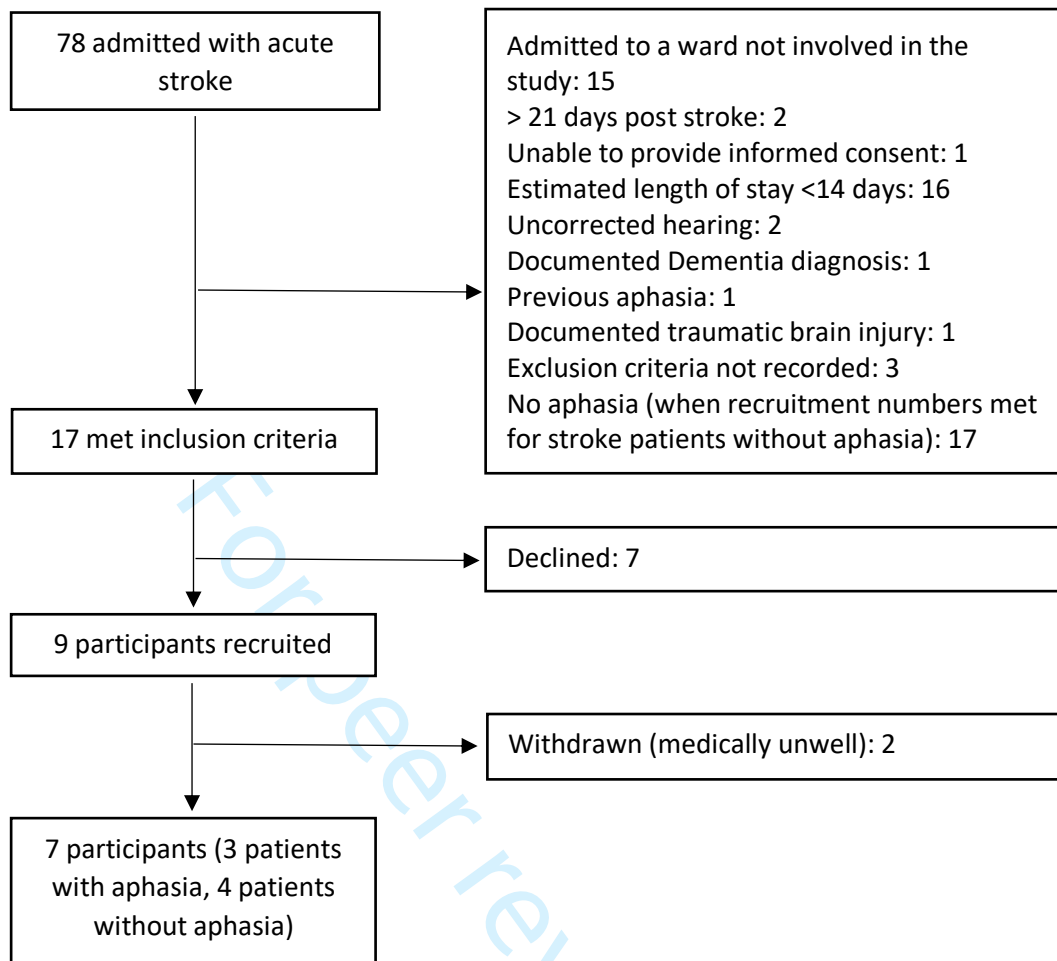

Figure 1. Summary of patient screening and recruitment

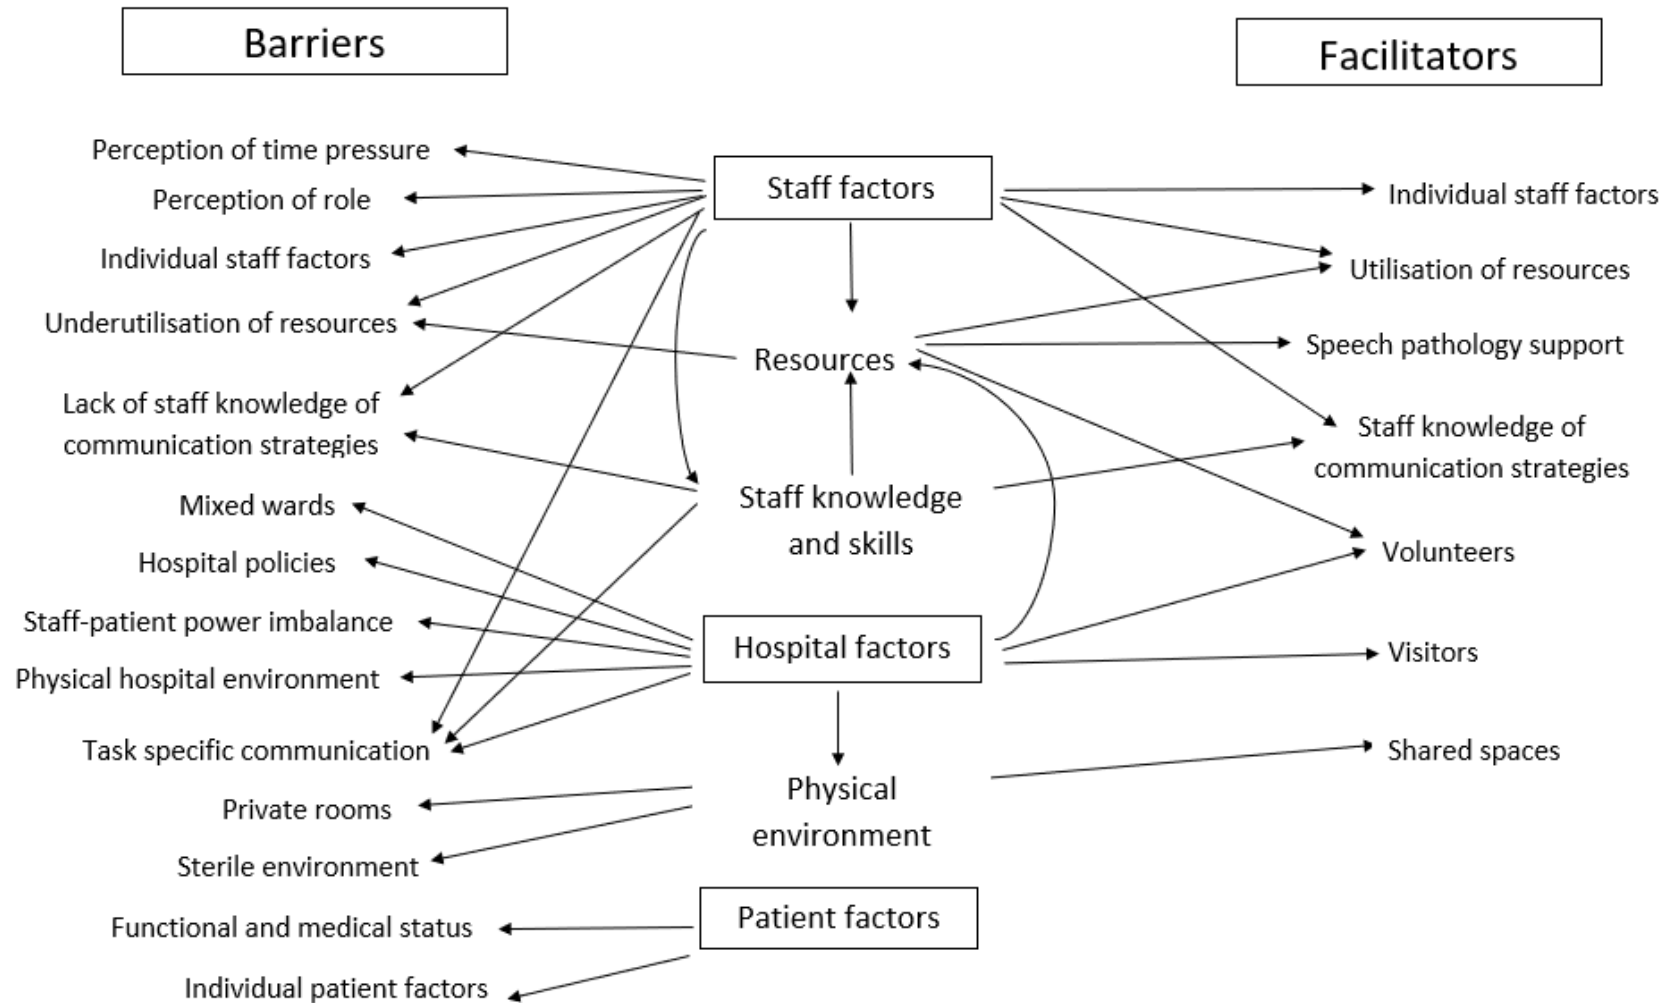

Figure 2. Summary of themes and subthemes of staff and patient perceptions to barriers and facilitators to patient following stroke.

Appendix A.**Investigating Communication Enhanced Environments after stroke: Staff focus group guide**

What kind of language activities or language tasks do stroke patients currently participate in on the ward?

What kind of language activities or language tasks would you like see stroke patients have access to on the wards?

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about anything that facilitates your ability to communicate with stroke patients on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

What changes would you like to see to enhance communication between staff and stroke patients on the ward?

What changes would you like to see to enhance communication between visitors and stroke patients on the ward?

How could we enhance or optimise communication and language tasks and activities for stroke patients on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

Appendix B.**Investigating Communication Enhanced Environments after stroke: Patient interview guide**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

Appendix C.

Consolidated criteria for reporting qualitative studies (COREQ): 32-item checklist

No Item	Guide questions/description	Location within paper
Domain 1: Research team and reflexivity		
Personal Characteristics		
1. Interviewer/facilitator	Which author/s conducted the interview or focus group?	Page 10
2. Credentials	What were the researcher's credentials? E.g. PhD, MD	Page 10
3. Occupation	What was their occupation at the time of the study?	Page 10
4. Gender	Was the researcher male or female?	Page 10
5. Experience and training	What experience or training did the researcher have?	Page 10
Relationship with participants		
6. Relationship established	Was a relationship established prior to study commencement?	Page 7
7. Participant knowledge of the interviewer	What did the participants know about the researcher? e.g. personal goals, reasons for doing the research	Supplementary files, participant information and consent forms, page 10
8. Interviewer characteristics	What characteristics were reported about the interviewer/facilitator? e.g. Bias, assumptions, reasons and interests in the research topic	Page 10
Domain 2: study design		
Theoretical framework		

9. Methodological orientation and Theory	What methodological orientation was stated to underpin the study? e.g. grounded theory, discourse analysis, ethnography, phenomenology, content analysis	Page 13
Participant selection		
10. Sampling	How were participants selected? e.g. purposive, convenience, consecutive, snowball	Page 8, 10
11. Method of approach	How were participants approached? e.g. face-to-face, telephone, mail, email	Page 8, 10
12. Sample size	How many participants were in the study?	Page 8, 10
13. Non-participation	How many people refused to participate or dropped out? Reasons?	Figure 1, page 8
14. Setting	Setting of data collection Where was the data collected? e.g. home, clinic, workplace	Page 7-8
15. Presence of non-participants	Was anyone else present besides the participants and researchers?	Page 11
16. Description of sample	What are the important characteristics of the sample? e.g. demographic data, date	Table 2, page 12
Data collection		
17. Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	Appendix A, Appendix B
18. Repeat interviews	Were repeat interviews carried out? If yes, how many?	NA
19. Audio/visual recording	Did the research use audio or visual recording to collect the data?	Page 10
20. Field notes	Were field notes made during and/or after the interview or focus group?	Page 10
21. Duration	What was the duration of the interviews or focus group?	Page 11

22. Data saturation	Was data saturation discussed?	Page 5
23. Transcripts returned	Were transcripts returned to participants for comment and/or correction?	No
Domain 3: analysis and findings		
Data analysis		
24. Number of data coders	How many data coders coded the data?	Page 13
25. Description of the coding tree	Did authors provide a description of the coding tree?	Figure 2
26. Derivation of themes	Were themes identified in advance or derived from the data?	Page 13
27. Software	What software, if applicable, was used to manage the data?	Page 13
28. Participant checking	Did participants provide feedback on the findings?	Page 13
Reporting		
29. Quotations presented	Were participant quotations presented to illustrate the themes / findings? Was each quotation identified? e.g. participant number	Page 14-20
30. Data and findings consistent	Was there consistency between the data presented and the findings?	Page 14-20
31. Clarity of major themes	Were major themes clearly presented in the findings?	Figure 2
32. Clarity of minor themes	Is there a description of diverse cases or discussion of minor themes?	Page 14-20

1 Abbreviations and Definitions of Terms

CEE model: Communication Enhanced Environment model, an adapted model of an Enriched Environment, an environment that provides stroke patients opportunities to engage in language activities during inpatient rehabilitation.

PWA: Patients following stroke with aphasia.

PWOA: Patients following stroke without aphasia.

Language activities: Language tasks that consist of solitary or interactive language activities.

Solitary language activities: Activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications.

Interactive language activities: activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

EE: Enriched Environment, an environment that promotes physical, cognitive and social activity.

2. Protocol Synopsis

<p>Study Title:</p>	<p>Investigating a Communication Enhanced Environment model on acute and rehabilitation wards early after stroke: A before-after non-randomised controlled pilot study</p>
<p>Study type:</p>	<p>Interventional</p>
<p>Study Intervention:</p>	<p>A Communication Enhanced Environment (CEE) model will be developed from pre-intervention observations of inpatient language activities and investigations of barriers and facilitators to communication together through focus groups with hospital staff and interviews with patients on the acute and rehabilitation wards.</p> <p>Sixteen patients following stroke will be recruited in this prospective before-after non-randomised controlled pilot study set in an acute and a rehabilitation ward of a metropolitan private hospital. The study includes: i) The baseline phase which involves observation of patients following stroke (n=8, 4 patients with aphasia (PWA) and 4 patients without aphasia (PWOA)); the collection of qualitative data through focus groups and semi-structured interviews to determine patient and staff perceived barriers and facilitators to communication; ii) the implementation phase where a CEE model will be developed and embedded in usual care; iii) the post-implementation phase which will involve repeated baseline data collection on a different cohort of patients (n=8, 4 PWA and 4 PWOA) to determine i) how solitary and interactive language activity levels changed following implementation of the CEE model, ii) the differences post CEE implementation in hospital staff's use of communication promoting strategies when interacting with patients, iii) the differences post CEE implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>The CEE model will include the provision of:</p> <p>i) CEE model equipment, for example reading materials such as books and magazines, and access and encouragement to reside in a communal dining area;</p> <p>ii) CEE model education, support and training for staff with the aim to develop the ability to facilitate language activities for patients after stroke. The training program will be guided by research evidence, expert opinion and baseline data. Staff will complete a questionnaire pre and post training to determine changes in their knowledge, skills and attitudes regarding communication and aphasia.</p> <p>Control treatment: Patients following stroke with and without aphasia will be observed and video recorded over two week days and one weekend day pre (n=8) and post (n=8) implementation of a CEE model. Behavioural mapping will record patient interactive and solitary language activity observed within the first minute of 5-minute intervals in 4-hour time periods between 7am and 7pm. <i>Solitary language activities</i> are activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications. <i>Interactive language activities</i> are activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.</p>

<p>Objectives of the Study:</p>	<p>This study aims to investigate a CEE model on an acute and rehabilitation ward and if stakeholders perceive a CEE model as valuable by addressing the following research questions:</p> <ul style="list-style-type: none"> - Does a CEE model increase the amount of time PWA and PWOA spend in participating in solitary and interactive language activities on acute and rehabilitation wards during the early post-stroke period? - What are the differences in patients' experience of communication in a CEE model compared to patients' experience of communication in a standard environment on in-patient acute and rehabilitation wards? - What is the experience of implementing a CEE model for staff working with PWA and PWOA within in-patient acute and rehabilitation wards? - Do staffs' perceptions of their knowledge of, skills with, and attitude towards communication and aphasia change following implementation of a CEE model?
<p>Number of Centres:</p>	<p>1</p>
<p>Study duration:</p>	<p>5 years</p>
<p>Study Hypothesis:</p>	<p>A CEE model will increase patient engagement in solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.</p>
<p>Primary outcomes:</p>	<p>The primary outcome is the change in the proportion of solitary and interactive language activities as a percentage of total observed activity after the implementation of the CEE model.</p> <p>Timepoint: Patient observations completed within 21 days post stroke.</p>
<p>Secondary outcomes:</p>	<p>The differences post CEE model implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>Timepoint: Within 18 months of embedding the CEE model.</p>
<p>Study design:</p>	<p>Before-after non-randomised pilot study</p>
<p>Key inclusion criteria:</p>	<p>Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a stroke, less than 21 days post stroke during baseline phase or post-implementation phase, the ability to provide informed consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening, an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below 93.7 on the Western Aphasia Battery-Revised.²</p> <p>Staff participants: One representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.</p>
<p>Key exclusion criteria:</p>	<p>Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at the time of acute admission or are a participant in another research trial which may affect this study's outcome measures.</p>
<p>Study Procedures:</p>	<p>Baseline phase: Eligible patients during the baseline phase will be observed and video recorded for 4 hours on 3 consecutive days (one weekend and two weekdays) and will complete a semi-structured interview to explore their experiences of communication, and their perceptions of barriers and facilitators to inpatient language activities during their inpatient admission.</p>

	<p>Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to inpatient language activities. A focus group interview schedule will be used across all focus groups.</p> <p>Implementation phase: The CEE model will be implemented within the acute and rehabilitation wards.</p> <p>Post-implementation phase: Intervention group patient observations and interviews, and staff focus groups will replicate baseline data collection.</p>
Safety parameters	<p>Patients and/or their significant others may experience increased levels of distress during recruitment and/or data collection. This may be the result of adjustment following stroke and/or diagnosis of aphasia and increased awareness of impairment. No other risks known regarding participation in this project. The baseline assessments and interview will be conducted by the Chief Investigator who has experience in supporting patients during this early stage of stroke recovery. If a patient or any significant others becomes upset or distressed, the assessment or interview will be paused with the option to discontinue and counselling strategies will be provided.</p>
Statistical methods /analysis	<p>Patient demographic and stroke characteristics will be presented using descriptive statistics. One-way ANOVA or the Kruskal-Wallis and chi-square tests will examine differences in characteristics between groups. Time spent observed in interactive and solitary language activities will be expressed as a percentage of total observations. A mixed design ANOVA will be used to calculate the within-subjects variable of presence of aphasia and the between-subjects variable of a CEE on language activity levels of patients by comparing baseline to intervention phase observations. A qualitative description research approach will be used for the qualitative component of this research. The mixed methods design will enable the triangulation of the qualitative and quantitative data.</p>
Sample size determination:	<p>The patient sample size was selected for this pilot study to collect data across each observation period for each patient group in the baseline and intervention phases (see document: Observation_protocol_SD_version 3_23-02-16). The sample size for staff participants was selected to capture a sufficient breadth of professional perspectives.</p>

3. Introduction

Aphasia is an acquired communication disorder that affects approximately 30% of first ever ischaemic stroke survivors³ and persists in up to 61% of survivors one-year post stroke.⁴ Aphasia impacts all communication modalities with significant negative consequences for social participation, interpersonal relationships, autonomy, capacity to work and quality of life.⁵

Patients following stroke with aphasia (PWA) have been observed to spend less than 28% of their day communicating and 44% of their day alone during their first weeks of inpatient rehabilitation.⁶ Inadequate opportunities for communication places PWA at risk of developing maladaptive behaviours such as learned non-use of language.⁷

Environmental Enrichment (EE) refers to conditions which promote physical, cognitive and social activity and has been shown in animal models of stroke to enhance neuroplasticity⁸, promote better learning and memory and contribute to significant improvements in motor function.⁹ The human equivalent model¹⁰ in a rehabilitation unit results in patients spending more time engaged in activity and less time sleeping and alone.¹¹

4. Objectives

Aphasia is a complex language impairment and PWA may need additional support within an Enriched Environment. This pilot study seeks to develop and test an adapted model of an Enriched Environment, a Communication Enhanced Environment (CEE), as a strategy to provide PWA and patients following stroke without aphasia (PWOA) more opportunities to engage in language activities during inpatient rehabilitation. Within this study language activities include both *solitary activities* that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications, and *interactive activities* which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

4.1 Hypotheses

A CEE will increase patient solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.

5. Study design

This mixed methods pilot study is a prospective before-after non-randomised controlled design in an acute and a rehabilitation ward of a metropolitan private hospital. The study involves three phases:

- i) *Baseline*: observe and quantify the current ward environment;
- ii) *Implementation* of the CEE model;
- iii) *Post-implementation*: assess the impact of the CEE model.

6. Study Population

- i) *Patients*: The baseline group (n=8, 4 PWA, 4 PWOA) recruited within the baseline phase, and the intervention group (n=8, 4 PWA, 4 PWOA) recruited during the post-implementation phase.

- 1 ii) *Staff participants*: One representative from each acute and rehabilitation staff group including medical,
2 nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.

3 **6.1 inclusion and exclusion criteria**

4 Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a
5 stroke, less than 21 days post stroke during baseline phase or intervention phase, the ability to provide informed
6 consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening,
7 an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-
8 structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below
9 93.7 on the Western Aphasia Battery-Revised.²

10 Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented
11 diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at
12 the time of acute admission or are a participant in another research trial which may affect any of this study's
13 outcome measures.

14 Staff and volunteers who are over 18 years old will be eligible to participate in this study.

15 **7. Study Assessments and Procedures**

16 **Baseline**

17 All recruited patients will complete the Montreal Cognitive Assessment,¹¹ and The NIH Stroke Scale.¹² PWA
18 will also complete the Western Aphasia Battery-Revised.² Patients' behaviour will be observed and video recorded
19 for four hours per day on a Sunday, Monday and Tuesday between 7am to 7pm. A behaviour mapping tool
20 (Appendix A) developed for this study will record patient engagement in language activities in the first minute of
21 each five-minute interval across each four-hour observation period. Semi-structured interviews will explore patients'
22 perceptions of barriers and facilitators to inpatient language activities. An interview schedule will be used across all
23 interviews (Appendix B.). Supportive communication strategies will be used to facilitate PWA participation in
24 interviews with transcriptions annotated to capture any non-verbal responses.

25 Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to
26 inpatient language activities. A focus group/interview schedule (Appendix C.) will be used across all focus groups.

27 **Implementation**

28 The CEE model will be implemented within the acute and rehabilitation wards.

29 **Post implementation**

30 Intervention group patient observations and interviews, and staff focus groups will replicate baseline data
31 collection.

32 **8. Study Treatment**

33 The CEE model incorporates the following strategies to encourage engagement in language activities:

- 34 i) Staff training to facilitate patients' communication and provide opportunities to engage in language
35 activities;
- 36 ii) Patient access to:

- a) Communication enhancement resources such as iPads and audiobooks;
- b) Communal areas to facilitate engagement amongst patients.

9. Participant Completion and Discontinuation

9.1 Participant Completion

Participants will have completed the study when they have completed the semi-structured interview.

9.2 Participant withdrawal

Participation in this study is voluntary. The participant can withdraw from taking part in the study at any time without giving a reason for withdrawing.

10. Data analysis

10.1 Primary Analysis

The proportion of observed episodes where PWA and PWOA are engaged in language activities at baseline and post implementation will be analysed using a mixed design ANOVA.

10.2 Secondary Analysis

The differences in staff and patient perceptions of the barriers and facilitators to inpatient language activities and communication post CEE implementation will be analysed through a qualitative description approach. Triangulation of the qualitative and quantitative data will be conducted.

11. Data management

The data collected will be confidential. No identifying information will be attached to the data and any information that may reveal participant's identity will be removed. The master list of participant names and codes will be kept in a locked filing cabinet at the hospital site which will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The de-identified data will be stored on a password-controlled computer and/or in a locked cabinet at Edith Cowan University. Electronic data will be backed up on a password controlled hard drive only accessible by the Chief Investigator.

The data collected from this study will have a significant contribution to the aphasia research area and therefore will be stored for 15 years following the completion of this study. Data may be accessed for future studies by the study investigators or higher degrees by research (HDR). In the case of HDR use of the data, the use of the data will be bound by a two-way confidentiality agreement. The data may be used for teaching purposes only with the additional written permission from participants. The data may be made accessible to consumer groups (for example the Australian Aphasia Association) and information may be made available through the National Stroke Foundation and scientific journals. Confidentiality will be maintained in all circumstances. Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data are only used for approved purposes. Researchers who access this data from the data bank will not have access to the participant keys that attach participants to codes therefore data will only be re-identifiable by the Chief Investigator. Data will be deleted from electronic storage and hard copy data will be shredded by the chief

investigator after 15 years completion of the research study (with Ethics Committee approval, Ethics approval numbers: HPH431 and ECU HREC 12149). Non-identifiable data will be added to data archives for data sharing. Researchers who access data archives will not have access to information attaching participants to coded data.

12. Study Report

This study will be published in a PhD thesis as part of the Chief Investigator's Higher Research Degree. Outcomes from this study will be published in peer review journals and at conferences.

13. Administration Procedures

13.1 Ethical Considerations

This research is likely to have a significant impact on aphasia recovery following stroke and will form the basis for future study designs. This study will develop a teaching and learning package that can be used in the future to facilitate and promote increased levels of communication activity during early stroke recovery. The implementation of a CEE may address missed opportunities for language stimulation, harness increased levels of neuroplasticity and optimise aphasia language recovery after stroke. The benefit of a CEE may extend beyond patients with aphasia and may improve health care experience and communication access for all patients following stroke. Additionally, these benefits may extend beyond patients involved in the study as trained staff may use skills and knowledge obtained in the training program to enhance the communication environment of all patients they care for.

13.2 Ethical Review Committee

All processes and documentation used within this study will be reviewed and approved by the Edith Cowan University Research Ethics Committee and the site Ethics Committee. The Chief Investigator will complete the annual ethics reports and will be responsible for reporting any adverse events to the Ethics Committees.

13.3 Informed Consent

Participants will be excluded if they do not have adequate English proficiency to participate in semi-structured interviews and focus groups. Any participants that require an interpreter will be excluded from inclusion in this study as determined by the medical team.

Patients with aphasia will be provided with aphasia friendly information sheets and consent forms with simple language, bold key words and pictorial support. This will be read and explained by the researcher. Supported conversation strategies will be used to support and facilitate patients with aphasia's involvement and understanding of the research process, informed consent and their rights to withdraw at any time. This will be provided by the Chief Investigator who is a qualified speech pathologist with experience in communicating with patients with aphasia using supported conversation techniques to facilitate and support communication. A detailed information will also be provided to the 'person responsible' for all patients.

13.4 Protocol Amendments

All protocol amendments will be reviewed and accepted by the Edith Cowan University Research Ethics Committee and the site research Ethics Committee.

Appendix B. Patient interview guide

Investigating Communication Enhanced Environments after stroke**Patient Interview guide, version 1_11-8-15**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

For peer review only

Appendix C. Staff focus group guide.

Investigating Communication Enhanced Environments after stroke
Staff focus group guide, version 1_27-7-15

STAFF FOCUS GROUP GUIDE BASELINE PHASE

What kind of language activities or language tasks do stroke patients currently participate in on the ward?

What kind of language activities or language tasks would you like see stroke patients have access to on the wards?

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about anything that facilitates your ability to communicate with stroke patients on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

What changes would you like to see to enhance communication between staff and stroke patients on the ward?

What changes would you like to see to enhance communication between visitors and stroke patients on the ward?

How could we enhance or optimise communication and language tasks and activities for stroke patients on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

STAFF FOCUS GROUP GUIDE POST-IMPLEMENTATION PHASE

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

Describe the differences in the communication environment since implementing the model.

What changes did you see to enhance communication between staff and stroke patients on the ward?

What changes did you see to enhance communication between visitors and stroke patients on the ward?

What was it like to use the model?

How do you feel about the model?

Can you tell me about anything that helped you use the model with stroke patients on the ward?

Can you tell me about any barriers you experienced while implementing the model?

How can we improve the model?

Communication Enhanced Environments after Stroke

Study procedure version 2_23-02-16

BASELINE:

Staff recruitment: The Chief Investigator will recruit staff participants through a verbal explanation of the study and the provision of the information sheets and written consent forms. Staff will be provided 48 hours to discuss the study and ask questions before consenting to participate. Staff interviews and focus groups will commence as staff participants are recruited. Staff will participate in a one-hour focus group or a one-hour semi-structured interview (in person or via telephone) to explore staff perceptions of environmental barriers and facilitators to language activity and communication on in-patient acute and rehabilitation wards.

Patient recruitment: All consecutively admitted patients following stroke during the baseline period will be screened for eligibility to participate in the study. The hospital site investigators will identify potential stroke participants that meet the inclusion and exclusion criteria. Stroke participants with aphasia will be identified by the hospital speech pathology or medical team as having a diagnosis of aphasia (aphasia diagnosis will be confirmed via Western Aphasia Battery-Revised (WAB-R)¹ Aphasia Quotient score <93.7 during data collection). The site investigators will approach potential participants and gain verbal consent from the patient to be approached by a member of the research team and have their 3-point identification released to the research team. This will be documented in the patient's integrated medical progress notes. Once verbal consent has been gained and documented, the site investigators will email the Chief Investigator the patient alert proforma identifying the patient as meeting the inclusion/exclusion criteria. The research team will liaise with the medical team to confirm the potential stroke participant meets the inclusion criteria: (i) admitted to the in-patient rehabilitation stroke unit for recent stroke, (ii) are less than 21 days post stroke and during baseline phase or intervention phase, (iii) have the ability to provide informed consent as determined by the medical team iv) Glasgow Coma Scale² greater than 10 at the time of screening, (v) have an estimated length of stay greater than 14 days and (vi) have adequate English proficiency to participate in semi-structured interviews. Patients will be excluded if they (i) have uncorrected hearing or vision (for example hearing impairment without hearing aids, vision impairment without glasses), (ii) are not medically stable, (iii) have a documented diagnosis of major depression or (iv) have a documented history of dementia or significant cognitive decline, traumatic brain injury or previous aphasia at the time of admission for the acute event, (v) or are a participant in a research study that will influence this study's outcomes. Stroke participant recruitment will follow the stroke participant consent procedure (see document: SD_Communication Enhanced Environments after Stroke consent procedure version 1_3-2-15). A record of identifying participant details attached to patient codes will be kept at the hospital site in a locked filing cabinet. An email summary of the baseline assessment results will be sent to the hospital speech pathology generic email address. The patient will be identified by patient code and ward/room number. The hospital speech pathology team will write a summary of the assessment results in the patient's integrated medical progress notes.

Patient data collection: All recruited stroke participants will complete the NIH Stroke Scale³ (by someone trained in using this tool) and the Montreal Cognitive Assessment (MoCA).⁴ Participants with aphasia will also complete an assessment of aphasia, the WAB-R¹ and provide a personal narrative language sample on their reason for admission to confirm a diagnosis of aphasia. After patient recruitment has been completed, the Chief Investigator and/or trained medical team members will recruit the patient's family, friends and significant others to consent to video recording and observations of their interactions with stroke participants.

Observations of stroke participants will commence 1-3 days after obtaining written consent. Patients' behaviour will be observed by the Chief Investigator or a Research Assistant, and video recorded for a total of 12 hours to enable behaviour mapping of video data (see document: Observation_protocol_SD_version 3_23-02-16). Patients will be observed and video recorded for 4 hours per day on weekend day and two consecutive weekdays between 7am to 7pm. The observation periods will be grouped into 4-hour observation intervals (e.g. 7am-11am, 11am-3pm and 3pm-7pm). Each day the patient will be observed and video recorded for one observation interval. The participant will be observed and video recorded during a different observation interval each day to gain a general insight into the patients' activities (see Figure 1. below). Patients who do not consent to video recording will be provided with the option of audio recording and manual observation conducted by the researcher to enable the collection of case notes regarding patient behaviour. An observational protocol developed for this study will be used to measure the frequency stroke participants engage in language activities. These will be categorised into *solitary language activities* for example reading, writing, listening to the radio, use of iPad applications, and *interactive language activities* defined as i) an interaction involving an exchange of information, ii) with a communication partner including gesture and/or facial expression, reading, writing or drawing for the purpose of communication and use of technology including talking on the telephone. The observational protocol will be based on the behavioural mapping techniques of Janssen et al.⁵ Patients' solitary and interactive language activities will be recorded in 5-minute intervals and activity observed within the first minute of the observation interval will be recorded on a checklist of the predetermined behaviours. Semi-structured supported conversation interviews for stroke participants will be conducted within 5 days of the last observation. The interviews will explore patients' perceptions of environmental barriers and facilitators to language activities and communication and their experience of communication on the acute and rehabilitation wards.

IMPLEMENTATION:

A model of a CEE will be implemented within the acute and rehabilitation wards. The model will be developed as part of the research project. We hypothesise that our model of CEE will include the provision of:

- i) CEE equipment, for example reading materials such as books and magazines, access to a computer with internet and access to a communal dining area,
- ii) CEE education, support and training for staff, patients and their family, friends and significant others with the aim to develop the ability to support and facilitate 'language activity' and 'communication activity' for patients after stroke. This will be accessible via multiple modalities including one-on-one training and group training sessions, as

well as through the provision of video and written resources. A questionnaire will be administered pre and post training in order to determine staffs’ perceptions of changes in their knowledge, skills and attitude towards communication and aphasia. Additionally, feedback regarding the content and format of the training program will be obtained through questionnaires administered after the completion of the training program. Training and support provided in the implementation phase will be continued until the end of the intervention phase.

POST-IMPLEMENTATION:

Staff participant semi-structured interviews and focus groups will be conducted. Staff will participate in a one-hour semi-structured interview or a one-hour focus group to explore staff perceptions of environmental barriers and facilitators to language activities and communication.

The procedures for participant recruitment and data collection during the post-implementation phase will replicate those used in the baseline phase.

There is no travel commitment for all participants as all data collection and training will be conducted at the hospital.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday

Communication Enhanced Environments after Stroke consent procedure

Version 1_3-2-15

Stroke participants

The following consenting procedure will be used for all participants who are identified as potential research participants. Recruitment will only be completed by the Chief Investigator.

1. Check the stroke participant meets the inclusion criteria and exclusion criteria.
2. Read the participant information sheet to the participant. Use the pictures on the participant consent form to support the patient's comprehension of verbal information. Use gesture, written and pictorial support to facilitate verbal communication as required.
3. Provide the person responsible with the person responsible information sheet and consent form.
4. Provide time for the patient and the person responsible to discuss the study and ask questions to their satisfaction.
5. Ask the stroke participant if they consent to the study using simple closed questions (e.g. "Do you understand what the study is about?", "Do you have any questions about the study?", "Do you want to be in the study?", "Will you sign the form?"). Use multi-modal communication strategies and repeat information/questions as required. Use the pictures on the participant consent form to support patient comprehension of verbal information.
6. If the stroke patient agrees to participate in the study, ensure they sign the consent form witnessed by someone independent of the study.
7. Provide the stroke participant with a copy of the information sheet and consent form for their own records.
8. Add the participant study number to the consent form
9. Store the signed consent forms in a locked cabinet at the hospital site. This cabinet will only be accessible by the research investigators.

Investigating Communication Enhanced Environments after stroke

Observation Protocol version 3_ 23-2-16

During the baseline and intervention period, patients’ behaviour will be observed and video recorded for a total of 12 hours. Patients who do not consent to video recording will be provided with the option of audio recording and manual observation. This will enable the collection of relevant notes about factors that might influence the interactions that may not be captured in the video or behavioural mapping, for example the context of the interactions or details about the environment.

Patients will be manually observed and video recorded for four hours per day on two weekdays and one weekend day between 7am to 7pm. The observations will be grouped into three x 4-hour observation intervals (e.g. 7am-11am, 11am-3pm, 3pm-7pm). Each day the patient will be observed and video recorded for one of the 4-hour observation intervals. The 4- hour observation period will be split into 5-minute intervals. All language and communication activity observed within the first minute of the 5-minute interval will be recorded on the behavioural mapping sheet with predetermined behaviours (Appendix 1). The free smart phone app ‘Impetus’ can be used to time 1-minute observations. You can set the timer to vibrate briefly when the 1-minute observation interval begins and ends.

Observation times (see Figure 1.) will be randomly selected by drawing out of an envelope. This will be conducted by the primary investigator prior to commencing patient observations. It may not be possible to observe the patient during the planned observation time, for example as a result of scheduled testing or home visits. If this occurs, patients can be observed during the next available observation interval. Changing or modifying the observation schedule should be avoided where possible.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday
1	7am-8am	*PWA1	PWA3	PWA2
	8am-9am	**PWOA1	PWOA3	PWOA2

	5pm-6pm			
	6pm-7pm			

Figure 1. Observation schedule

*PWA: patient with aphasia

**PWOA: patient without aphasia

DISCOURSE SAMPLE

You must collect a personal narrative discourse sample for each participant at the beginning of the first observation. Once you have set up the video camera and have started recording, ask the patient “what has brought you into hospital?”. Once the patient has finished telling you their personal narrative, tell the patient you will now start the observations.

VIDEO RECORDING SET-UP

Place the video camera facing the patient approximately 1-2 metres away from them. Ensure the camera is placed in an area where it is unlikely to be moved for the duration of the observation time (for example at the end of the patient’s bed). Ensure the camera frame is capturing the patient as well as their surroundings (e.g. potential communication partners, visitors, etc). If the patient relocates, reposition the camera to ensure the patient and their surroundings remain in frame. Observe and manually record the patient’s behaviour and their environment according to the procedure for behavioural mapping.

Do not record the patient in the bathroom or shower or during any other inappropriate circumstances (this may include sensitive conversations, culturally sensitive situations or if the patient requests). If the patient indicates that they don’t want to be recorded or becomes agitated, upset or distressed, use the ‘withdrawal from observations visual resource’ (if appropriate) and ask the patient:

1. Do they want you to stop video recording?
2. Do they want to be manually observed and audio recorded instead?
If the patient responds ‘no’, ask the patient-
3. Can you come back another time to observe them?

If the patient asks you to stop recording you must cease recording immediately. The patient may allow you to continue with manual observations or come back another time to complete the observations. If the patient allows you to complete manual observations and audio recording, follow the audio-recording set-up and protocol below.

AUDIO RECORDING SET-UP AND PROTOCOL

This protocol is to be followed if the patient or their family indicate they do not want to be video recorded however agree to audio recording and manual observations. Place the cap on the video camera and continue recording in order to capture audio. If using a battery-operated audio recorder, place it on a table close to the patient (within 1 metre). Ensure the audio recorder is placed in a location where it will not be touched or moved throughout the

1 observation time. Observe and manually record the patient's behaviour and their environment according to the
2 procedure for behavioural mapping. Ensure spare batteries for the audio recorder are available if required.
3
4
5

6 **COMMUNICATION PARTNERS AND VISITORS**

7
8 Take note of all communication partners and visitors who have provided consent to video recording and/or
9 observations of their patient interactions. If someone enters the room during recording politely interrupt the
10 interaction, introduce yourself and inform the person that the patient is being video recorder recorded as a part of
11 the study the patient has agreed to participate in. Ask the visitor if they would like to go out of the room with the
12 researcher to find out about the study and the video recording. Provide a verbal explanation of the study and
13 provide the 'Visitors/communication partners' information and consent form'. Offer the visitor the option of no
14 video or manual recoding during their interaction with the patient. If the person chooses not to participate in
15 manual or video observations inform the person that any incidental recordings of them will be deleted and will not
16 be included in the study. The researcher will step out of the room for the duration of their visit.
17
18
19
20
21
22
23
24
25

26 **PROCEDURE FOR BEHAVIOURAL MAPPING**

- 27 • Position self where the patient can be clearly observed
- 28 • Remain inconspicuous as possible
- 29 • Circle ALL appropriate components on the observation schedule in regards to location, activity, people
30 present and details of language and communication observed within the first minute of each five-minute
31 interval.
- 32 • You can circle more than one key per section if required (except for location).
- 33 • If you require a toilet break, leave the camera recording while you take a break. If you miss a 1-minute
34 observation, place a line through the observation interval on the behavioural mapping sheet and write
35 'unobserved-toilet break'.
36
37
38
39
40
41
42
43
44
45

46 **TIME**

- 47 • Write the time at the beginning of the 1-minute observation interval

48 **LOCATION**

- 49 • Circle only one location
- 50 • If the patient is moving between two locations, circle the location the patient is moving towards

51 AMENITIES: Toilet, shower.

52 BEDROOM: Around the patient's room or bed. If the patient is outside of their doorway this is considered 'hall'.
53
54
55
56
57
58
59
60

1 HALL: Any hallway within the hospital ward.

2 THERAPY AREA: In an allied health therapy session, including occupational therapy, physiotherapy, speech
3 pathology, nursing.

4 FAMILY MEETING ROOM: Family meeting room.

5 DOCTOR'S ROOM: Doctor's office.

6 DINING ROOM: Dining room during meal times or any other time.

7 COMMUNAL AREA: Communal dining area.

8 OUTSIDE: Outside areas including the garden, car park.

9 OFF UNIT: Off-site locations, home visits, testing off site.

10 OTHER: Anything that doesn't fit into the above categories-provide description of location.

11 PEOPLE PRESENT

12 People present include any person that is near the patient and is able to have an interaction with the patient. If you
13 do not know how to classify the person make a note to check with staff at a later time and complete the observation
14 schedule.

15 **Exceptions:** People who are near the patient but are unable to interact with the patient, e.g. cognitive or behavioural
16 issues, barriers between person and the patient preventing them from interacting- e.g. curtain drawn, people in the
17 way. If an interaction is occurring despite objects in the way, the communication partner is considered as a 'person
18 present'.

19 PEOPLE PRESENT: Nurse, nurse assistant, doctor, physio (physiotherapist), OT (occupational therapist), SP (speech
20 pathologist), DT (dietician), SW (social worker), family/friend, other patient, alone (no-one present that is conducive
21 to interactions), other (describe).

22 ACTIVITIES

23 UNOBSERVED: If you are unable to observe the patient. Place a line through the observation
24 interval and write unobserved.

25 NO LANGUAGE ACTIVITY: If the patient is observed not engaged in any communication activity.

- 26 • Circle 'no activity' on the checklist
- 27 • Write what the patient is doing, e.g. 'sleeping'

28 INTERACTIVE LANGUAGE ACTIVITIES: Defined as an interaction involving an immediate communicative exchange
29 with a communication partner. Interactive language activities may include talking, gesture and/or facial expression,
30 reading, writing or drawing for the purpose of communication, use of communication aids or AAC devices and use of
31 technology including talking on the telephone. Non-verbal gesture or facial expression includes eye contact to

1 initiate interactions, hand gestures (e.g. waving, thumbs up), body movements for the purpose of conveying a
2 communicative message (e.g. shrugging) and/or facial expressions for the purpose of communication.

3 Communication aids or AAC devices includes any use of alternative and augmentative devices for the purpose of
4 communication, e.g. high-tech or low-tech AAC devices such as letter boards, pictures/photos, whiteboard, writing
5 or drawing, smart phones, iPad. Please describe communication aids observed.
6
7

8
9 OTHER FUNCTIONAL COMMUNICATION ACTIVITIES: All other communication activities that do not involve a direct
10 immediate communicative exchange with a communication partner. Functional communication activity may include
11 reading, typing/writing, emailing, internet use, watching TV, listening to talking on the radio. Note the patient must
12 be looking directly at the TV to be considered 'watching TV'. If the TV is on in the background, do not include this as
13 'watching TV'.
14
15

16
17 NON-FUNCTIONAL/NON-PROPOSITIONAL LANGUAGE ACTIVITIES: Singing, word games (carried out alone), language
18 apps (used alone), copying written letters, words or sentences (carried out alone).
19
20

21 OTHER: Communication or language activities that do not fit the criteria of interactive language activity, 'other'
22 functional communication activities, non-functional/non-propositional language activities or may be a confounding
23 variable (for example, talking to self and talking to the observer). If a patient is talking to themselves, note if this is
24 appropriate (for example, saying 'excuse me' after burping) or inappropriate (for example, an extensive monologue)
25 and describe the context. If the patient's verbal output is inaudible, write this is in the space underneath 'talking to
26 self'.
27
28
29
30
31

32 **Note:** If the patient is using a computer, phone, smart device, or iPad where the activity they are engaged in (e.g.
33 texting, emailing, playing a game, etc) cannot be accurately determined, note this in the comments section. After the
34 1-minute observation interval has been completed ask the patient if they mind sharing if what activity they were
35 completing on their device and record this in the relevant section. If the patient does not wish to share this
36 information with you, record this in the 'other' section.
37
38
39
40

41 COMMENTS

42 Describe the context of the interactions or details about the environment in the comments section. This will provide
43 information regarding factors that may influence the interactions, for example 'background noise'. Additionally,
44 write down any information that may be missed in the video data, for example, people out of the camera frame,
45 interactions that may be overheard in the room that might impact on the current interactions.
46
47
48
49

50 Draw a line under the final comment after the one-minute observation had been completed. Write any additional
51 observations within the final 4 minutes below this line (see example).
52
53
54
55

56 If you have any queries or questions regarding this observation protocol or the observation protocol please contact
57 chief investigator Sarah D'Souza.

Stroke participant information and consent form

Communication activity in hospital

This research project is being undertaken as **part of the requirements** of a **PhD at Edith Cowan University**.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

1 You are **invited** to participate in a research project. Sarah D'Souza, a
2 speech pathologist and PhD student is leading the study as Chief
3 Investigator. This study has received ethical **approval** from **ECU** Human
4 Research **Ethics Committee** and the Hollywood Private Hospital
5 Research Ethics Committee.
6
7
8
9

10
11
12
13
14 This project is investigating the **hospital environment** to see how this
15 **influences** patient **communication activity**. Communication activity
16 involves communication, such as **talking** with other patients,
17 **socialising**, **reading** the paper, using the **telephone**, talking to staff, or
18 engaging in group activities including **therapy**.
19
20
21
22
23
24

25
26
27 **You** have been **selected** to participate as you have had a **stroke** and
28 are receiving **treatment at Hollywood Private Hospital**. We are
29 **interested** in seeing **how** the hospital **surroundings affect what you**
30 **do** throughout the day.
31
32
33
34
35

36 37 **What would you have to do?**

38
39
40 You will be **asked** to provide **consent** to **agree to participate** in the
41 study.
42
43
44

45 You will be **asked to consent** to:
46
47
48
49
50

- 51 • Complete **three tests** to see how your stroke has affected **you**
52 including your **language, concentration** and **memory**. These tests
53 will be conducted at the **beginning of the project**. The tests will take
54 approximately **1 hour** to complete with an option to complete the tests
55
56
57
58
59
60

1 over **two separate 30 minute sessions** and with as many **breaks** as
2 you may need.
3
4
5
6

- 7
- 8 • A **researcher** spending approximately **1 hour discussing with you**
9 your **opinion** regarding **how** your rehabilitation **surroundings affect**
10 **your stay in hospital** and **your communication activity** levels.
11
12
 - 13 • A researcher **video recording, observing** and **writing down** what is
14 happening in your **environment** including **your activities**. You will be
15 observed and recorded for a total of **12 hours** over **3 days**.
16
17

18
19
20
21
22
23
24
25
26 You may **not want** to be **video recorded**. If you **request**, you will
27 **not** be **video recorded**. You can ask not to be video recorded at **any**
28 **time**. In this case the researcher will **only observe, audio record**
29 and **write down** what is **happening in your** environment **including**
30 your activities.
31
32
33
34
35
36
37
38
39

- 40
- 41 • A researcher **looking at your hospital medical file** to collect
42 **information** regarding:
43
 - 44 • Your **details** (such as your age, your living arrangements, your
45 occupation and your level of functioning before your stroke)
 - 46 • Any **conditions** or **diseases** you may have
 - 47 • Information about your **stroke** (for example when it happened, the
48 **area** of the **brain** affected, how it has **affected your functioning**
49 and **abilities**)
 - 50 • Details about **how long** you have **been in hospital** since your
51 stroke
52
53
54
55
56
57
58
59
60

1
2
3 If you decide to participate in this study, you **will not miss out** on any
4 **treatment**. Participation will **not cost** you **anything** and **after**
5
6 completing the **tests** and the **interview** you will be asked to continue
7
8 participating in your **normal activities**.
9
10
11
12
13
14

15 We will **not record** if you are **behind closed curtains** or completing
16
17 sensitive tasks such as when you are in the **toilet** or **shower**.
18
19
20
21
22

23 We may use the **recordings** of **you** to make a **training package**
24
25 (including a video). You can have **your face blurred out** if you want. If
26
27 you **do not want** to be in the training package we will **not include you**
28
29 in the training package or video.
30
31
32
33
34

35 Your hospital **discharge** will **not be affected** because you are in this
36
37 study. **You** will be **discharged** from hospital when the hospital **medical**
38
39 **team decides** that you are **ready**.
40
41
42
43

44 There are **no known risks** of participating in this study. If you feel
45
46 uncomfortable at any time, you are free to **tell the researcher** and
47
48 **observations** within your room will **stop immediately**. You may
49
50 become **upset** during the **tests** or the **interview**. If this happens you
51
52 can **ask** to take a **break or stop** the interview.
53
54
55
56

57 There will be **no immediate benefit** to you from participating in this
58
59 research; however your participation will allow the collection of
60

1 information that may **help improve** stroke **hospital wards** which may
2 **benefit** future stroke survivors.
3
4
5

6 **Participating** in this study is completely **voluntary**. You **do not have**
7 **to** participate if you don't want to. If you decide to participate you may
8 **withdraw** at **any time** without giving a reason and withdrawing **will not**
9 **disadvantage** you in any way and will **not affect** your hospital
10 **treatment**. If you **decide** that you do **not want to participate** in the
11 study, you **can ask to remove** all of your **information** from the study.
12
13
14
15
16
17
18
19
20
21

22 All the **information** you give will be **confidential**. You will **not be**
23 **identified** by name. You will be **assigned** a unique **code** and any
24 information that may reveal your **identity** will be **removed**.
25
26
27
28

29 All personal health information will be accessed, used and stored in
30 accordance with Commonwealth Privacy Laws. **Information** from all the
31 people in the study is **combined** and **summarised**.
32
33
34
35
36
37
38

39 We will **store** all your electronic **information** on a **password locked**
40 **computer** and **password locked hard drive only accessible by the**
41 **Chief Investigator**. Your hard copy information will be **kept** in a **locked**
42 **cabinet** at Edith Cowan University. Your information will **only** be
43 **accessible to researchers** named on **this study**.
44
45
46
47
48
49
50
51
52

53 The **results** of this study may be **published** in research **journals** or
54 presented at **conferences**. Your **name** will **not** be **used**.
55
56
57
58
59
60

1 **Data** may be **used** in higher degree by **research studies** in the **future**.
2 **Confidentiality** will be **maintained** and no identifying information will
3 be used.
4
5
6
7
8
9

10 **Data** will be **accessible by researchers** through data sharing archives.
11 This data will be governed by an overarching body to ensure data is **only**
12 **used for approved research** purposes. Researchers who access this
13 data from the data bank will not have access to participant information
14 and therefore **will not know your identity**.
15
16
17
18
19
20
21
22
23

24 **Read** this information and be sure you **understand** its content **before**
25 you **agree** to participate in this study.
26
27
28
29
30
31

32 If **you** would **like** to **participate** in this study, please **sign the form**
33 below and **return** it to a **staff** member or a member of the **research**
34 **team**.
35
36
37
38
39
40

41 **Questions or further information?**

42 You **may wish** to **discuss** this information with your **doctor, a relative**
43 **or friend before agreeing** to take part in this study.
44
45
46
47
48
49

50 If you are interested in participating, please tell the researchers. If you
51 have any questions or require any further information about the research
52 project, please contact: Sarah D'Souza [Ph: 0439 982 451].
53
54
55
56

Person responsible information sheet
Stroke patients' communication activity in hospital

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccione	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

The participant is invited to take part in a research project. Sarah D'Souza, a Speech Pathologist and PhD student, is leading the study as Chief Investigator. This study has received ethical approval from ECU Human Research Ethics Committee and Hollywood Private Hospital Research Ethics Committee.

This project is investigating the hospital environment to see how this influences patient activity.

The participant has been selected to take part in this study as they have had a stroke and are receiving treatment at Hollywood Private Hospital. We are interested in

1 seeing how the hospital surroundings affect their communication activity throughout
2 the day. Communication activity involves communication, such as talking with other
3 patients, socialising, reading the paper, using the telephone, talking to staff, or
4 engaging group activities including therapy.
5
6
7
8

9 This information sheet will explain the research project and will detail what is involved in the
10 study. You will be given a copy of this information to keep for your reference.
11
12
13
14

15 Please read through all of the information carefully. You can ask the researcher questions
16 about the study at any time.
17
18
19
20
21

22 **Purpose of the research**

23
24 Little is known about the impact of the hospital rehabilitation environment on patient
25 communication activity levels during stroke recovery. This study will investigate how the
26 hospital stroke ward environment influences patient communication activity levels. The
27 information gathered from this study will assist in improving the Hollywood Private Hospital
28 stroke ward environment to help the recovery of stroke survivors in the future.
29
30
31
32
33
34

35 **What does the stroke patient have to do?**

- 36
37
38
39
40
- 41 • Complete three tests and a recording of them talking to see how their stroke has
42 affected their functioning including their language, concentration and memory. These
43 tests will be conducted at the beginning of the project. The tests will take
44 approximately 1 hour to complete with an option to complete the tests over two
45 separate 30 minute sessions and with as many breaks as the participant needs.
46
47
48
49
 - 50 • Spend approximately 1 hour discussing with the researcher their opinion regarding how
51 their rehabilitation surroundings affect their stay in hospital and activity levels.
52
53
54
55
 - 56 • Allow the researcher to video record, observe and write down what is happening in the
57 participant's environment including their activities for a total of 12 hours over a 3 day
58 period. Video recording is a useful way of capturing the details of everyday activities on
59
60

1 the ward. Often, people forget that the camera is there. Obviously, personal or private
2 activity such as toileting would not be filmed. The participant may not want to be video
3 recorded. If they request, they will not be video recorded. In this case the researcher
4 will only observe, audio record and write down what is happening in their environment
5 including their activities.
6
7
8
9

- 10
- 11 • A researcher will look at the participant's hospital medical file to collect information
12 regarding:
13
 - 14 • The participant's details (such as their age, living arrangements, occupation and
15 level of functioning before stroke)
 - 16 • Any relevant conditions or diseases the participant may have
 - 17 • Information about the participant's stroke (for example when it happened, the
18 area of the brain affected, how it has affected their functioning and abilities)
 - 19 • Details about how long the participant has been in hospital since their stroke
- 20
21
22
23
24
25

26 The participant will not miss out on any treatment. Participation will not cost anything. After
27 completing the tests and the interview the participant will be asked to continue their normal
28 activities.
29
30
31
32
33

34 The participant's hospital discharge will not be affected because they are in this study. The
35 participant will be discharged from hospital when the hospital medical team decides that they
36 are ready.
37
38
39
40
41
42

43 There are no known risks of participating in this study. If the participant feels uncomfortable
44 at any time, you or the participant are free to tell the researcher and observations within
45 their room will stop immediately. The participant may become upset during the tests or the
46 interview. If this happens you or the participant can ask to take a break or stop the interview.
47
48
49
50
51

52 There will be no immediate benefit to you or the participant from taking part in this research;
53 however **their participation will allow the collection of information that may help**
54 **improve stroke hospital wards which may benefit future stroke survivors.**
55
56
57
58
59
60

1 Participating in this study is completely voluntary. The participant can withdraw from taking
2 part in the study at any time without giving a reason for withdrawing.
3
4
5

6 The participant can request access to their research data at any time. They can request any
7 of the information collected to be amended or removed if it is incorrect or they disagree with
8 it. Please contact Sarah D'Souza (phone: 0439 982 451) if you would like to discuss
9 accessing the participant's information.
10
11
12
13
14
15

16 The video, audio and written data will be identified by code. The information you provide will
17 remain completely confidential. There will be no identifying information attached to the data
18 and any information that may reveal the participant's identity will be removed. A list of
19 participant names and codes will be kept in a locked filing cabinet at Hollywood Private
20 Hospital and will only be accessible by the research team. All personal health information will
21 be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will
22 be stored on a password controlled computer or in a locked cabinet at Edith Cowan
23 University. Electronic data will be backed-up on a password controlled hard drive only
24 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after
25 completion of the study. Video and audio recordings will then be permanently deleted and
26 hard copy data will be shredded.
27
28
29
30
31
32
33
34
35
36
37

38 Non-identifiable data will be accessible by researchers through data sharing archives. This
39 data will be governed by an overarching body to ensure data is only used for approved
40 research purposes. Researchers who access this data from the data bank will not have access
41 to participant information therefore data will not be re-identifiable.
42
43
44
45
46

47 The results of this study may be published in research journals or presented at conferences.
48 The results will not include any information that may identify participants. Data may be used
49 in higher degree by research studies in the future. In this circumstance, confidentiality will be
50 maintained and no identifying information will be used.
51
52
53
54
55
56

57 Data collected from this study (including videos) may be used to develop training packages to
58 improve future stroke survivors' communication activity levels in the future. We can blur out
59
60

1 the participant's face if they want. If they do not want to be in the training package we will
2 not include them in the training package.
3
4
5

6 At the end of the research project a summary of the results will be provided to you and the
7 participant.
8

Investigating Enhanced Environments after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is exploring stroke patient's experiences in regards to the environment of an in-patient stroke rehabilitation unit. We want to explore stroke patient communication activity, which includes activities such as talking with other patients and visitors, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy.

The participant has agreed to take part in this study. They have agreed to be video recorded for a total of 12 hours over a three day period.

Your interactions with the patient will be video recorded and manually recorded by the chief investigator to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. You do not need to do anything other than complete your usual tasks and activities. We will not record if you are having sensitive conversations with the participant, if they are behind closed curtains or completing sensitive tasks such as toileting or showering.

1 We may use the recordings of you to make a training package (including a video). You can have your face
2 blurred if you want. If you do not want to be in the training package we will not include you in the training
3 package.
4

5
6
7
8 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
9 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
10 without giving a reason and withdrawing will not disadvantage you or the participant in any way.
11
12

13
14
15 You may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you
16 may not benefit from participating in this study. There are no known risks associated with participating in
17 this study.
18
19

20 21 22 23 **Confidentiality of information**

24
25 The video, audio and written data will be identified by code. There will be no identifying information
26 attached to the data and any information that may reveal your identity will be removed. A list of participant
27 names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be
28 accessible by the research team. All data will be accessed, used and stored in accordance with
29 Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked
30 cabinet at Edith Cowan University. Electronic data will be backed-up on password controlled hard drive only
31 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the
32 study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.
33
34
35
36
37
38

39
40
41 Non-identifiable data will be accessible by researchers through data sharing archives. This data will be
42 governed by an overarching body to ensure data is only used for approved research purposes.

43
44 Researchers who access this data from the data bank will not have access to participant information
45 therefore data will not be re-identifiable.
46
47

48
49
50 The results of this study may be published in research journals or presented at conferences. The results
51 will not include any information that may identify participants. Data may be used in higher degree by
52 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
53 information will be used.
54
55

Description of the research project

This study is exploring staff and stroke patient's experiences in regards to the environment of the Edwards and Woods wards at Hollywood Private Hospital. We want to explore stroke patient communication activity, which includes activities such as talking with other patients, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy. We would like to explore staffs' perceptions of barriers and facilitators to communication activity on the wards and address these in order to enhance the ward environment.

Staff have been selected to participate in order to gain a range of perspectives in regards to the day to day operations, procedures, policies and interactions that influence the environment of the Edwards and Woods wards. A training program for staff will be designed to address barriers and facilitators identified on the wards.

There are two components of this research study that involve staff. You may wish to consent to participate in one or both parts of this study.

1
2 **Part 1:** Stroke in-patients will be video recorded for a total of 12 hours over a three day period. Your
3 interactions with the patient will be video recorded and manually recorded by a member of the research
4 team to explore patient communication activity levels. You can choose to be observed by the researcher
5 only if you do not want to be video recorded. You do not need to do anything other than complete your
6 usual daily tasks and activities. We will not record if you are behind closed curtains or completing sensitive
7 tasks such as toileting or showering the patient.
8
9
10
11
12
13
14

15 We may want use the recordings of you to make a training package (including a video). We will show you
16 the video we want to use and explain exactly how this will be used before we do anything. You can have
17 your face blurred out if you want. If you don't want to be included in the training package we will not include
18 any videos of you in the training package.
19
20
21
22
23

24 **Part 2:** You will be asked to take part in the following:
25

- 26 • A focus group with the researcher and your co-workers for approximately 1 hour to explore your
27 perceptions of environmental barriers and facilitators to activity.
- 28 • Attend a training program for approximately 1.5 hours. This will focus on training staff to promote
29 patient communication on the ward. This session will be located at Hollywood Private Hospital and
30 will be offered over several dates to facilitate your ability to attend. If you are unable to attend the
31 training program we may provide training and video resources to facilitate your participation in
32 training.
- 33 • Complete an anonymous short questionnaire before and after attending the training program to gain
34 feedback on training and explore your perception of changes in your knowledge, skills and attitudes
35 towards communication and aphasia.
- 36 • A final focus group with the researcher for approximately 1 hour to again explore your perceptions
37 of environmental barriers and facilitators to activity.

38 The focus groups will be tape recorded however at any stage you may ask for the tape to stopped,
39 edited or have your comments erased.
40
41
42
43
44
45
46
47
48
49
50

51 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
52 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
53 without giving a reason and withdrawing will not disadvantage you in any way.
54
55
56
57
58

59 You may benefit from gaining knowledge and skills regarding communication from attending the training
60 program. Additionally, you may also benefit from the knowledge that you are helping future stroke

1 survivors. It is possible that you may not benefit from participating in this study. There are no known risks
2 associated with participating in this study.
3
4
5

6 **Confidentiality of information** 7

8 The information you provide during the interviews will be audio recorded by the Chief Investigator. Your
9 perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'. This will be
10 used to inform the development and review of the training program.
11
12
13

14
15
16 The video, audio and written data will be identified by code. The information you provide will remain
17 completely confidential. There will be no identifying information attached to the data and any information
18 that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked
19 filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be
20 accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a
21 password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be
22 backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be
23 stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be
24 permanently deleted and hard copy data will be shredded.
25

Description of the research project

This study is a Communication Enhanced Environment (CEE) at Hollywood Private Hospital. A CEE involves several initiatives that aim to provide more opportunities for communication for stroke survivors on the ward. One of these initiatives involves the participation of volunteers.

As a volunteer participant, you will be asked to take part in the following:

- Attend a training program for approximately 1.5 hours. This will focus on training volunteers in communicating with stroke patients with communication difficulties. This session will be located at Hollywood Private Hospital and will be offered over several dates to facilitate your ability to attend. If you are unable to attend the training program we may provide training and video resources to facilitate your participation in training.
- Complete an anonymous short questionnaire before and after attending the training program to obtain your feedback on the training session.

- A focus group with the researcher and other volunteers for approximately 1 hour to explore your perceptions of communicating with stroke patients. The focus group will be tape recorded however at any stage you may ask for the tape to stopped, edited or have your comments erased.
- Host a communal dining and lounge area once a week to offer tea and coffee and provide social companionship for stroke patients.
- Your interactions with the patient may be video recorded and manually recorded by a member of the research team to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. We will not record if you are having sensitive conversations with the stroke patient/s.

There will be no cost to you associated with participating in this study. Participation is completely voluntary. You do not have to participate if you don't want to. If you decide to participate you may withdraw at any time without giving a reason and withdrawing will not disadvantage you in any way.

You may benefit from gaining knowledge and skills regarding communication from attending the training program. Additionally, you may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you may not benefit from participating in this study. There are no known risks associated with participating in this study.

Confidentiality of information

The information you provide during the interviews will be audio recorded by the Chief Investigator. Your perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'.

The video, audio and written data will be identified by code. The information you provide will remain completely confidential. There will be no identifying information attached to the data and any information that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data is only used for approved research purposes.

1 Researchers who access this data from the data bank will not have access to participant information
2 therefore data will not be re-identifiable.

Abstract

Objectives: To explore barriers and facilitators to patient communication in an acute and rehabilitation ward setting from the perspectives of hospital staff, volunteers and patients following stroke.

Design: A qualitative descriptive study as part of a larger study which aimed to develop and test a Communication Enhanced Environment in an acute and a rehabilitation ward.

Setting: A metropolitan Australian private hospital.

Participants: Focus groups with acute and rehabilitation doctors, nurses, allied health staff and volunteers (n=51) and interviews with patients following stroke (n=7), including three with aphasia, were conducted.

Results: The key themes related to barriers and facilitators to communication, contained sub-categories related to hospital, staff and patient factors. Hospital related barriers to communication were private rooms, mixed wards, the physical hospital environment, hospital policies, the power imbalance between staff and patients, and task specific communication. Staff related barriers to communication were staff's perception of time pressures, underutilisation of available resources, staff individual factors such as personality, role perception and lack of knowledge and skills regarding communication strategies. The patient related barrier to communication involved patients' functional and medical status. Hospital related facilitators to communication were shared rooms/co-location of patients, visitors and volunteers. Staff related facilitators to communication were utilisation of resources, speech pathology support, staff knowledge and utilisation of communication strategies and individual staff factors such as personality. No patient related facilitators to communication were reported by staff, volunteers or patients.

Conclusions: Barriers and facilitators to communication appeared to be interconnected and likely to influence one another suggests communication access may vary between patients within the same setting. Practical changes may promote communication opportunities for patients in hospital early after stroke such as access to areas for patient co-location as well as areas for privacy, encouraging visitors, enhancing patient autonomy, and providing communication trained health staff and volunteers.

Study strengths

- This study involved a large number of staff in comparison to previous studies and included volunteers as well patients after stroke with and without aphasia.
- Data saturation was reached within the staff focus groups.

Study limitations

- The results in this study reflect the perceptions of a small number of medical (n=2) and nursing staff (n= 11) compared to allied health staff (N= 32).
- This study involved exploring the perceptions a small number of patients; a broader range of perspectives may have been expressed with a larger number of participants.
- This study was conducted at a private hospital involving a mixed acute and a mixed rehabilitation ward therefore these results reflect this context.

Background

Aphasia research supports the theory that commencing aphasia rehabilitation in the early phase post-stroke (<1-month post-stroke) results in better outcomes than therapy commenced in the chronic phase (>6-months post stroke).^{1,2} However, patients in hospital following stroke spend on average 50-94% of their day inactive.^{3,4} Despite improvements in functional independence during their hospital admission following stroke, patients' engagement in cognitive and social activity remains largely unchanged.⁵ Patients with aphasia spend two thirds less time engaged in social interactions with family and friends compared to those without aphasia.⁶ A lack of social and cognitive activity early after stroke for patients with aphasia has the potential to contribute to: i) the development of maladaptive compensatory communication behaviours, and ii) the learned non-use of language, which may ultimately impact on their quality of life and overall language recovery.⁶

Patients following stroke with and without aphasia have described time outside therapy as "dead" and "wasted", reporting a lack of stimulation and inactivity in hospital impacting their ability to self-direct their rehabilitation outside of therapy.⁷ They report the experience of boredom is worse in the evenings and weekends when there are less structured activities.⁸ They also perceive that boredom negatively influences their mood, motivation, and contributes to their experience of post-stroke fatigue.⁸ Boredom is associated with a loss of autonomy and sense of control and contributes to patients becoming passive recipients of care, which may have negative implications for stroke recovery.⁸

This study aimed to explore hospital staff and volunteer, and patient perceptions of barriers and facilitators to patient communication in an acute and a rehabilitation hospital ward. Identifying barriers and facilitators to patients' communication will inform the development of a Communication Enhanced Environment (CEE) for the purposes of increasing their engagement in language activity within a hospital ward to maximise post-stroke aphasia language recovery.

Methods

Design

This was a sub-study of a larger study which aimed to develop and test a CEE model within an acute and a rehabilitation ward (see supplementary file for study protocol and

1
2
3 procedure). This sub-study contributed to the baseline phase of the larger study outlined
4 below:
5

- 6
7 *i) Baseline phase:* observe and quantify levels of engagement in language activity in the
8 acute and rehabilitation ward environment for patients following stroke, and explore
9 hospital staff, volunteers, and patients' perceptions of barriers and facilitators to
10 communication in hospital;
11
12 *ii) Implementation phase:* develop and implement the CEE model on the acute and
13 rehabilitation wards;
14
15 *iii) Post-implementation phase:* assess the impact of the CEE model on patient
16 engagement in language activity, and hospital staff, volunteers and patients'
17 perceptions of barriers to communication in hospital.

25 Ethics Committee (ECU HREC 12149) and The Hollywood Private Hospital Research Ethics
26 Committee (HPH431).
27
28

29 **Reporting guidelines**

30
31 The consolidated criteria for reporting qualitative studies (COREQ)⁹ was used to
32 guide reporting this study (Appendix A.).
33
34

35 **Research authors' relationship with participants**

36
37 The first author who was external to the hospital conducted focus groups and
38 interviews. The first author engaged key hospital team members for the duration of the
39 study to inform the study design to ensure it aligned with the hospital policies and priorities.
40
41
42

43 **Patient and public involvement**

44
45 Patients and the public were not involved in the design of this study however this
46 data informed the development of the CEE model in the larger study. A working group
47 consisting of key members of the stroke multidisciplinary team provided feedback on this
48 study's findings and were involved in the development of the CEE model and embedding
49 approach, which was based on the outcomes of this sub-study.
50
51
52

53 **Setting**

54
55 This study was conducted on an acute and a rehabilitation ward at a private hospital
56 in Perth, Western Australia. The acute ward was a 26- bed unit with patients following acute
57 stroke as well as other medical conditions. The acute ward had four individual rooms and
58
59
60

nine shared rooms, two rooms with four beds per room, and seven rooms with two beds per room. Patients ate meals in their rooms and had access to an outdoor balcony area. The rehabilitation ward was a 44-bed mixed rehabilitation unit for patients following stroke and other medical, orthopaedic and post-surgical conditions. There were thirty-six individual rooms, and four shared rooms with two beds in each room. Patients had breakfast in their rooms but were encouraged to eat lunch and dinner in one of two communal dining areas.

Participants

Hospital staff participants: Purposeful sampling of acute and rehabilitation hospital staff was conducted to include at least one representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members who were over 18 years of age. Formal consent to participate in the study was completed by the first author (see supplementary file for consent forms and procedures). A total of 51 staff and volunteers were recruited (Table 1.) by contacting staff department managers who identified staff currently working or had previously worked with patients following stroke on the acute or rehabilitation wards.

Patient participants: All patients consecutively admitted following stroke from January to February 2016, and June 2016 to July 2017 were screened for eligibility by the hospital site champions to participate in the study. Inclusion criteria: i) admitted to the acute or rehabilitation ward with an acute stroke, ii) less than 21 days post-stroke during data collection, iii) able to provide informed consent based on the judgement of the medical team responsible for the medical management of the patient, iv) Glasgow Coma Scale¹⁰ greater than 10, v) estimated total length of hospital stay greater than 14 days, vi) adequate English proficiency to participate in interviews as determined by managing speech pathologist or medical team. Exclusion criteria: i) uncorrected hearing or vision (for example hearing impairment without the use of hearing aids or vision impairment without the use of glasses), ii) medically unstable, iii) documented diagnosis of current untreated depression, documented diagnosis of dementia, previous aphasia or traumatic brain injury. The diagnosis of aphasia was confirmed for those who achieved a Western Aphasia Battery-Revised¹¹ Aphasia Quotient score less than 93.7. Eligible patients were approached by the site investigators for consent to be approached by the research team. The first author completed formal consent with all patient participants (see supplementary file for consent forms and procedures). A total of 9 patients were recruited, however 2 patients were withdrawn as they became medically unwell. Data collection was completed for 4 patients without aphasia and 3 patients with aphasia. See Figure 1. for the summary of patient screening and recruitment. Patient details and demographics are detailed in Table 2.

No staff or patients withdrew from participating in this study.

Data collection

The first author, a female speech pathologist (Bachelor of Speech Pathology, Honours) and PhD student with seven years clinical experience working in the hospital setting and five years research experience, including conducting interviews and focus groups, completed all semi-structured interviews and focus groups. Staff were informed that the researchers wanted to investigate their perceptions of the hospital ward environment in regards to communication opportunities to inform the development of a Communication Enhanced Environment (see supplementary file for staff and volunteer information and consent forms). Patients were informed that the researchers wanted to explore how the hospital environment influenced patient activity (see supplementary file for patient information and consent forms).

1
2
3 All interviews and focus groups were conducted using interview and focus group
4 guides (staff focus groups and interview guide Appendix B., patient interview guide
5 Appendix C.) and were audio recorded. Field notes were completed by the first author
6 during data collection. Seven staff focus groups were conducted with two to eight
7 participants in each focus group. One-on-one interviews were conducted with two staff
8 members. All staff focus groups were completed on the hospital site in various locations
9 that were private and quiet. Six out of seven patient interviews were conducted in person
10 during their inpatient admission in their hospital room, and one was completed over the
11 phone (patient without aphasia) one day following discharge from hospital. All patient
12 interviews were conducted within fifteen days post-stroke. Interview and focus groups were
13 20-60 minutes long, often varying based on the number of participants. Supported
14 conversation strategies¹² were used during interviews with patients with aphasia to
15 facilitate their participation in the interview. One patient with aphasia had two family
16 members present during the interview. During the interviews and focus groups, clarifying
17 questions and paraphrasing participant comments were used to confirm and clarify their
18 perspectives and insights.

Data analysis

Focus groups and interviews were transcribed verbatim. Responses to any leading questions were removed from the data set.¹⁵

The theoretical framework for this research was a qualitative description approach.¹⁶ This approach involves describing patient experiences, with minimal interpretation of the data to minimise potential bias of the researchers.¹⁶ Participant experiences were analysed using NVivo¹⁷ computer software to manage the data. Data were grouped into themes according to content.¹⁶ The first level of coding identified the broad content of the data then sub-categories were identified.¹⁶ Single lines of data were not removed from their 'story' during data analysis to maintain the context and help ensure meaning was not lost or misinterpreted.¹⁶ Ongoing critical review of the categories were conducted and themes were reviewed by a second researcher.¹⁶ Staff were provided feedback on the findings.

Results

The key themes from the focus group and interviews related to barriers and facilitators to communication, with sub-categories identified which related to hospital, staff and patient factors (Figure 2.).

Barriers to Communication

Hospital related factors

Private rooms reduce opportunities for social interaction

Staff and patients described the impact of single rooms which limited incidental socialisation with other patients and their visitors.

We used to co-locate our stroke patients [sic] and often using our shared rooms.

That's when people had more opportunities for interacting with one another.

(MedC1)

Mixed wards affect staff acquisition of specialist skills

Staff described their perception of the negative effect a mixed hospital ward had on the acquisition of stroke specific specialist skills.

Having a stroke specific ward... everybody on the ward would be trained...and that's the only thing they'd have to focus on rather than having lots of other patients with lots of medical conditions. (OT4)

Hospital environment does not encourage socialising

Staff talked about the physical hospital ward environment affecting social interaction as it contributed to a sterile atmosphere rather than one that promoted social activity. Staff also talked about the consequence of background noise and environmental distractors in large shared rooms on the acute ward which reduced their ability to communicate with patients with communication impairments.

My general feeling of rehab [rehabilitation] is that they come to their sessions and then they go back to their lonely dark room... I don't really see the rooms as a particularly happy, busy place where they are getting a lot out of being in there... the dining rooms... they're not a particularly pleasant place to be either. (PT2)

They [patients] can hear other people talking... there is [sic] a lot of voices going on which is going to impact on their understanding as well. (PT3)

Hospital policies restrict the development of communication-promoting ideas and initiatives

Hospital policies were perceived by staff as a barrier to communication, negatively influencing their ability to develop ideas and initiatives to increase patients' opportunities for social interaction. This included policies regarding leaving patients unattended in dining

1
2
3 areas without patient care assistants supervising them and requiring nurses to supervise
4 patients if they are eating; and reported limitations around food related activities as a result
5 of food hygiene policies and occupational health and safety.
6
7

8 It's just every time you try and do something you hit a barrier... you do try and think
9 outside the box what more can you do for this patient and you get another hospital
10 rule. (PT2)
11
12
13

14 **Power imbalance of staff and patients in hospital controls patients' ability to access** 15 **communication opportunities**

16 Staff and patients discussed the influence of the power imbalance for patients in
17 hospital, and patient perceptions that they have to do what is expected in the hospital
18 environment. This appeared to limit the patients' ability to freely engage and explore the
19 environment resulting in patients retreating to their rooms and limiting their opportunities
20 to engage in activities.
21
22
23
24
25
26

27 I think most males like to account for their time um and I felt like I haven't been able
28 to do that and that's, that's the bit that I'm really, really lacking. (PWA2)

29 I was in the hospital so I think I had to stick into the room, to the rules. (PWOA2)

30 Very often when you're in a hospital you do what you think you're expected to do.
31
32
33
34 (SP4)
35

36 **Task specific communication reduces patients' communication opportunities**

37 Staff talked about the nature of interactions with patients as often being driven by
38 the patient's care, restricting opportunities for communication beyond this context.
39

40 I know we aim to be very holistic... but very often care is very[sic] directed from a
41 medical health care perspective (SP4)
42
43
44
45

46 **Staff related factors**

47 **Staff's perception of time pressures limiting opportunities for communication**

48 Both patients and staff perceived staff time pressures as a barrier negatively
49 effecting communication on the wards. This may be the reflection of actual time pressures,
50 or staff perceptions of their available time. Some staff reported that they felt interactions
51 with patients with communication impairments required extra time which was challenging
52 in a time pressured hospital environment. Time pressures were also perceived to restrict the
53 staff's ability to facilitate opportunities for patients to socialise with other patients. For
54
55
56
57
58
59
60

1
2
3 example, nurses appeared to deprioritise transferring patients to the communal area for
4 lunch in busier times.
5

6
7 If they're hoist patients it might not be as easy for staff to get them to the dining
8 room, that wouldn't totally prevent someone from going, it would just depend on
9 the time that people had on the day. (SW3)
10
11

12 **Staff and patient's underutilisation of available resources**

13
14 Staff described the lack of accessible resources as a factor negatively affecting staff-
15 patient communication. They described the need for resources when communicating with
16 patients with aphasia and other communication impairments but felt unsure about what
17 these were or how to access them. They also described a number of resources that they felt
18 patients were not aware of and therefore did not utilise such as volunteer services that
19 promote communication opportunities and facilitate patient access to outdoor areas.
20
21
22
23
24

25
26 I feel like I don't know where else to go. I don't know if other things that [sic] could
27 help us, maybe there's things out there that I don't know about that would help us
28 communicate with these patients. (PT2)
29
30

31
32 There are all of these opportunities but I don't think a lot of the patients access them
33 so it sounds like great communicative opportunities for them but the reality is that a
34 lot of them are sitting in their rooms most of the times by themselves watching
35 television and most of the interactions they have is with the nurses or just whoever
36 comes in to see them. (SP4)
37
38
39
40

41 **Individual staff factors leading to restricted opportunities for communication**

42
43 Staff described individual staff factors such as personality, values and attitudes
44 influencing communication opportunities for patients, such as staff providing patients with
45 opportunities for incidental social interaction during routine tasks.
46
47

48
49 Often if people need to go in and see the patient let's just say to take obs
50 [observations] or to do a wash... they don't always use that opportunity as an
51 opportunity to chat... there could be more opportunity to chat at those times whilst
52 they are doing what they need to get done and you know that varies from person to
53 person, personality as well and how busy people are, what else is going on. (SP3)
54
55
56

57 **Staff's perception their role does not include communication tasks**

1
2
3 Some staff perceived communication as a task separate from the responsibility of
4 their role therefore limiting their facilitation of communication opportunities for patients.
5

6 They [speech pathologists] do their bit and we do ours... we don't have time to
7 practice speech with them because we really do have to get all of our jobs filled in
8 the time and it's specifically rostered for us to do our work, not to help with
9 someone else's. (RehabN1)
10
11
12
13

14 **Lack of staff knowledge and skills resulting in unsuccessful communication interactions or** 15 **avoiding communication interactions** 16

17 Staff described a lack of knowledge and skills in communicating with patients with
18 communication impairments. Some staff reported feeling anxious about encouraging
19 patients to communicate as communication breakdowns may cause stress and anxiety for
20 the patient, and the staff member. Staff reported a lack of confidence in their ability to
21 repair communication breakdowns which resulted in increased time pressures in their
22 sessions, often leading them to avoid encouraging communication interactions within their
23 treatment sessions.
24
25
26
27
28
29

30 I find it challenging... knowing how the best way to communicate with that person
31 [with aphasia]... then [they] become very frustrated and not have the tools
32 themselves to communicate back to me and you would never want to leave
33 someone in that space. So that's something that I struggle with. (SW2)
34
35
36
37

38 **Patient related factors** 39

40 Patient related factors reflected their functional and medical status, personality,
41 mood and motivation, which were perceived by staff and patients to often act as a barrier to
42 engaging in communication interactions during their hospital admission early after stroke.
43
44

45 **Patients' functional and medical status limiting their ability to seek out and engage in** 46 **activities** 47

48 Staff and patients perceived patients' medical status as a barrier to communication
49 by limiting their ability to engage with their environment including independently seeking
50 out activities and being able to utilise communal areas.
51
52
53

54 If someone is bed bound, you know the interaction is very minimal... you often walk
55 past and you see them alone in their room... you wonder what happens during those
56 periods of time where they're just in their room and they don't have family. (OT2)
57 Well, I can't do anything cos I can't go off by myself and do anything. (PWOA2)
58
59
60

Individual patient factors limiting opportunities for communication

Staff described individual patient factors such as personality, mood and motivation communication opportunities for patients such as independent practice of communication therapy tasks, and social opportunities with patients and hospital staff.

We have to recognise some patients who have had strokes... they're fed up with having people poking and prodding them then have a volunteer and go "do you want to do your exercises for speech?" (VM)

They need a break after OT [the occupational therapist] has done a shower. If they don't get that break then the physio isn't going to be as good for them because they're so tired, so we also have to look at break times in between each sessions... (OTA1)

Facilitators to Communication

Hospital related factors

Shared rooms/co-location encourages incidental social interactions

Staff talked about use of communal areas at other hospitals which facilitated socialisation and communication during non-therapy times and during group therapy. Staff described the importance of the use of communal areas given the large number of private rooms on the ward. Patients also described the need to be co-located to promote social interaction.

I think that, put the [sic] whole lot of people together and ah and they [sic] something collective, that's what human beings are put together for ... sitting around talking... over the proverbial cuppa. (PWA2)

Visitors provide patients opportunities for socialisation

Staff identified visitors as a facilitator to communication interaction for patients outside of therapy times during their inpatient admission.

Interaction with the family... it's not therapy based but it's their [patients'] opportunity to practice. (PT1)

Volunteers facilitate opportunities for patients to engage in social activities

Staff discussed the benefit of volunteers in facilitating opportunities for patients to engage in social interactions including programs involving therapy dogs, book loaning, hand massages, and taking patients off the ward.

1
2
3 If we see people that are lonely, are not getting visitors, there's many volunteers... to
4 go and visit them and if they're well enough they can take them out... the volunteers,
5 we do rely on them. (OTA1)
6
7
8
9

10 **Staff related factors**

11 **Staff utilisation of resources promote communication exchange**

12 Staff identified access to resources such as chat books and alternative and
13 augmentative communication boards often facilitated communication interactions with
14 patients with communication impairments on the ward.
15
16
17
18

19 Sometimes with the ... signs... "do you want to drink? some water?" or something, so
20 they can just point because ... they want to say something and maybe the right
21 words are not coming out... that also helps. (RehabN3)
22
23
24

25 **Speech pathology support and education facilitates staff's use of communication** 26 **promoting strategies**

27 Staff reported support and education from speech pathology staff facilitated their
28 ability to interact successfully with patients with aphasia.
29
30
31

32 I had a patient who had word finding difficulties... I just was observing the speechie
33 [speech pathologist], she would just be like "no, what do you mean?" and he'll be
34 like [pointing] and she'll be like "tell me what's the word"... it's something I could
35 have just added to my session. (PT4)
36
37
38
39

40 **Staff knowledge and utilisation of communication strategies promotes communication** 41 **activities**

42 Staff and volunteers discussed the use of communication strategies and resources to
43 facilitate communication on the ward for patients with a variety of communication
44 impairments.
45
46
47

48 We use communication boards, pictures, writing things down, talking slowly.
49

50 (MedC2)

51 If they are having trouble, I will say to them "it's okay you don't need to hurry, that's
52 fine". (V1)
53
54
55

56 **Individual staff factors promote communication opportunities for patients**

1
2
3 Staff and patients talked about how individual characteristics of staff, including
4 rapport building and being friendly, facilitated communication for patients with
5 communication difficulties.
6
7

8 Sometimes they [patients] look for that specific person... the more they get
9 confident, the more they get relaxed, the more their speech enhances as well.
10
11
12 (RehabN3)
13
14
15

16 Discussion

17 This study aimed to explore hospital staff, volunteers and patients' perceptions of
18 barriers and facilitators to communication on an acute and a rehabilitation ward. A wide
19 range of factors were perceived to act as potential barriers or facilitators to communication.
20 Additionally, a number of factors influencing patient access to communication opportunities
21 appeared to influence one another.
22
23
24
25
26

27 The co-location of patients in therapy spaces, dining areas or in shared rooms were
28 perceived as facilitators to communication for patients, providing opportunities for
29 incidental social interactions with other patients and their visitors. However, background
30 noise in these shared spaces was also perceived to act as a barrier to their ability to engage
31 in communication. Patient access to communal spaces was influenced by a number of
32 factors including patients' sense of autonomy to freely explore the hospital ward
33 environment, and their medical and mobility status, and staff's perception of their available
34 time, which influenced staff's perception of whether they transferred patients to these
35 spaces. Rosbergen et al¹⁸ reported that in an acute stroke ward enriched environment
36 communal mealtimes and group activities were perceived to facilitate social activity. The
37 study by Rosbergen et al¹⁸ found that staff reported perceptions that shared rooms limited
38 staff and patients' ability to engage in private conversations, consistent with O'Halloran et
39 al's¹⁹ findings. It may be that access to both private and communal spaces available within
40 the hospital environment play critical roles in regards to providing opportunities for social
41 interactions with other patients and their visitors and opportunities for privacy when
42 required.
43

46
47
48
49
50
51
52
53
54
55

56 The acute and rehabilitation wards had a large proportion of single rooms, which
57 could have been considered the result of this study being conducted at a private hospital.
58 However, there has been a perceived trend towards increased proportions of single rooms
59
60

1
2
3 in newly built public hospitals to promote infection control and patient privacy which may
4 have a detrimental effect on communication.^{20,21} The predominance of single rooms and
5 limited opportunities to access shared spaces may have increased the effect of other
6 barriers on communication opportunities for patients. For example, a patient with poor
7 autonomy may be more likely to remain alone in their single room when they are not
8 attending therapy, as they perceive they are not 'allowed' to freely explore the hospital
9 environment. This may reduce the likelihood of the individual independently seeking out
10 social interactions beyond their room. If they also have reduced mobility, they may be more
11 reliant on staff to facilitate transfers to communal spaces which may be impacted by staff
12 time constraints. The patient's functional status and levels of fatigue may also limit their
13 ability to initiate and engage in activities while they are in their room. Therefore, the
14 combined effect of these barriers may significantly limit this patient's communication
15 opportunities.

These communication barriers may be mitigated by having scheduled rest periods,
and periods allocated to encouraging visitors to provide opportunities for communication
and socialisation within their room, and facilitate patient access to shared spaces, such as
helping mobilise wheelchair users into communal dining areas or education to patients that
they are allowed to explore the hospital ward environment. Rosbergen et al¹⁸ identified
patient and family autonomy to initiate and direct activity as a factor enriching the acute
ward environment. Therefore, increasing patient autonomy within this setting may facilitate
their ability to seek out interactions within the environment and increase engagement in
communication activity, which may then reduce the effect of being in a single room with
reduced mobility and time poor staff.

A potential lack of opportunities to access social interactions with other patients
means staff, including volunteers, and visitors may become the main communication
partner for patients. Godecke et al's⁶ observation study found that nurses are the most
frequent communication partner for patients following stroke with aphasia, after their
family members, therefore patient-staff interactions may play a significant role for those
patients with minimal or no visitors. It is interesting to note that this study recruited a
limited number of acute nurses in comparison to rehabilitation nurses. This could be
interpreted as a reflection of differences in nurses' capacity for additional activities within
the demands and time restrictions of the acute ward context in comparison to the

1
2
3 rehabilitation ward context. Within the current study, communication between staff and
4 patients appeared to be dependent on a number of factors including staff perception of
5 their role, their knowledge and skills in facilitating communication, their values and
6 attitudes towards communication and whether supporting language and communication for
7 patients with aphasia is part of their 'role', their willingness to be flexible with their time,
8 and their knowledge of and access to resources which may be used to facilitate
9 communication. This also highlights the potential impact of the perceived power imbalance
10 between staff and patients and the significance of interactions that are task directed. Hersh
11 et al²¹ reported patients with aphasia felt disempowered in communicative interactions
12 with nurses. Nurses often talked to the task and controlled interactions with
13 patients.^{22,23} This highlights the need for communication partner training which may provide
14 staff with the knowledge and skills required to support effective communication with
15 patients with aphasia.²⁴ Implementation strategies will need to be considered to promote
16 behaviour change as well as the uptake and maintenance of training including involvement
17 of management and ward champions, and ensuring trained communication strategies are
18 easy to learn, apply and audit in order to be applicable in this busy context.²⁵

Time pressure was perceived as a major barrier to communication impacting on staff's ability to support successful communication within their interactions with patients and facilitate patients' opportunities to engage in interactions in social or communal areas. Time constraints have been reported to limit communicative opportunities between patients following stroke and nurses.²⁶ Ball et al²⁶ found that 86% of surveyed nurses reported one or more activities had been "left undone" in their last shift as a result of lack of time. The study found that activities most likely to be missed by nurses as a result of time constraints were comforting and talking to patients (66%) and patient education (52%).²⁶ This has also been identified by patients who "did not like to bother the busy nurse".²⁷ Time limitations and pressures on the wards may be facilitated by developing staff knowledge of and skills in using communication promoting strategies. Effective and efficient nurse patient communication as a result of nurse training has been found to save time, reduce frustration and reduce the burden associated with caring for patients following stroke with aphasia.²⁸ Additionally, time limitations reported by staff may lend to an argument for additional nursing allocation for patients with communication impairments.

1
2
3 This study included a small number of medical and nursing staff in comparison to
4 compared to allied health staff which may be reflected in the reported results. This study
5 also involved a small number of patients and a broader range of perspectives may have
6 been expressed with a larger number of participants. This study was conducted at a private
7 hospital involving a mixed acute and a mixed rehabilitation ward, and a relatively
8 homogenous groups of participants linguistically and ethnically, therefore these results
9 reflect this context and may not be directly generalisable to hospitals in the public sector,
10 nor did they explore cultural factors contributing to communication.

17

18 **Conclusions**

19 The barriers and facilitators to communication appear to be interconnected and
20 likely to influence one another, suggesting that the level of communication access may vary
21 from patient to patient within the same setting. Results of this study highlight a number of
22 practical changes that could be implemented to promote communication opportunities for
23 patients admitted to hospital early after stroke. However, implementation of behaviour and
24 cultural change strategies may be pertinent to promote meaningful and sustainable change
25 within the hospital setting. Consideration of areas for co-location for patients such as
26 therapy spaces, dining areas or shared rooms as well as access to private spaces may
27 potentially address the need for social opportunities with other patients as well as access to
28 privacy when required. The promotion of visitors attending the wards may facilitate
29 communication opportunities for patients between therapy times by providing socialisation
30 in patients' rooms as well as facilitating and advocating for patient access to communal
31 areas. This has the potential to mitigate the effect of social isolation in single rooms, staff
32 time restraints and limitations as a result of patients' medical status. Strategies to promote
33 patient autonomy in hospital may promote their ability to freely explore the environment
34 beyond their room may help address the power imbalance that can occur between patients
35 and hospital staff. Additionally, health staff and volunteer education in using
36 communication promoting strategies may increase opportunities for interactions between
37 patients, and staff or volunteers and promote communication exchange within those
38 interactions. These factors will be explored in a Communication Enhanced Environment,
39 which aims to increase patients' opportunities to engage in language activities during early
40 stroke recovery in hospital.

Consolidated criteria for reporting qualitative studies (COREQ)⁹: 32-item checklist

No Item	Guide questions/description	Location within paper
Domain 1: Research team and reflexivity		
Personal Characteristics		
1. Interviewer/facilitator	Which author/s conducted the interview or focus group?	Page 10
2. Credentials	What were the researcher's credentials? E.g. PhD, MD	Page 10
3. Occupation	What was their occupation at the time of the study?	Page 10
4. Gender	Was the researcher male or female?	Page 10
5. Experience and training	What experience or training did the researcher have?	Page 10
Relationship with participants		
6. Relationship established	Was a relationship established prior to study commencement?	Page 7
7. Participant knowledge of the interviewer	What did the participants know about the researcher? e.g. personal goals, reasons for doing the research	Supplementary files, participant information and consent forms, page 10
8. Interviewer characteristics	What characteristics were reported about the interviewer/facilitator? e.g. Bias, assumptions, reasons and interests in the research topic	Page 10
Domain 2: study design		
Theoretical framework		

9. Methodological orientation and Theory	What methodological orientation was stated to underpin the study? e.g. grounded theory, discourse analysis, ethnography, phenomenology, content analysis	Page 13
Participant selection		
10. Sampling	How were participants selected? e.g. purposive, convenience, consecutive, snowball	Page 8, 10
11. Method of approach	How were participants approached? e.g. face-to-face, telephone, mail, email	Page 8, 10
12. Sample size	How many participants were in the study?	Page 8, 10
13. Non-participation	How many people refused to participate or dropped out? Reasons?	Figure 1, page 8
14. Setting	Setting of data collection Where was the data collected? e.g. home, clinic, workplace	Page 7-8
15. Presence of non-participants	Was anyone else present besides the participants and researchers?	Page 11
16. Description of sample	What are the important characteristics of the sample? e.g. demographic data, date	Table 2, page 12
Data collection		
17. Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	Appendix B, Appendix C
18. Repeat interviews	Were repeat interviews carried out? If yes, how many?	NA
19. Audio/visual recording	Did the research use audio or visual recording to collect the data?	Page 10
20. Field notes	Were field notes made during and/or after the interview or focus group?	Page 10
21. Duration	What was the duration of the interviews or focus group?	Page 11

22. Data saturation	Was data saturation discussed?	Page 5
23. Transcripts returned	Were transcripts returned to participants for comment and/or correction?	No
Domain 3: analysis and findings		
Data analysis		
24. Number of data coders	How many data coders coded the data?	Page 13
25. Description of the coding tree	Did authors provide a description of the coding tree?	Figure 2
26. Derivation of themes	Were themes identified in advance or derived from the data?	Page 13
27. Software	What software, if applicable, was used to manage the data?	Page 13
28. Participant checking	Did participants provide feedback on the findings?	Page 13
Reporting		
29. Quotations presented	Were participant quotations presented to illustrate the themes / findings? Was each quotation identified? e.g. participant number	Page 14-20
30. Data and findings consistent	Was there consistency between the data presented and the findings?	Page 14-20
31. Clarity of major themes	Were major themes clearly presented in the findings?	Figure 2
32. Clarity of minor themes	Is there a description of diverse cases or discussion of minor themes?	Page 14-20

Investigating Communication Enhanced Environments after stroke: Staff focus group guide

What kind of language activities or language tasks do patients following stroke currently participate in on the ward?

What kind of language activities or language tasks would you like see patients following stroke have access to on the wards?

Describe your experience of communicating with patients following stroke at the moment.

Can you tell me about anything that facilitates your ability to communicate with patients following stroke on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with patients following stroke on the ward?

What changes would you like to see to enhance communication between staff and patients following stroke on the ward?

What changes would you like to see to enhance communication between visitors and patients following stroke on the ward?

How could we enhance or optimise communication and language tasks and activities for patients following stroke on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

Appendix C.**Investigating Communication Enhanced Environments after stroke: Patient interview guide**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

1 Abbreviations and Definitions of Terms

CEE model: Communication Enhanced Environment model, an adapted model of an Enriched Environment, an environment that provides stroke patients opportunities to engage in language activities during inpatient rehabilitation.

PWA: Patients following stroke with aphasia.

PWOA: Patients following stroke without aphasia.

Language activities: Language tasks that consist of solitary or interactive language activities.

Solitary language activities: Activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications.

Interactive language activities: activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

EE: Enriched Environment, an environment that promotes physical, cognitive and social activity.

2. Protocol Synopsis

<p>Study Title:</p>	<p>Investigating a Communication Enhanced Environment model on acute and rehabilitation wards early after stroke: A before-after non-randomised controlled pilot study</p>
<p>Study type:</p>	<p>Interventional</p>
<p>Study Intervention:</p>	<p>A Communication Enhanced Environment (CEE) model will be developed from pre-intervention observations of inpatient language activities and investigations of barriers and facilitators to communication together through focus groups with hospital staff and interviews with patients on the acute and rehabilitation wards.</p> <p>Sixteen patients following stroke will be recruited in this prospective before-after non-randomised controlled pilot study set in an acute and a rehabilitation ward of a metropolitan private hospital. The study includes: i) The baseline phase which involves observation of patients following stroke (n=8, 4 patients with aphasia (PWA) and 4 patients without aphasia (PWOA)); the collection of qualitative data through focus groups and semi-structured interviews to determine patient and staff perceived barriers and facilitators to communication; ii) the implementation phase where a CEE model will be developed and embedded in usual care; iii) the post-implementation phase which will involve repeated baseline data collection on a different cohort of patients (n=8, 4 PWA and 4 PWOA) to determine i) how solitary and interactive language activity levels changed following implementation of the CEE model, ii) the differences post CEE implementation in hospital staff's use of communication promoting strategies when interacting with patients, iii) the differences post CEE implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>The CEE model will include the provision of:</p> <p>i) CEE model equipment, for example reading materials such as books and magazines, and access and encouragement to reside in a communal dining area;</p> <p>ii) CEE model education, support and training for staff with the aim to develop the ability to facilitate language activities for patients after stroke. The training program will be guided by research evidence, expert opinion and baseline data. Staff will complete a questionnaire pre and post training to determine changes in their knowledge, skills and attitudes regarding communication and aphasia.</p> <p>Control treatment: Patients following stroke with and without aphasia will be observed and video recorded over two week days and one weekend day pre (n=8) and post (n=8) implementation of a CEE model. Behavioural mapping will record patient interactive and solitary language activity observed within the first minute of 5-minute intervals in 4-hour time periods between 7am and 7pm. <i>Solitary language activities</i> are activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications. <i>Interactive language activities</i> are activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.</p>

<p>Objectives of the Study:</p>	<p>This study aims to investigate a CEE model on an acute and rehabilitation ward and if stakeholders perceive a CEE model as valuable by addressing the following research questions:</p> <ul style="list-style-type: none"> - Does a CEE model increase the amount of time PWA and PWOA spend in participating in solitary and interactive language activities on acute and rehabilitation wards during the early post-stroke period? - What are the differences in patients' experience of communication in a CEE model compared to patients' experience of communication in a standard environment on in-patient acute and rehabilitation wards? - What is the experience of implementing a CEE model for staff working with PWA and PWOA within in-patient acute and rehabilitation wards? - Do staffs' perceptions of their knowledge of, skills with, and attitude towards communication and aphasia change following implementation of a CEE model?
<p>Number of Centres:</p>	<p>1</p>
<p>Study duration:</p>	<p>5 years</p>
<p>Study Hypothesis:</p>	<p>A CEE model will increase patient engagement in solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.</p>
<p>Primary outcomes:</p>	<p>The primary outcome is the change in the proportion of solitary and interactive language activities as a percentage of total observed activity after the implementation of the CEE model.</p> <p>Timepoint: Patient observations completed within 21 days post stroke.</p>
<p>Secondary outcomes:</p>	<p>The differences post CEE model implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>Timepoint: Within 18 months of embedding the CEE model.</p>
<p>Study design:</p>	<p>Before-after non-randomised pilot study</p>
<p>Key inclusion criteria:</p>	<p>Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a stroke, less than 21 days post stroke during baseline phase or post-implementation phase, the ability to provide informed consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening, an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below 93.7 on the Western Aphasia Battery-Revised.²</p> <p>Staff participants: One representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.</p>
<p>Key exclusion criteria:</p>	<p>Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at the time of acute admission or are a participant in another research trial which may affect this study's outcome measures.</p>
<p>Study Procedures:</p>	<p>Baseline phase: Eligible patients during the baseline phase will be observed and video recorded for 4 hours on 3 consecutive days (one weekend and two weekdays) and will complete a semi-structured interview to explore their experiences of communication, and their perceptions of barriers and facilitators to inpatient language activities during their inpatient admission.</p>

	<p>Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to inpatient language activities. A focus group interview schedule will be used across all focus groups.</p> <p>Implementation phase: The CEE model will be implemented within the acute and rehabilitation wards.</p> <p>Post-implementation phase: Intervention group patient observations and interviews, and staff focus groups will replicate baseline data collection.</p>
Safety parameters	<p>Patients and/or their significant others may experience increased levels of distress during recruitment and/or data collection. This may be the result of adjustment following stroke and/or diagnosis of aphasia and increased awareness of impairment. No other risks known regarding participation in this project. The baseline assessments and interview will be conducted by the Chief Investigator who has experience in supporting patients during this early stage of stroke recovery. If a patient or any significant others becomes upset or distressed, the assessment or interview will be paused with the option to discontinue and counselling strategies will be provided.</p>
Statistical methods /analysis	<p>Patient demographic and stroke characteristics will be presented using descriptive statistics. One-way ANOVA or the Kruskal-Wallis and chi-square tests will examine differences in characteristics between groups. Time spent observed in interactive and solitary language activities will be expressed as a percentage of total observations. A mixed design ANOVA will be used to calculate the within-subjects variable of presence of aphasia and the between-subjects variable of a CEE on language activity levels of patients by comparing baseline to intervention phase observations. A qualitative description research approach will be used for the qualitative component of this research. The mixed methods design will enable the triangulation of the qualitative and quantitative data.</p>
Sample size determination:	<p>The patient sample size was selected for this pilot study to collect data across each observation period for each patient group in the baseline and intervention phases (see document: Observation_protocol_SD_version 3_23-02-16). The sample size for staff participants was selected to capture a sufficient breadth of professional perspectives.</p>

3. Introduction

Aphasia is an acquired communication disorder that affects approximately 30% of first ever ischaemic stroke survivors³ and persists in up to 61% of survivors one-year post stroke.⁴ Aphasia impacts all communication modalities with significant negative consequences for social participation, interpersonal relationships, autonomy, capacity to work and quality of life.⁵

Patients following stroke with aphasia (PWA) have been observed to spend less than 28% of their day communicating and 44% of their day alone during their first weeks of inpatient rehabilitation.⁶ Inadequate opportunities for communication places PWA at risk of developing maladaptive behaviours such as learned non-use of language.⁷

Environmental Enrichment (EE) refers to conditions which promote physical, cognitive and social activity and has been shown in animal models of stroke to enhance neuroplasticity⁸, promote better learning and memory and contribute to significant improvements in motor function.⁹ The human equivalent model¹⁰ in a rehabilitation unit results in patients spending more time engaged in activity and less time sleeping and alone.¹¹

4. Objectives

Aphasia is a complex language impairment and PWA may need additional support within an Enriched Environment. This pilot study seeks to develop and test an adapted model of an Enriched Environment, a Communication Enhanced Environment (CEE), as a strategy to provide PWA and patients following stroke without aphasia (PWOA) more opportunities to engage in language activities during inpatient rehabilitation. Within this study language activities include both *solitary activities* that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications, and *interactive activities* which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

4.1 Hypotheses

A CEE will increase patient solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.

5. Study design

This mixed methods pilot study is a prospective before-after non-randomised controlled design in an acute and a rehabilitation ward of a metropolitan private hospital. The study involves three phases:

- i) *Baseline*: observe and quantify the current ward environment;
- ii) *Implementation* of the CEE model;
- iii) *Post-implementation*: assess the impact of the CEE model.

6. Study Population

- i) *Patients*: The baseline group (n=8, 4 PWA, 4 PWOA) recruited within the baseline phase, and the intervention group (n=8, 4 PWA, 4 PWOA) recruited during the post-implementation phase.

- 1 ii) *Staff participants*: One representative from each acute and rehabilitation staff group including medical,
2 nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.

3 **6.1 inclusion and exclusion criteria**

4 Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a
5 stroke, less than 21 days post stroke during baseline phase or intervention phase, the ability to provide informed
6 consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening,
7 an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-
8 structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below
9 93.7 on the Western Aphasia Battery-Revised.²

10 Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented
11 diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at
12 the time of acute admission or are a participant in another research trial which may affect any of this study's
13 outcome measures.

14 Staff and volunteers who are over 18 years old will be eligible to participate in this study.

15 **7. Study Assessments and Procedures**

16 **Baseline**

17 All recruited patients will complete the Montreal Cognitive Assessment,¹¹ and The NIH Stroke Scale.¹² PWA
18 will also complete the Western Aphasia Battery-Revised.² Patients' behaviour will be observed and video recorded
19 for four hours per day on a Sunday, Monday and Tuesday between 7am to 7pm. A behaviour mapping tool
20 (Appendix A) developed for this study will record patient engagement in language activities in the first minute of
21 each five-minute interval across each four-hour observation period. Semi-structured interviews will explore patients'
22 perceptions of barriers and facilitators to inpatient language activities. An interview schedule will be used across all
23 interviews (Appendix B.). Supportive communication strategies will be used to facilitate PWA participation in
24 interviews with transcriptions annotated to capture any non-verbal responses.

25 Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to
26 inpatient language activities. A focus group/interview schedule (Appendix C.) will be used across all focus groups.

27 **Implementation**

28 The CEE model will be implemented within the acute and rehabilitation wards.

29 **Post implementation**

30 Intervention group patient observations and interviews, and staff focus groups will replicate baseline data
31 collection.

32 **8. Study Treatment**

33 The CEE model incorporates the following strategies to encourage engagement in language activities:

- 34 i) Staff training to facilitate patients' communication and provide opportunities to engage in language
35 activities;
- 36 ii) Patient access to:

- a) Communication enhancement resources such as iPads and audiobooks;
- b) Communal areas to facilitate engagement amongst patients.

9. Participant Completion and Discontinuation

9.1 Participant Completion

Participants will have completed the study when they have completed the semi-structured interview.

9.2 Participant withdrawal

Participation in this study is voluntary. The participant can withdraw from taking part in the study at any time without giving a reason for withdrawing.

10. Data analysis

10.1 Primary Analysis

The proportion of observed episodes where PWA and PWOA are engaged in language activities at baseline and post implementation will be analysed using a mixed design ANOVA.

10.2 Secondary Analysis

The differences in staff and patient perceptions of the barriers and facilitators to inpatient language activities and communication post CEE implementation will be analysed through a qualitative description approach. Triangulation of the qualitative and quantitative data will be conducted.

11. Data management

The data collected will be confidential. No identifying information will be attached to the data and any information that may reveal participant's identity will be removed. The master list of participant names and codes will be kept in a locked filing cabinet at the hospital site which will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The de-identified data will be stored on a password-controlled computer and/or in a locked cabinet at Edith Cowan University. Electronic data will be backed up on a password controlled hard drive only accessible by the Chief Investigator.

The data collected from this study will have a significant contribution to the aphasia research area and therefore will be stored for 15 years following the completion of this study. Data may be accessed for future studies by the study investigators or higher degrees by research (HDR). In the case of HDR use of the data, the use of the data will be bound by a two-way confidentiality agreement. The data may be used for teaching purposes only with the additional written permission from participants. The data may be made accessible to consumer groups (for example the Australian Aphasia Association) and information may be made available through the National Stroke Foundation and scientific journals. Confidentiality will be maintained in all circumstances. Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data are only used for approved purposes. Researchers who access this data from the data bank will not have access to the participant keys that attach participants to codes therefore data will only be re-identifiable by the Chief Investigator. Data will be deleted from electronic storage and hard copy data will be shredded by the chief

investigator after 15 years completion of the research study (with Ethics Committee approval, Ethics approval numbers: HPH431 and ECU HREC 12149). Non-identifiable data will be added to data archives for data sharing. Researchers who access data archives will not have access to information attaching participants to coded data.

12. Study Report

This study will be published in a PhD thesis as part of the Chief Investigator's Higher Research Degree. Outcomes from this study will be published in peer review journals and at conferences.

13. Administration Procedures

13.1 Ethical Considerations

This research is likely to have a significant impact on aphasia recovery following stroke and will form the basis for future study designs. This study will develop a teaching and learning package that can be used in the future to facilitate and promote increased levels of communication activity during early stroke recovery. The implementation of a CEE may address missed opportunities for language stimulation, harness increased levels of neuroplasticity and optimise aphasia language recovery after stroke. The benefit of a CEE may extend beyond patients with aphasia and may improve health care experience and communication access for all patients following stroke. Additionally, these benefits may extend beyond patients involved in the study as trained staff may use skills and knowledge obtained in the training program to enhance the communication environment of all patients they care for.

13.2 Ethical Review Committee

All processes and documentation used within this study will be reviewed and approved by the Edith Cowan University Research Ethics Committee and the site Ethics Committee. The Chief Investigator will complete the annual ethics reports and will be responsible for reporting any adverse events to the Ethics Committees.

13.3 Informed Consent

Participants will be excluded if they do not have adequate English proficiency to participate in semi-structured interviews and focus groups. Any participants that require an interpreter will be excluded from inclusion in this study as determined by the medical team.

Patients with aphasia will be provided with aphasia friendly information sheets and consent forms with simple language, bold key words and pictorial support. This will be read and explained by the researcher. Supported conversation strategies will be used to support and facilitate patients with aphasia's involvement and understanding of the research process, informed consent and their rights to withdraw at any time. This will be provided by the Chief Investigator who is a qualified speech pathologist with experience in communicating with patients with aphasia using supported conversation techniques to facilitate and support communication. A detailed information will also be provided to the 'person responsible' for all patients.

13.4 Protocol Amendments

All protocol amendments will be reviewed and accepted by the Edith Cowan University Research Ethics Committee and the site research Ethics Committee.

Appendix B. Patient interview guide

Investigating Communication Enhanced Environments after stroke**Patient Interview guide, version 1_11-8-15**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

For peer review only

Appendix C. Staff focus group guide.

Investigating Communication Enhanced Environments after stroke
Staff focus group guide, version 1_27-7-15

STAFF FOCUS GROUP GUIDE BASELINE PHASE

What kind of language activities or language tasks do stroke patients currently participate in on the ward?

What kind of language activities or language tasks would you like see stroke patients have access to on the wards?

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about anything that facilitates your ability to communicate with stroke patients on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

What changes would you like to see to enhance communication between staff and stroke patients on the ward?

What changes would you like to see to enhance communication between visitors and stroke patients on the ward?

How could we enhance or optimise communication and language tasks and activities for stroke patients on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

STAFF FOCUS GROUP GUIDE POST-IMPLEMENTATION PHASE

Describe your experience of communicating with stroke patients at the moment.

Can you tell me about any barriers you experience that impact your ability to communicate with stroke patients on the ward?

Describe the differences in the communication environment since implementing the model.

What changes did you see to enhance communication between staff and stroke patients on the ward?

What changes did you see to enhance communication between visitors and stroke patients on the ward?

What was it like to use the model?

How do you feel about the model?

Can you tell me about anything that helped you use the model with stroke patients on the ward?

Can you tell me about any barriers you experienced while implementing the model?

How can we improve the model?

Communication Enhanced Environments after Stroke

Study procedure version 2_23-02-16

BASELINE:

Staff recruitment: The Chief Investigator will recruit staff participants through a verbal explanation of the study and the provision of the information sheets and written consent forms. Staff will be provided 48 hours to discuss the study and ask questions before consenting to participate. Staff interviews and focus groups will commence as staff participants are recruited. Staff will participate in a one-hour focus group or a one-hour semi-structured interview (in person or via telephone) to explore staff perceptions of environmental barriers and facilitators to language activity and communication on in-patient acute and rehabilitation wards.

Patient recruitment: All consecutively admitted patients following stroke during the baseline period will be screened for eligibility to participate in the study. The hospital site investigators will identify potential stroke participants that meet the inclusion and exclusion criteria. Stroke participants with aphasia will be identified by the hospital speech pathology or medical team as having a diagnosis of aphasia (aphasia diagnosis will be confirmed via Western Aphasia Battery-Revised (WAB-R)¹ Aphasia Quotient score <93.7 during data collection). The site investigators will approach potential participants and gain verbal consent from the patient to be approached by a member of the research team and have their 3-point identification released to the research team. This will be documented in the patient's integrated medical progress notes. Once verbal consent has been gained and documented, the site investigators will email the Chief Investigator the patient alert proforma identifying the patient as meeting the inclusion/exclusion criteria. The research team will liaise with the medical team to confirm the potential stroke participant meets the inclusion criteria: (i) admitted to the in-patient rehabilitation stroke unit for recent stroke, (ii) are less than 21 days post stroke and during baseline phase or intervention phase, (iii) have the ability to provide informed consent as determined by the medical team iv) Glasgow Coma Scale² greater than 10 at the time of screening, (v) have an estimated length of stay greater than 14 days and (vi) have adequate English proficiency to participate in semi-structured interviews. Patients will be excluded if they (i) have uncorrected hearing or vision (for example hearing impairment without hearing aids, vision impairment without glasses), (ii) are not medically stable, (iii) have a documented diagnosis of major depression or (iv) have a documented history of dementia or significant cognitive decline, traumatic brain injury or previous aphasia at the time of admission for the acute event, (v) or are a participant in a research study that will influence this study's outcomes. Stroke participant recruitment will follow the stroke participant consent procedure (see document: SD_Communication Enhanced Environments after Stroke consent procedure version 1_3-2-15). A record of identifying participant details attached to patient codes will be kept at the hospital site in a locked filing cabinet. An email summary of the baseline assessment results will be sent to the hospital speech pathology generic email address. The patient will be identified by patient code and ward/room number. The hospital speech pathology team will write a summary of the assessment results in the patient's integrated medical progress notes.

Patient data collection: All recruited stroke participants will complete the NIH Stroke Scale³ (by someone trained in using this tool) and the Montreal Cognitive Assessment (MoCA).⁴ Participants with aphasia will also complete an assessment of aphasia, the WAB-R¹ and provide a personal narrative language sample on their reason for admission to confirm a diagnosis of aphasia. After patient recruitment has been completed, the Chief Investigator and/or trained medical team members will recruit the patient's family, friends and significant others to consent to video recording and observations of their interactions with stroke participants.

Observations of stroke participants will commence 1-3 days after obtaining written consent. Patients' behaviour will be observed by the Chief Investigator or a Research Assistant, and video recorded for a total of 12 hours to enable behaviour mapping of video data (see document: Observation_protocol_SD_version 3_23-02-16). Patients will be observed and video recorded for 4 hours per day on weekend day and two consecutive weekdays between 7am to 7pm. The observation periods will be grouped into 4-hour observation intervals (e.g. 7am-11am, 11am-3pm and 3pm-7pm). Each day the patient will be observed and video recorded for one observation interval. The participant will be observed and video recorded during a different observation interval each day to gain a general insight into the patients' activities (see Figure 1. below). Patients who do not consent to video recording will be provided with the option of audio recording and manual observation conducted by the researcher to enable the collection of case notes regarding patient behaviour. An observational protocol developed for this study will be used to measure the frequency stroke participants engage in language activities. These will be categorised into *solitary language activities* for example reading, writing, listening to the radio, use of iPad applications, and *interactive language activities* defined as i) an interaction involving an exchange of information, ii) with a communication partner including gesture and/or facial expression, reading, writing or drawing for the purpose of communication and use of technology including talking on the telephone. The observational protocol will be based on the behavioural mapping techniques of Janssen et al.⁵ Patients' solitary and interactive language activities will be recorded in 5-minute intervals and activity observed within the first minute of the observation interval will be recorded on a checklist of the predetermined behaviours. Semi-structured supported conversation interviews for stroke participants will be conducted within 5 days of the last observation. The interviews will explore patients' perceptions of environmental barriers and facilitators to language activities and communication and their experience of communication on the acute and rehabilitation wards.

IMPLEMENTATION:

A model of a CEE will be implemented within the acute and rehabilitation wards. The model will be developed as part of the research project. We hypothesise that our model of CEE will include the provision of:

- i) CEE equipment, for example reading materials such as books and magazines, access to a computer with internet and access to a communal dining area,
- ii) CEE education, support and training for staff, patients and their family, friends and significant others with the aim to develop the ability to support and facilitate 'language activity' and 'communication activity' for patients after stroke. This will be accessible via multiple modalities including one-on-one training and group training sessions, as

well as through the provision of video and written resources. A questionnaire will be administered pre and post training in order to determine staffs’ perceptions of changes in their knowledge, skills and attitude towards communication and aphasia. Additionally, feedback regarding the content and format of the training program will be obtained through questionnaires administered after the completion of the training program. Training and support provided in the implementation phase will be continued until the end of the intervention phase.

POST-IMPLEMENTATION:

Staff participant semi-structured interviews and focus groups will be conducted. Staff will participate in a one-hour semi-structured interview or a one-hour focus group to explore staff perceptions of environmental barriers and facilitators to language activities and communication.

The procedures for participant recruitment and data collection during the post-implementation phase will replicate those used in the baseline phase.

There is no travel commitment for all participants as all data collection and training will be conducted at the hospital.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday

Communication Enhanced Environments after Stroke consent procedure

Version 1_3-2-15

Stroke participants

The following consenting procedure will be used for all participants who are identified as potential research participants. Recruitment will only be completed by the Chief Investigator.

1. Check the stroke participant meets the inclusion criteria and exclusion criteria.
2. Read the participant information sheet to the participant. Use the pictures on the participant consent form to support the patient's comprehension of verbal information. Use gesture, written and pictorial support to facilitate verbal communication as required.
3. Provide the person responsible with the person responsible information sheet and consent form.
4. Provide time for the patient and the person responsible to discuss the study and ask questions to their satisfaction.
5. Ask the stroke participant if they consent to the study using simple closed questions (e.g. "Do you understand what the study is about?", "Do you have any questions about the study?", "Do you want to be in the study?", "Will you sign the form?"). Use multi-modal communication strategies and repeat information/questions as required. Use the pictures on the participant consent form to support patient comprehension of verbal information.
6. If the stroke patient agrees to participate in the study, ensure they sign the consent form witnessed by someone independent of the study.
7. Provide the stroke participant with a copy of the information sheet and consent form for their own records.
8. Add the participant study number to the consent form
9. Store the signed consent forms in a locked cabinet at the hospital site. This cabinet will only be accessible by the research investigators.

Investigating Communication Enhanced Environments after stroke

Observation Protocol version 3_ 23-2-16

During the baseline and intervention period, patients' behaviour will be observed and video recorded for a total of 12 hours. Patients who do not consent to video recording will be provided with the option of audio recording and manual observation. This will enable the collection of relevant notes about factors that might influence the interactions that may not be captured in the video or behavioural mapping, for example the context of the interactions or details about the environment.

Patients will be manually observed and video recorded for four hours per day on two weekdays and one weekend day between 7am to 7pm. The observations will be grouped into three x 4-hour observation intervals (e.g. 7am-11am, 11am-3pm, 3pm-7pm). Each day the patient will be observed and video recorded for one of the 4-hour observation intervals. The 4-hour observation period will be split into 5-minute intervals. All language and communication activity observed within the first minute of the 5-minute interval will be recorded on the behavioural mapping sheet with predetermined behaviours (Appendix 1). The free smart phone app 'Impetus' can be used to time 1-minute observations. You can set the timer to vibrate briefly when the 1-minute observation interval begins and ends.

Observation times (see Figure 1.) will be randomly selected by drawing out of an envelope. This will be conducted by the primary investigator prior to commencing patient observations. It may not be possible to observe the patient during the planned observation time, for example as a result of scheduled testing or home visits. If this occurs, patients can be observed during the next available observation interval. Changing or modifying the observation schedule should be avoided where possible.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday
1	7am-8am	*PWA1	PWA3	PWA2
	8am-9am	**PWOA1	PWOA3	PWOA2
	9am-10am			
	10am-11am			
2	11am-12pm	PWA2	PWA1	PWA3
	12pm-1pm	PWOA2	PWOA1	PWOA3
	1pm-2pm			
	2pm-3pm			
3	3pm-4pm	PWA3	PWA2	PWA1
	4pm-5pm	PWOA3	PWOA2	PWOA1
	5pm-6pm			
	6pm-7pm			

Figure 1. Observation schedule

*PWA: patient with aphasia

**PWOA: patient without aphasia

DISCOURSE SAMPLE

You must collect a personal narrative discourse sample for each participant at the beginning of the first observation. Once you have set up the video camera and have started recording, ask the patient “what has brought you into hospital?”. Once the patient has finished telling you their personal narrative, tell the patient you will now start the observations.

VIDEO RECORDING SET-UP

Place the video camera facing the patient approximately 1-2 metres away from them. Ensure the camera is placed in an area where it is unlikely to be moved for the duration of the observation time (for example at the end of the patient’s bed). Ensure the camera frame is capturing the patient as well as their surroundings (e.g. potential communication partners, visitors, etc). If the patient relocates, reposition the camera to ensure the patient and their surroundings remain in frame. Observe and manually record the patient’s behaviour and their environment according to the procedure for behavioural mapping.

Do not record the patient in the bathroom or shower or during any other inappropriate circumstances (this may include sensitive conversations, culturally sensitive situations or if the patient requests). If the patient indicates that they don’t want to be recorded or becomes agitated, upset or distressed, use the ‘withdrawal from observations visual resource’ (if appropriate) and ask the patient:

1. Do they want you to stop video recording?
2. Do they want to be manually observed and audio recorded instead?
If the patient responds ‘no’, ask the patient-
3. Can you come back another time to observe them?

If the patient asks you to stop recording you must cease recording immediately. The patient may allow you to continue with manual observations or come back another time to complete the observations. If the patient allows you to complete manual observations and audio recording, follow the audio-recording set-up and protocol below.

AUDIO RECORDING SET-UP AND PROTOCOL

This protocol is to be followed if the patient or their family indicate they do not want to be video recorded however agree to audio recording and manual observations. Place the cap on the video camera and continue recording in order to capture audio. If using a battery-operated audio recorder, place it on a table close to the patient (within 1 metre). Ensure the audio recorder is placed in a location where it will not be touched or moved throughout the

1 observation time. Observe and manually record the patient's behaviour and their environment according to the
2 procedure for behavioural mapping. Ensure spare batteries for the audio recorder are available if required.
3
4
5

6 **COMMUNICATION PARTNERS AND VISITORS**

7
8 Take note of all communication partners and visitors who have provided consent to video recording and/or
9 observations of their patient interactions. If someone enters the room during recording politely interrupt the
10 interaction, introduce yourself and inform the person that the patient is being video recorder recorded as a part of
11 the study the patient has agreed to participate in. Ask the visitor if they would like to go out of the room with the
12 researcher to find out about the study and the video recording. Provide a verbal explanation of the study and
13 provide the 'Visitors/communication partners' information and consent form'. Offer the visitor the option of no
14 video or manual recoding during their interaction with the patient. If the person chooses not to participate in
15 manual or video observations inform the person that any incidental recordings of them will be deleted and will not
16 be included in the study. The researcher will step out of the room for the duration of their visit.
17
18
19
20
21
22
23
24
25

26 **PROCEDURE FOR BEHAVIOURAL MAPPING**

- 27 • Position self where the patient can be clearly observed
- 28 • Remain inconspicuous as possible
- 29 • Circle ALL appropriate components on the observation schedule in regards to location, activity, people
30 present and details of language and communication observed within the first minute of each five-minute
31 interval.
- 32 • You can circle more than one key per section if required (except for location).
- 33 • If you require a toilet break, leave the camera recording while you take a break. If you miss a 1-minute
34 observation, place a line through the observation interval on the behavioural mapping sheet and write
35 'unobserved-toilet break'.
36
37
38
39
40
41
42
43
44
45

46 **TIME**

- 47 • Write the time at the beginning of the 1-minute observation interval

48 **LOCATION**

- 49 • Circle only one location
- 50 • If the patient is moving between two locations, circle the location the patient is moving towards

51 AMENITIES: Toilet, shower.

52 BEDROOM: Around the patient's room or bed. If the patient is outside of their doorway this is considered 'hall'.
53
54
55
56
57
58
59
60

1 HALL: Any hallway within the hospital ward.

2 THERAPY AREA: In an allied health therapy session, including occupational therapy, physiotherapy, speech
3 pathology, nursing.

4 FAMILY MEETING ROOM: Family meeting room.

5 DOCTOR'S ROOM: Doctor's office.

6 DINING ROOM: Dining room during meal times or any other time.

7 COMMUNAL AREA: Communal dining area.

8 OUTSIDE: Outside areas including the garden, car park.

9 OFF UNIT: Off-site locations, home visits, testing off site.

10 OTHER: Anything that doesn't fit into the above categories-provide description of location.

11 PEOPLE PRESENT

12 People present include any person that is near the patient and is able to have an interaction with the patient. If you
13 do not know how to classify the person make a note to check with staff at a later time and complete the observation
14 schedule.

15 **Exceptions:** People who are near the patient but are unable to interact with the patient, e.g. cognitive or behavioural
16 issues, barriers between person and the patient preventing them from interacting- e.g. curtain drawn, people in the
17 way. If an interaction is occurring despite objects in the way, the communication partner is considered as a 'person
18 present'.

19 PEOPLE PRESENT: Nurse, nurse assistant, doctor, physio (physiotherapist), OT (occupational therapist), SP (speech
20 pathologist), DT (dietician), SW (social worker), family/friend, other patient, alone (no-one present that is conducive
21 to interactions), other (describe).

22 ACTIVITIES

23 UNOBSERVED: If you are unable to observe the patient. Place a line through the observation
24 interval and write unobserved.

25 NO LANGUAGE ACTIVITY: If the patient is observed not engaged in any communication activity.

- 26 • Circle 'no activity' on the checklist
- 27 • Write what the patient is doing, e.g. 'sleeping'

28 INTERACTIVE LANGUAGE ACTIVITIES: Defined as an interaction involving an immediate communicative exchange
29 with a communication partner. Interactive language activities may include talking, gesture and/or facial expression,
30 reading, writing or drawing for the purpose of communication, use of communication aids or AAC devices and use of
31 technology including talking on the telephone. Non-verbal gesture or facial expression includes eye contact to

1 initiate interactions, hand gestures (e.g. waving, thumbs up), body movements for the purpose of conveying a
2 communicative message (e.g. shrugging) and/or facial expressions for the purpose of communication.

3 Communication aids or AAC devices includes any use of alternative and augmentative devices for the purpose of
4 communication, e.g. high-tech or low-tech AAC devices such as letter boards, pictures/photos, whiteboard, writing
5 or drawing, smart phones, iPad. Please describe communication aids observed.
6
7

8
9 OTHER FUNCTIONAL COMMUNICATION ACTIVITIES: All other communication activities that do not involve a direct
10 immediate communicative exchange with a communication partner. Functional communication activity may include
11 reading, typing/writing, emailing, internet use, watching TV, listening to talking on the radio. Note the patient must
12 be looking directly at the TV to be considered 'watching TV'. If the TV is on in the background, do not include this as
13 'watching TV'.
14
15

16
17 NON-FUNCTIONAL/NON-PROPOSITIONAL LANGUAGE ACTIVITIES: Singing, word games (carried out alone), language
18 apps (used alone), copying written letters, words or sentences (carried out alone).
19
20

21 OTHER: Communication or language activities that do not fit the criteria of interactive language activity, 'other'
22 functional communication activities, non-functional/non-propositional language activities or may be a confounding
23 variable (for example, talking to self and talking to the observer). If a patient is talking to themselves, note if this is
24 appropriate (for example, saying 'excuse me' after burping) or inappropriate (for example, an extensive monologue)
25 and describe the context. If the patient's verbal output is inaudible, write this in the space underneath 'talking to
26 self'.
27
28
29
30
31

32 **Note:** If the patient is using a computer, phone, smart device, or iPad where the activity they are engaged in (e.g.
33 texting, emailing, playing a game, etc) cannot be accurately determined, note this in the comments section. After the
34 1-minute observation interval has been completed ask the patient if they mind sharing if what activity they were
35 completing on their device and record this in the relevant section. If the patient does not wish to share this
36 information with you, record this in the 'other' section.
37
38
39
40

41 COMMENTS

42 Describe the context of the interactions or details about the environment in the comments section. This will provide
43 information regarding factors that may influence the interactions, for example 'background noise'. Additionally,
44 write down any information that may be missed in the video data, for example, people out of the camera frame,
45 interactions that may be overheard in the room that might impact on the current interactions.
46
47
48
49

50 Draw a line under the final comment after the one-minute observation had been completed. Write any additional
51 observations within the final 4 minutes below this line (see example).
52
53
54
55

56 If you have any queries or questions regarding this observation protocol or the observation protocol please contact
57 chief investigator Sarah D'Souza.

9

10
11
12
13
14 This project is investigating the **hospital environment** to see how this
15 **influences** patient **communication activity**. Communication activity
16 involves communication, such as **talking** with other patients,
17 **socialising**, **reading** the paper, using the **telephone**, talking to staff, or
18 engaging in group activities including **therapy**.
19
20
21
22
23
24

25
26
27 **You** have been **selected** to participate as you have had a **stroke** and
28 are receiving **treatment at Hollywood Private Hospital**. We are
29 **interested** in seeing **how** the hospital **surroundings affect what you**
30 **do** throughout the day.
31
32
33
34
35
36
37

38 **What would you have to do?**

39
40 You will be **asked** to provide **consent** to **agree to participate** in the
41 study.
42
43
44

45 You will be **asked to consent** to:
46
47
48
49
50

- 51 • Complete **three tests** to see how your stroke has affected **you**
52 including your **language, concentration** and **memory**. These tests
53 will be conducted at the **beginning of the project**. The tests will take
54 approximately **1 hour** to complete with an option to complete the tests
55
56
57
58
59
60

1 over **two separate 30 minute sessions** and with as many **breaks** as
2 you may need.
3
4
5
6

- 7
- 8 • A **researcher** spending approximately **1 hour discussing with you**
9 your **opinion** regarding **how** your rehabilitation **surroundings affect**
10 **your stay in hospital** and **your communication activity** levels.
11
12
 - 13 • A researcher **video recording, observing** and **writing down** what is
14 happening in your **environment** including **your activities**. You will be
15 observed and recorded for a total of **12 hours** over **3 days**.
16
17

18
19
20
21
22
23
24
25
26 You may **not want** to be **video recorded**. If you **request**, you will
27 **not** be **video recorded**. You can ask not to be video recorded at **any**
28 **time**. In this case the researcher will **only observe, audio record**
29 and **write down** what is **happening in your** environment **including**
30 your activities.
31
32
33
34

2
3 If you decide to participate in this study, you **will not miss out** on any
4 **treatment**. Participation will **not cost** you **anything** and **after**
5
6
7 completing the **tests** and the **interview** you will be asked to continue
8
9 participating in your **normal activities**.
10

11
12
13
14
15 We will **not record** if you are **behind closed curtains** or completing
16
17 sensitive tasks such as when you are in the **toilet** or **shower**.
18
19

20
21
22
23 We may use the **recordings** of **you** to make a **training package**
24
25 (including a video). You can have **your face blurred out** if you want. If
26
27 you **do not want** to be in the training package we will **not include you**
28
29 in the training package or video.
30

31
32
33
34
35 Your hospital **discharge** will **not be affected** because you are in this
36
37 study. **You** will be **discharged** from hospital when the hospital **medical**
38
39 **team decides** that you are **ready**.
40

41
42
43
44 There are **no known risks** of participating in this study. If you feel
45
46 uncomfortable at any time, you are free to **tell the researcher** and
47
48 **observations** within your room will **stop immediately**. You may
49
50 become **upset** during the **tests** or the **interview**. If this happens you
51
52 can **ask** to take a **break or stop** the interview.
53
54

55
56
57 There will be **no immediate benefit** to you from participating in this
58
59 research; however your participation will allow the collection of
60

1 information that may **help improve** stroke **hospital wards** which may
2 **benefit** future stroke survivors.
3
4
5

6 **Participating** in this study is completely **voluntary**. You **do not have**
7 **to** participate if you don't want to. If you decide to participate you may
8 **withdraw** at **any time** without giving a reason and withdrawing **will not**
9 **disadvantage** you in any way and will **not affect** your hospital
10 **treatment**. If you **decide** that you do **not want to participate** in the
11 study, you **can ask to remove** all of your **information** from the study.

Person responsible information sheet
Stroke patients' communication activity in hospital

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccione	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

The participant is invited to take part in a research project. Sarah D'Souza, a Speech Pathologist and PhD student, is leading the study as Chief Investigator. This study has received ethical approval from ECU Human Research Ethics Committee and Hollywood Private Hospital Research Ethics Committee.

This project is investigating the hospital environment to see how this influences patient activity.

The participant has been selected to take part in this study as they have had a stroke and are receiving treatment at Hollywood Private Hospital. We are interested in

1 seeing how the hospital surroundings affect their communication activity throughout
2 the day. Communication activity involves communication, such as talking with other
3 patients, socialising, reading the paper, using the telephone, talking to staff, or
4 engaging group activities including therapy.
5
6
7
8

9 This information sheet will explain the research project and will detail what is involved in the
10 study. You will be given a copy of this information to keep for your reference.
11
12
13
14

15 Please read through all of the information carefully. You can ask the researcher questions
16 about the study at any time.
17
18
19
20
21

22 **Purpose of the research**

23
24 Little is known about the impact of the hospital rehabilitation environment on patient
25 communication activity levels during stroke recovery. This study will investigate how the
26 hospital stroke ward environment influences patient communication activity levels. The
27 information gathered from this study will assist in improving the Hollywood Private Hospital
28 stroke ward environment to help the recovery of stroke survivors in the future.
29
30
31
32
33
34

35 **What does the stroke patient have to do?**

- 36
37
38
39
40
- 41 • Complete three tests and a recording of them talking to see how their stroke has
42 affected their functioning including their language, concentration and memory. These
43 tests will be conducted at the beginning of the project. The tests will take
44 approximately 1 hour to complete with an option to complete the tests over two
45 separate 30 minute sessions and with as many breaks as the participant needs.
46
47
48
49
 - 50 • Spend approximately 1 hour discussing with the researcher their opinion regarding how
51 their rehabilitation surroundings affect their stay in hospital and activity levels.
52
53
54
55
 - 56 • Allow the researcher to video record, observe and write down what is happening in the
57 participant's environment including their activities for a total of 12 hours over a 3 day
58 period. Video recording is a useful way of capturing the details of everyday activities on
59
60

1 the ward. Often, people forget that the camera is there. Obviously, personal or private
2 activity such as toileting would not be filmed. The participant may not want to be video
3 recorded. If they request, they will not be video recorded. In this case the researcher
4 will only observe, audio record and write down what is happening in their environment
5 including their activities.
6
7
8
9

- 10
- 11 • A researcher will look at the participant's hospital medical file to collect information
12 regarding:
13
 - 14 • The participant's details (such as their age, living arrangements, occupation and
15 level of functioning before stroke)
 - 16 • Any relevant conditions or diseases the participant may have
 - 17 • Information about the participant's stroke (for example when it happened, the
18 area of the brain affected, how it has affected their functioning and abilities)
 - 19 • Details about how long the participant has been in hospital since their stroke
- 20
21
22
23
24
25

26 The participant will not miss out on any treatment. Participation will not cost anything. After
27 completing the tests and the interview the participant will be asked to continue their normal
28 activities.
29
30
31
32
33

34 The participant's hospital discharge will not be affected because they are in this study. The
35 participant will be discharged from hospital when the hospital medical team decides that they
36 are ready.
37
38
39
40
41

42 There are no known risks of participating in this study. If the participant feels uncomfortable
43 at any time, you or the participant are free to tell the researcher and observations within
44 their room will stop immediately. The participant may become upset during the tests or the
45 interview. If this happens you or the participant can ask to take a break or stop the interview.
46
47
48
49
50

51 There will be no immediate benefit to you or the participant from taking part in this research;
52 however **their participation will allow the collection of information that may help**
53 **improve stroke hospital wards which may benefit future stroke survivors.**
54
55
56
57
58
59
60

1 Participating in this study is completely voluntary. The participant can withdraw from taking
2 part in the study at any time without giving a reason for withdrawing.
3
4
5

6 The participant can request access to their research data at any time. They can request any
7 of the information collected to be amended or removed if it is incorrect or they disagree with
8 it. Please contact Sarah D'Souza (phone: 0439 982 451) if you would like to discuss
9 accessing the participant's information.
10
11
12
13
14
15

16 The video, audio and written data will be identified by code. The information you provide will
17 remain completely confidential. There will be no identifying information attached to the data
18 and any information that may reveal the participant's identity will be removed. A list of
19 participant names and codes will be kept in a locked filing cabinet at Hollywood Private
20 Hospital and will only be accessible by the research team. All personal health information will
21 be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will
22 be stored on a password controlled computer or in a locked cabinet at Edith Cowan
23 University. Electronic data will be backed-up on a password controlled hard drive only
24 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after
25 completion of the study. Video and audio recordings will then be permanently deleted and
26 hard copy data will be shredded.
27
28
29
30
31
32
33
34
35
36
37

38 Non-identifiable data will be accessible by researchers through data sharing archives. This
39 data will be governed by an overarching body to ensure data is only used for approved
40 research purposes. Researchers who access this data from the data bank will not have access
41 to participant information therefore data will not be re-identifiable.
42
43
44
45
46

47 The results of this study may be published in research journals or presented at conferences.
48 The results will not include any information that may identify participants. Data may be used
49 in higher degree by research studies in the future. In this circumstance, confidentiality will be
50 maintained and no identifying information will be used.
51
52
53
54
55
56

57 Data collected from this study (including videos) may be used to develop training packages to
58 improve future stroke survivors' communication activity levels in the future. We can blur out
59
60

1 the participant's face if they want. If they do not want to be in the training package we will
2 not include them in the training package.
3
4
5

6 At the end of the research project a summary of the results will be provided to you and the
7 participant.

Description of the research project

This study is exploring stroke patient's experiences in regards to the environment of an in-patient stroke rehabilitation unit. We want to explore stroke patient communication activity, which includes activities such as talking with other patients and visitors, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy.

The participant has agreed to take part in this study. They have agreed to be video recorded for a total of 12 hours over a three day period.

Your interactions with the patient will be video recorded and manually recorded by the chief investigator to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. You do not need to do anything other than complete your usual tasks and activities. We will not record if you are having sensitive conversations with the participant, if they are behind closed curtains or completing sensitive tasks such as toileting or showering.

1 We may use the recordings of you to make a training package (including a video). You can have your face
2 blurred if you want. If you do not want to be in the training package we will not include you in the training
3 package.
4

5
6
7
8 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
9 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
10 without giving a reason and withdrawing will not disadvantage you or the participant in any way.
11
12
13

14
15 You may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you
16 may not benefit from participating in this study. There are no known risks associated with participating in
17 this study.
18
19
20
21
22

23 **Confidentiality of information**

24
25 The video, audio and written data will be identified by code. There will be no identifying information
26 attached to the data and any information that may reveal your identity will be removed. A list of participant
27 names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be
28 accessible by the research team. All data will be accessed, used and stored in accordance with
29 Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked
30 cabinet at Edith Cowan University. Electronic data will be backed-up on password controlled hard drive only
31 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the
32 study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Investigating Enriched Environments after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is exploring staff and stroke patient's experiences in regards to the environment of the Edwards and Woods wards at Hollywood Private Hospital. We want to explore stroke patient communication activity, which includes activities such as talking with other patients, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy. We would like to explore staffs' perceptions of barriers and facilitators to communication activity on the wards and address these in order to enhance the ward environment.

Staff have been selected to participate in order to gain a range of perspectives in regards to the day to day operations, procedures, policies and interactions that influence the environment of the Edwards and Woods wards. A training program for staff will be designed to address barriers and facilitators identified on the wards.

There are two components of this research study that involve staff. You may wish to consent to participate in one or both parts of this study.

1
2
3 **Part 1:** Stroke in-patients will be video recorded for a total of 12 hours over a three day period. Your
4 interactions with the patient will be video recorded and manually recorded by a member of the research
5 team to explore patient communication activity levels. You can choose to be observed by the researcher
6 only if you do not want to be video recorded. You do not need to do anything other than complete your
7 usual daily tasks and activities. We will not record if you are behind closed curtains or completing sensitive
8 tasks such as toileting or showering the patient.
9
10
11
12
13
14

15 We may want use the recordings of you to make a training package (including a video). We will show you
16 the video we want to use and explain exactly how this will be used before we do anything. You can have
17 your face blurred out if you want. If you don't want to be included in the training package we will not include
18 any videos of you in the training package.
19
20
21
22
23

24 **Part 2:** You will be asked to take part in the following:
25

- 26 • A focus group with the researcher and your co-workers for approximately 1 hour to explore your
27 perceptions of environmental barriers and facilitators to activity.
- 28 • Attend a training program for approximately 1.5 hours. This will focus on training staff to promote
29 patient communication on the ward. This session will be located at Hollywood Private Hospital and
30 will be offered over several dates to facilitate your ability to attend. If you are unable to attend the
31 training program we may provide training and video resources to facilitate your participation in
32 training.
- 33 • Complete an anonymous short questionnaire before and after attending the training program to gain
34 feedback on training and explore your perception of changes in your knowledge, skills and attitudes
35 towards communication and aphasia.
- 36 • A final focus group with the researcher for approximately 1 hour to again explore your perceptions
37 of environmental barriers and facilitators to activity.

38 The focus groups will be tape recorded however at any stage you may ask for the tape to stopped,
39 edited or have your comments erased.
40
41
42
43
44
45
46
47
48
49
50

51 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
52 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
53 without giving a reason and withdrawing will not disadvantage you in any way.
54
55
56
57
58

59 You may benefit from gaining knowledge and skills regarding communication from attending the training
60 program. Additionally, you may also benefit from the knowledge that you are helping future stroke

1 survivors. It is possible that you may not benefit from participating in this study. There are no known risks
2 associated with participating in this study.
3
4
5

6 **Confidentiality of information** 7

8 The information you provide during the interviews will be audio recorded by the Chief Investigator. Your
9 perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'. This will be
10 used to inform the development and review of the training program.
11
12
13

14
15
16 The video, audio and written data will be identified by code. The information you provide will remain
17 completely confidential. There will be no identifying information attached to the data and any information
18 that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked
19 filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be
20 accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a
21 password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be
22 backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be
23 stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be
24 permanently deleted and hard copy data will be shredded.
25
26
27
28
29
30
31
32

33 Non-identifiable data will be accessible by researchers through data sharing archives. This data will be
34 governed by an overarching body to ensure data is only used for approved research purposes.
35 Researchers who access this data from the data bank will not have access to participant information
36 therefore data will not be re-identifiable.
37
38
39
40
41
42

43 The results of this study may be published in research journals or presented at conferences. The results
44 will not include any information that may identify participants. Data may be used in higher degree by
45 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
46 information will be used.
47
48
49
50

51 A summary of the results will be provided through Hollywood Private Hospital 18 months after the
52 completion of the study.
53
54
55
56

57 Please read this Information Statement and be sure you understand its content before you consent to take
58 part.
59
60

Description of the research project

This study is a Communication Enhanced Environment (CEE) at Hollywood Private Hospital. A CEE involves several initiatives that aim to provide more opportunities for communication for stroke survivors on the ward. One of these initiatives involves the participation of volunteers.

As a volunteer participant, you will be asked to take part in the following:

- Attend a training program for approximately 1.5 hours. This will focus on training volunteers in communicating with stroke patients with communication difficulties. This session will be located at Hollywood Private Hospital and will be offered over several dates to facilitate your ability to attend. If you are unable to attend the training program we may provide training and video resources to facilitate your participation in training.
- Complete an anonymous short questionnaire before and after attending the training program to obtain your feedback on the training session.

- A focus group with the researcher and other volunteers for approximately 1 hour to explore your perceptions of communicating with stroke patients. The focus group will be tape recorded however at any stage you may ask for the tape to stopped, edited or have your comments erased.
- Host a communal dining and lounge area once a week to offer tea and coffee and provide social companionship for stroke patients.
- Your interactions with the patient may be video recorded and manually recorded by a member of the research team to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. We will not record if you are having sensitive conversations with the stroke patient/s.

There will be no cost to you associated with participating in this study. Participation is completely voluntary. You do not have to participate if you don't want to. If you decide to participate you may withdraw at any time without giving a reason and withdrawing will not disadvantage you in any way.

You may benefit from gaining knowledge and skills regarding communication from attending the training program. Additionally, you may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you may not benefit from participating in this study. There are no known risks associated with participating in this study.

Abstract

Objectives: To explore barriers and facilitators to patient communication in an acute and rehabilitation ward setting from the perspectives of hospital staff, volunteers and patients following stroke.

Design: A qualitative descriptive study as part of a larger study which aimed to develop and test a Communication Enhanced Environment in an acute and a rehabilitation ward.

Setting: A metropolitan Australian private hospital.

Participants: Focus groups with acute and rehabilitation doctors, nurses, allied health staff and volunteers (n=51) and interviews with patients following stroke (n=7), including three with aphasia, were conducted.

Results: The key themes related to barriers and facilitators to communication, contained sub-categories related to hospital, staff and patient factors. Hospital related barriers to communication were private rooms, mixed wards, the physical hospital environment, hospital policies, the power imbalance between staff and patients, and task specific communication. Staff related barriers to communication were staff's perception of time pressures, underutilisation of available resources, staff individual factors such as personality, role perception and lack of knowledge and skills regarding communication strategies. The patient related barrier to communication involved patients' functional and medical status. Hospital related facilitators to communication were shared rooms/co-location of patients, visitors and volunteers. Staff related facilitators to communication were utilisation of resources, speech pathology support, staff knowledge and utilisation of communication strategies and individual staff factors such as personality. No patient related facilitators to communication were reported by staff, volunteers or patients.

Conclusions: Barriers and facilitators to communication appeared to be interconnected and likely to influence one another suggests communication access may vary between patients within the same setting. Practical changes may promote communication opportunities for patients in hospital early after stroke such as access to areas for patient co-location as well as areas for privacy, encouraging visitors, enhancing patient autonomy, and providing communication trained health staff and volunteers.

Study strengths

- This study involved a large number of staff in comparison to previous studies and included volunteers as well patients after stroke with and without aphasia.
- Data saturation was reached within the staff focus groups.

Study limitations

- The results in this study reflect the perceptions of a small number of medical (n=2) and nursing staff (n= 11) compared to allied health staff (N= 32).
- This study involved exploring the perceptions a small number of patients; a broader range of perspectives may have been expressed with a larger number of participants.
- This study was conducted at a private hospital involving a mixed acute and a mixed rehabilitation ward therefore these results reflect this context.

Background

Aphasia research supports the theory that commencing aphasia rehabilitation in the early phase post-stroke (<1-month post-stroke) results in better outcomes than therapy commenced in the chronic phase (>6-months post stroke).^{1,2} However, patients in hospital following stroke spend on average 50-94% of their day inactive.^{3,4} Despite improvements in functional independence during their hospital admission following stroke, patients' engagement in cognitive and social activity remains largely unchanged.⁵ Patients with aphasia spend two thirds less time engaged in social interactions with family and friends compared to those without aphasia.⁶ A lack of social and cognitive activity early after stroke for patients with aphasia has the potential to contribute to: i) the development of maladaptive compensatory communication behaviours, and ii) the learned non-use of language, which may ultimately impact on their quality of life and overall language recovery.⁶

Patients following stroke with and without aphasia have described time outside therapy as "dead" and "wasted", reporting a lack of stimulation and inactivity in hospital impacting their ability to self-direct their rehabilitation outside of therapy.⁷ They report the experience of boredom is worse in the evenings and weekends when there are less structured activities.⁸ They also perceive that boredom negatively influences their mood, motivation, and contributes to their experience of post-stroke fatigue.⁸ Boredom is associated with a loss of autonomy and sense of control and contributes to patients becoming passive recipients of care, which may have negative implications for stroke recovery.⁸

This study aimed to explore hospital staff and volunteer, and patient perceptions of barriers and facilitators to patient communication in an acute and a rehabilitation hospital ward. Identifying barriers and facilitators to patients' communication will inform the development of a Communication Enhanced Environment (CEE) model for the purposes of increasing their engagement in language activity within a hospital ward to maximise post-stroke aphasia language recovery.

Methods

Design

1
2
3 This study was part of a larger study which aimed to develop and test a CEE model
4 within an acute and a rehabilitation ward (see supplementary file for study protocol and
5 procedure). This study contributed to the baseline phase of the larger study outlined below:
6
7

- 8
9 *i) Baseline phase:* observe and quantify levels of engagement in language activity in the
10 acute and rehabilitation ward environment for patients following stroke, and explore
11 hospital staff, volunteers, and patients' perceptions of barriers and facilitators to
12 communication in hospital;
13
14
15
16 *ii) Implementation phase:* develop and implement the CEE model on the acute and
17 rehabilitation wards;
18
19
20 *iii) Post-implementation phase:* assess the impact of the CEE model on patient
21 engagement in language activity, and hospital staff, volunteers and patients'
22 perceptions of barriers to communication in hospital.
23
24

25 26 **Ethical approval**

27
28 This study has Ethics approval from the Edith Cowan University Human Research
29 Ethics Committee (ECU HREC 12149) and The Hollywood Private Hospital Research Ethics
30 Committee (HPH431).
31
32

33 34 **Reporting guidelines**

35
36 The consolidated criteria for reporting qualitative studies (COREQ)⁹ was used to
37 guide reporting this study (Appendix A.).
38
39

40 41 **Research authors' relationship with participants**

42 The first author who was external to the hospital conducted focus groups and
43 interviews. The first author engaged key hospital team members for the duration of the
44 study to inform the study design to ensure it aligned with the hospital policies and priorities.
45
46
47

48 49 **Patient and public involvement**

50 Patients and the public were not involved in the design of this study however this
51 data informed the development of the CEE model in the larger study. A working group
52 consisting of key members of the stroke multidisciplinary team provided feedback on this
53 study's findings and were involved in the development of the CEE model and embedding
54 approach, which was based on the outcomes of this study.
55
56
57

58 59 **Setting**

60

This study was conducted on an acute and a rehabilitation ward at a private hospital in Perth, Western Australia. The acute ward was a 26-bed unit with patients following acute stroke as well as other medical conditions. The acute ward had four individual rooms and nine shared rooms, two rooms with four beds per room, and seven rooms with two beds per room. Patients ate meals in their rooms and had access to an outdoor balcony area. The rehabilitation ward was a 44-bed mixed rehabilitation unit for patients following stroke and other medical, orthopaedic and post-surgical conditions. There were thirty-six individual rooms, and four shared rooms with two beds in each room. Patients had breakfast in their rooms but were encouraged to eat lunch and dinner in one of two communal dining areas.

Participants

Hospital staff participants: Purposeful sampling of acute and rehabilitation hospital staff was conducted to include at least one representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members who were over 18 years of age. The first author obtained formal consent from all participants in the study (see supplementary file for consent forms and procedures). A total of 51 staff and volunteers were recruited (Table 1.) by contacting staff department managers who identified staff currently working or had previously worked with patients following stroke on the acute or rehabilitation wards.

Patient participants: All patients consecutively admitted following stroke from January to February 2016, and June 2016 to July 2017 were screened for eligibility by the hospital site champions to participate in the study. Inclusion criteria: i) admitted to the acute or rehabilitation ward with an acute stroke, ii) less than 21 days post-stroke during data collection, iii) able to provide informed consent based on the judgement of the medical team responsible for the medical management of the patient, iv) Glasgow Coma Scale¹⁰ greater than 10, v) estimated total length of hospital stay greater than 14 days, vi) adequate English proficiency to participate in interviews as determined by managing speech pathologist or medical team. Exclusion criteria: i) uncorrected hearing or vision (for example hearing impairment without the use of hearing aids or vision impairment without the use of glasses), ii) medically unstable, iii) documented diagnosis of current untreated depression, documented diagnosis of dementia, previous aphasia or traumatic brain injury. The diagnosis of aphasia was confirmed for those who achieved a Western Aphasia Battery-Revised¹¹ Aphasia Quotient score less than 93.7. Eligible patients were approached by the site investigators for consent to be approached by the research team. The first author completed formal consent with all patient participants (see supplementary file for consent forms and procedures). A total of 9 patients were recruited, however 2 patients were withdrawn as they became medically unwell. Data collection was completed for 4 patients without aphasia and 3 patients with aphasia. See Figure 1. for the summary of patient screening and recruitment. Patient details and demographics are detailed in Table 2.

No staff or patients withdrew from participating in this study.

Data collection

The first author, a female speech pathologist (Bachelor of Speech Pathology, Honours) and PhD student with seven years clinical experience working in the hospital setting and five years research experience, including conducting interviews and focus groups, completed all semi-structured interviews and focus groups. Staff were informed that the researchers wanted to investigate their perceptions of the hospital ward environment in regards to communication opportunities to inform the development of a Communication Enhanced Environment (see supplementary file for staff and volunteer information and consent forms). Patients were informed that the researchers wanted to explore how the hospital environment influenced patient activity (see supplementary file for patient information and consent forms).

1
2
3 All interviews and focus groups were conducted using interview and focus group
4 guides (staff focus groups and interview guide Appendix B., patient interview guide
5 Appendix C.) and were audio recorded. Field notes were completed by the first author
6 during data collection. Seven staff focus groups were conducted with two to eight
7 participants in each focus group. One-on-one interviews were conducted with two staff
8 members. All staff focus groups were completed on the hospital site in various locations
9 that were private and quiet. Six out of seven patient interviews were conducted in person
10 during their inpatient admission in their hospital room, and one was completed over the
11 phone (patient without aphasia) one day following discharge from hospital. All patient
12 interviews were conducted within fifteen days post-stroke. Interview and focus groups were
13 20-60 minutes long, often varying based on the number of participants. Supported
14 conversation strategies¹² were used during interviews with patients with aphasia to
15 facilitate their participation in the interview. One patient with aphasia had two family
16 members present during the interview. During the interviews and focus groups, clarifying
17 questions and paraphrasing participant comments were used to confirm and clarify their
18 perspectives and insights.

Data analysis

Focus groups and interviews were transcribed verbatim. Responses to any leading questions were removed from the data set.¹⁵

The theoretical framework for this research was a qualitative description approach.¹⁶ This approach involves describing patient experiences, with minimal interpretation of the data to minimise potential bias of the researchers.¹⁶ Participant experiences were analysed using NVivo¹⁷ computer software to manage the data. Data were grouped into themes according to content.¹⁶ The first level of coding identified the broad content of the data then sub-categories were identified.¹⁶ Single lines of data were not removed from their 'story' during data analysis to maintain the context and help ensure meaning was not lost or misinterpreted.¹⁶ Ongoing critical review of the categories were conducted and themes were reviewed by a second researcher.¹⁶ Staff were provided feedback on the findings.

Results

The key themes from the focus group and interviews related to barriers and facilitators to communication, with sub-categories identified which related to hospital, staff and patient factors (Figure 2.).

Barriers to Communication

Hospital related factors

Private rooms reduce opportunities for social interaction

Staff and patients described the impact of single rooms which limited incidental socialisation with other patients and their visitors.

We used to co-locate our stroke patients [sic] and often using our shared rooms.

That's when people had more opportunities for interacting with one another.

(MedC1)

Mixed wards affect staff acquisition of specialist skills

Staff described their perception of the negative effect a mixed hospital ward had on the acquisition of stroke specific specialist skills.

Having a stroke specific ward... everybody on the ward would be trained...and that's the only thing they'd have to focus on rather than having lots of other patients with lots of medical conditions. (OT4)

Hospital environment does not encourage socialising

Staff talked about the physical hospital ward environment affecting social interaction as it contributed to a sterile atmosphere rather than one that promoted social activity. Staff also talked about the consequence of background noise and environmental distractors in large shared rooms on the acute ward which reduced their ability to communicate with patients with communication impairments.

My general feeling of rehab [rehabilitation] is that they come to their sessions and then they go back to their lonely dark room... I don't really see the rooms as a particularly happy, busy place where they are getting a lot out of being in there... the dining rooms... they're not a particularly pleasant place to be either. (PT2)

They [patients] can hear other people talking... there is [sic] a lot of voices going on which is going to impact on their understanding as well. (PT3)

Hospital policies restrict the development of communication-promoting ideas and initiatives

Hospital policies were perceived by staff as a barrier to communication, negatively influencing their ability to develop ideas and initiatives to increase patients' opportunities for social interaction. This included policies regarding leaving patients unattended in dining

1
2
3 areas without patient care assistants supervising them and requiring nurses to supervise
4 patients if they are eating; and reported limitations around food related activities as a result
5 of food hygiene policies and occupational health and safety.
6
7

8 It's just every time you try and do something you hit a barrier... you do try and think
9 outside the box what more can you do for this patient and you get another hospital
10 rule. (PT2)
11
12
13

14 **Power imbalance of staff and patients in hospital controls patients' ability to access** 15 **communication opportunities** 16

17 Staff and patients discussed the influence of the power imbalance for patients in
18 hospital, and patient perceptions that they have to do what is expected in the hospital
19 environment. This appeared to limit the patients' ability to freely engage and explore the
20 environment resulting in patients retreating to their rooms and limiting their opportunities
21 to engage in activities.
22
23
24
25

26 I think most males like to account for their time um and I felt like I haven't been able
27 to do that and that's, that's the bit that I'm really, really lacking. (PWA2)
28
29

30 I was in the hospital so I think I had to stick into the room, to the rules. (PWOA2)

31 Very often when you're in a hospital you do what you think you're expected to do.
32
33
34 (SP4)
35

36 **Task specific communication reduces patients' communication opportunities** 37

38 Staff talked about the nature of interactions with patients as often being driven by
39 the patient's care, restricting opportunities for communication beyond this context.
40

41 I know we aim to be very holistic... but very often care is very[sic] directed from a
42 medical health care perspective (SP4)
43
44

45 **Staff related factors** 46

47 **Staff's perception of time pressures limiting opportunities for communication** 48

49 Both patients and staff perceived staff time pressures as a barrier negatively
50 effecting communication on the wards. This may be the reflection of actual time pressures,
51 or staff perceptions of their available time. Some staff reported that they felt interactions
52 with patients with communication impairments required extra time which was challenging
53 in a time pressured hospital environment. Time pressures were also perceived to restrict the
54 staff's ability to facilitate opportunities for patients to socialise with other patients. For
55
56
57
58
59
60

1
2
3 example, nurses appeared to deprioritise transferring patients to the communal area for
4 lunch in busier times.
5

6
7 If they're hoist patients it might not be as easy for staff to get them to the dining
8 room, that wouldn't totally prevent someone from going, it would just depend on
9 the time that people had on the day. (SW3)
10
11

12 **Staff and patient's underutilisation of available resources**

13
14 Staff described the lack of accessible resources as a factor negatively affecting staff-
15 patient communication. They described the need for resources when communicating with
16 patients with aphasia and other communication impairments but felt unsure about what
17 these were or how to access them. They also described a number of resources that they felt
18 patients were not aware of and therefore did not utilise such as volunteer services that
19 promote communication opportunities and facilitate patient access to outdoor areas.
20
21
22
23
24

25
26 I feel like I don't know where else to go. I don't know if other things that [sic] could
27 help us, maybe there's things out there that I don't know about that would help us
28 communicate with these patients. (PT2)
29
30

31
32 There are all of these opportunities but I don't think a lot of the patients access them
33 so it sounds like great communicative opportunities for them but the reality is that a
34 lot of them are sitting in their rooms most of the times by themselves watching
35 television and most of the interactions they have is with the nurses or just whoever
36 comes in to see them. (SP4)
37
38
39
40

41 **Individual staff factors leading to restricted opportunities for communication**

42
43 Staff described individual staff factors such as personality, values and attitudes
44 influencing communication opportunities for patients, such as staff providing patients with
45 opportunities for incidental social interaction during routine tasks.
46
47

48 Often if people need to go in and see the patient let's just say to take obs
49 [observations] or to do a wash... they don't always use that opportunity as an
50 opportunity to chat... there could be more opportunity to chat at those times whilst
51 they are doing what they need to get done and you know that varies from person to
52 person, personality as well and how busy people are, what else is going on. (SP3)
53
54
55
56

57 **Staff's perception their role does not include communication tasks**

1
2
3 Some staff perceived communication as a task separate from the responsibility of
4 their role therefore limiting their facilitation of communication opportunities for patients.

5
6 They [speech pathologists] do their bit and we do ours... we don't have time to
7 practice speech with them because we really do have to get all of our jobs filled in
8 the time and it's specifically rostered for us to do our work, not to help with
9 someone else's. (RehabN1)

14 **Lack of staff knowledge and skills resulting in unsuccessful communication interactions or** 15 **avoiding communication interactions**

16
17 Staff described a lack of knowledge and skills in communicating with patients with
18 communication impairments. Some staff reported feeling anxious about encouraging
19 patients to communicate as communication breakdowns may cause stress and anxiety for
20 the patient, and the staff member. Staff reported a lack of confidence in their ability to
21 repair communication breakdowns which resulted in increased time pressures in their
22 sessions, often leading them to avoid encouraging communication interactions within their
23 treatment sessions.

24
25 I find it challenging... knowing how the best way to communicate with that person
26 [with aphasia]... then [they] become very frustrated and not have the tools
27 themselves to communicate back to me and you would never want to leave
28 someone in that space. So that's something that I struggle with. (SW2)

30 **Patient related factors**

31
32 Patient related factors reflected their functional and medical status, personality,
33 mood and motivation, which were perceived by staff and patients to often act as a barrier to
34 engaging in communication interactions during their hospital admission early after stroke.

35 **Patients' functional and medical status limiting their ability to seek out and engage in** 36 **activities**

37
38 Staff and patients perceived patients' medical status as a barrier to communication
39 by limiting their ability to engage with their environment including independently seeking
40 out activities and being able to utilise communal areas.

41
42 If someone is bed bound, you know the interaction is very minimal... you often walk
43 past and you see them alone in their room... you wonder what happens during those
44 periods of time where they're just in their room and they don't have family. (OT2)
45 Well, I can't do anything cos I can't go off by myself and do anything. (PWOA2)

Individual patient factors limiting opportunities for communication

Staff described individual patient factors such as personality, mood and motivation communication opportunities for patients such as independent practice of communication therapy tasks, and social opportunities with patients and hospital staff.

We have to recognise some patients who have had strokes... they're fed up with having people poking and prodding them then have a volunteer and go "do you want to do your exercises for speech?" (VM)

They need a break after OT [the occupational therapist] has done a shower. If they don't get that break then the physio isn't going to be as good for them because they're so tired, so we also have to look at break times in between each sessions... (OTA1)

Facilitators to Communication

Hospital related factors

Shared rooms/co-location encourages incidental social interactions

Staff talked about use of communal areas at other hospitals which facilitated socialisation and communication during non-therapy times and during group therapy. Staff described the importance of the use of communal areas given the large number of private rooms on the ward. Patients also described the need to be co-located to promote social interaction.

I think that, put the [sic] whole lot of people together and ah and they [sic] something collective, that's what human beings are put together for ... sitting around talking... over the proverbial cuppa. (PWA2)

Visitors provide patients opportunities for socialisation

Staff identified visitors as a facilitator to communication interaction for patients outside of therapy times during their inpatient admission.

Interaction with the family... it's not therapy based but it's their [patients'] opportunity to practice. (PT1)

Volunteers facilitate opportunities for patients to engage in social activities

Staff discussed the benefit of volunteers in facilitating opportunities for patients to engage in social interactions including programs involving therapy dogs, book loaning, hand massages, and taking patients off the ward.

1
2
3 If we see people that are lonely, are not getting visitors, there's many volunteers... to
4 go and visit them and if they're well enough they can take them out... the volunteers,
5 we do rely on them. (OTA1)
6
7
8
9

10 **Staff related factors**

11 **Staff utilisation of resources promote communication exchange**

12 Staff identified access to resources such as chat books and alternative and
13 augmentative communication boards often facilitated communication interactions with
14 patients with communication impairments on the ward.
15
16
17

18 Sometimes with the ... signs... "do you want to drink? some water?" or something, so
19 they can just point because ... they want to say something and maybe the right
20 words are not coming out... that also helps. (RehabN3)
21
22
23
24

25 **Speech pathology support and education facilitates staff's use of communication** 26 **promoting strategies**

27 Staff reported support and education from speech pathology staff facilitated their
28 ability to interact successfully with patients with aphasia.
29
30

31 I had a patient who had word finding difficulties... I just was observing the speechie
32 [speech pathologist], she would just be like "no, what do you mean?" and he'll be
33 like [pointing] and she'll be like "tell me what's the word"... it's something I could
34 have just added to my session. (PT4)
35
36
37
38
39

40 **Staff knowledge and utilisation of communication strategies promotes communication** 41 **activities**

42 Staff and volunteers discussed the use of communication strategies and resources to
43 facilitate communication on the ward for patients with a variety of communication
44 impairments.
45
46
47

48 We use communication boards, pictures, writing things down, talking slowly.
49

50 (MedC2)

51 If they are having trouble, I will say to them "it's okay you don't need to hurry, that's
52 fine". (V1)
53
54
55

56 **Individual staff factors promote communication opportunities for patients**

1
2
3 Staff and patients talked about how individual characteristics of staff, including
4 rapport building and being friendly, facilitated communication for patients with
5 communication difficulties.
6
7

8 Sometimes they [patients] look for that specific person... the more they get
9 confident, the more they get relaxed, the more their speech enhances as well.
10
11

12 (RehabN3)
13
14
15

16 Discussion

17 This study aimed to explore hospital staff, volunteers and patients' perceptions of
18 barriers and facilitators to communication on an acute and a rehabilitation ward. A wide
19 range of factors were perceived to act as potential barriers or facilitators to communication.
20 Additionally, a number of factors influencing patient access to communication opportunities
21 appeared to influence one another.
22
23

24 The co-location of patients in therapy spaces, dining areas or in shared rooms were
25 perceived as facilitators to communication for patients, providing opportunities for
26 incidental social interactions with other patients and their visitors. However, background
27 noise in these shared spaces was also perceived to act as a barrier to their ability to engage
28 in communication. Patient access to communal spaces was influenced by a number of
29 factors including patients' sense of autonomy to freely explore the hospital ward
30 environment, and their medical and mobility status, and staff's perception of their available
31 time, which influenced staff's perception of whether they transferred patients to these
32 spaces. Rosbergen et al¹⁸ reported that in an acute stroke ward enriched environment
33 communal mealtimes and group activities were perceived to facilitate social activity. The
34 study by Rosbergen et al¹⁸ found that staff reported perceptions that shared rooms limited
35 staff and patients' ability to engage in private conversations, consistent with O'Halloran et
36 al's¹⁹ findings. It may be that access to both private and communal spaces available within
37 the hospital environment play critical roles in regards to providing opportunities for social
38 interactions with other patients and their visitors and opportunities for privacy when
39 required.
40
41
42
43
44
45
46
47
48
49
50
51
52
53
54
55

56 The acute and rehabilitation wards had a large proportion of single rooms, which
57 could have been considered the result of this study being conducted at a private hospital.
58 However, there has been a perceived trend towards increased proportions of single rooms
59
60

1
2
3 in newly built public hospitals to promote infection control and patient privacy which may
4 have a detrimental effect on communication.^{20,21} The predominance of single rooms and
5 limited opportunities to access shared spaces may have increased the effect of other
6 barriers on communication opportunities for patients. For example, a patient with poor
7 autonomy may be more likely to remain alone in their single room when they are not
8 attending therapy, as they perceive they are not 'allowed' to freely explore the hospital
9 environment. This may reduce the likelihood of the individual independently seeking out
10 social interactions beyond their room. If they also have reduced mobility, they may be more
11 reliant on staff to facilitate transfers to communal spaces which may be impacted by staff
12 time constraints. The patient's functional status and levels of fatigue may also limit their
13 ability to initiate and engage in activities while they are in their room. Therefore, the
14 combined effect of these barriers may significantly limit this patient's communication
15 opportunities.

16
17
18
19
20
21
22
23
24
25
26
27 These communication barriers may be mitigated by having scheduled rest periods,
28 and periods allocated to encouraging visitors to provide opportunities for communication
29 and socialisation within their room, and facilitate patient access to shared spaces, such as
30 helping mobilise wheelchair users into communal dining areas or education to patients that
31 they are allowed to explore the hospital ward environment. Rosbergen et al¹⁸ identified
32 patient and family autonomy to initiate and direct activity as a factor enriching the acute
33 ward environment. Therefore, increasing patient autonomy within this setting may facilitate
34 their ability to seek out interactions within the environment and increase engagement in
35 communication activity, which may then reduce the effect of being in a single room with
36 reduced mobility and time poor staff.

37
38
39
40
41
42
43
44
45 A potential lack of opportunities to access social interactions with other patients
46 means staff, including volunteers, and visitors may become the main communication
47 partner for patients. Godecke et al's⁶ observation study found that nurses are the most
48 frequent communication partner for patients following stroke with aphasia, after their
49 family members, therefore patient-staff interactions may play a significant role for those
50 patients with minimal or no visitors. It is interesting to note that this study recruited a
51 limited number of acute nurses in comparison to rehabilitation nurses. This could be
52 interpreted as a reflection of differences in nurses' capacity for additional activities within
53 the demands and time restrictions of the acute ward context in comparison to the
54
55
56
57
58
59
60

1
2
3 rehabilitation ward context. Within the current study, communication between staff and
4 patients appeared to be dependent on a number of factors including staff perception of
5 their role, their knowledge and skills in facilitating communication, their values and
6 attitudes towards communication and whether supporting language and communication for
7 patients with aphasia is part of their 'role', their willingness to be flexible with their time,
8 and their knowledge of and access to resources which may be used to facilitate
9 communication. This also highlights the potential impact of the perceived power imbalance
10 between staff and patients and the significance of interactions that are task directed. Hersh
11 et al²¹ reported patients with aphasia felt disempowered in communicative interactions
12 with nurses. Nurses often talked to the task and controlled interactions with
13 patients.^{22,23} This highlights the need for communication partner training which may provide
14 staff with the knowledge and skills required to support effective communication with
15 patients with aphasia.²⁴ Implementation strategies will need to be considered to promote
16 behaviour change as well as the uptake and maintenance of training including involvement
17 of management and ward champions, and ensuring trained communication strategies are
18 easy to learn, apply and audit in order to be applicable in this busy context.²⁵

Time pressure was perceived as a major barrier to communication impacting on staff's ability to support successful communication within their interactions with patients and facilitate patients' opportunities to engage in interactions in social or communal areas. Time constraints have been reported to limit communicative opportunities between patients following stroke and nurses.²⁶ Ball et al²⁶ found that 86% of surveyed nurses reported one or more activities had been "left undone" in their last shift as a result of lack of time. The study found that activities most likely to be missed by nurses as a result of time constraints were comforting and talking to patients (66%) and patient education (52%).²⁶ This has also been identified by patients who "did not like to bother the busy nurse".²⁷ Time limitations and pressures on the wards may be facilitated by developing staff knowledge of and skills in using communication promoting strategies. Effective and efficient nurse patient communication as a result of nurse training has been found to save time, reduce frustration and reduce the burden associated with caring for patients following stroke with aphasia.²⁸ Additionally, time limitations reported by staff may lend to an argument for additional nursing allocation for patients with communication impairments.

1
2
3 This study included a small number of medical and nursing staff in comparison to
4 compared to allied health staff which may be reflected in the reported results. This study
5 also involved a small number of patients and a broader range of perspectives may have
6 been expressed with a larger number of participants. This study was conducted at a private
7 hospital involving a mixed acute and a mixed rehabilitation ward, and a relatively
8 homogenous groups of participants linguistically and ethnically, therefore these results
9 reflect this context and may not be directly generalisable to hospitals in the public sector,
10 nor did they explore cultural factors contributing to communication.

18 **Conclusions**

19 The barriers and facilitators to communication appear to be interconnected and
20 likely to influence one another, suggesting that the level of communication access may vary
21 from patient to patient within the same setting. Results of this study highlight a number of
22 practical changes that could be implemented to promote communication opportunities for
23 patients admitted to hospital early after stroke. However, implementation of behaviour and
24 cultural change strategies may be pertinent to promote meaningful and sustainable change
25 within the hospital setting. Consideration of areas for co-location for patients such as
26 therapy spaces, dining areas or shared rooms as well as access to private spaces may
27 potentially address the need for social opportunities with other patients as well as access to
28 privacy when required. The promotion of visitors attending the wards may facilitate
29 communication opportunities for patients between therapy times by providing socialisation
30 in patients' rooms as well as facilitating and advocating for patient access to communal
31 areas. This has the potential to mitigate the effect of social isolation in single rooms, staff
32 time restraints and limitations as a result of patients' medical status. Strategies to promote
33 patient autonomy in hospital may promote their ability to freely explore the environment
34 beyond their room may help address the power imbalance that can occur between patients
35 and hospital staff. Additionally, health staff and volunteer education in using
36 communication promoting strategies may increase opportunities for interactions between
37 patients, and staff or volunteers and promote communication exchange within those
38 interactions. These factors will be explored in a Communication Enhanced Environment,
39 which aims to increase patients' opportunities to engage in language activities during early
40 stroke recovery in hospital.

Consolidated criteria for reporting qualitative studies (COREQ)⁹: 32-item checklist

No Item	Guide questions/description	Location within paper
Domain 1: Research team and reflexivity		
Personal Characteristics		
1. Interviewer/facilitator	Which author/s conducted the interview or focus group?	Page 10
2. Credentials	What were the researcher's credentials? E.g. PhD, MD	Page 10
3. Occupation	What was their occupation at the time of the study?	Page 10
4. Gender	Was the researcher male or female?	Page 10
5. Experience and training	What experience or training did the researcher have?	Page 10
Relationship with participants		
6. Relationship established	Was a relationship established prior to study commencement?	Page 7
7. Participant knowledge of the interviewer	What did the participants know about the researcher? e.g. personal goals, reasons for doing the research	Supplementary files, participant information and consent forms, page 10
8. Interviewer characteristics	What characteristics were reported about the interviewer/facilitator? e.g. Bias, assumptions, reasons and interests in the research topic	Page 10
Domain 2: study design		
Theoretical framework		

9. Methodological orientation and Theory	What methodological orientation was stated to underpin the study? e.g. grounded theory, discourse analysis, ethnography, phenomenology, content analysis	Page 13
Participant selection		
10. Sampling	How were participants selected? e.g. purposive, convenience, consecutive, snowball	Page 8, 10
11. Method of approach	How were participants approached? e.g. face-to-face, telephone, mail, email	Page 8, 10
12. Sample size	How many participants were in the study?	Page 8, 10
13. Non-participation	How many people refused to participate or dropped out? Reasons?	Figure 1, page 8
14. Setting	Setting of data collection Where was the data collected? e.g. home, clinic, workplace	Page 7-8
15. Presence of non-participants	Was anyone else present besides the participants and researchers?	Page 11
16. Description of sample	What are the important characteristics of the sample? e.g. demographic data, date	Table 2, page 12
Data collection		
17. Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	Appendix B, Appendix C
18. Repeat interviews	Were repeat interviews carried out? If yes, how many?	NA
19. Audio/visual recording	Did the research use audio or visual recording to collect the data?	Page 10
20. Field notes	Were field notes made during and/or after the interview or focus group?	Page 10
21. Duration	What was the duration of the interviews or focus group?	Page 11

22. Data saturation	Was data saturation discussed?	Page 5
23. Transcripts returned	Were transcripts returned to participants for comment and/or correction?	No
Domain 3: analysis and findings		
Data analysis		
24. Number of data coders	How many data coders coded the data?	Page 13
25. Description of the coding tree	Did authors provide a description of the coding tree?	Figure 2
26. Derivation of themes	Were themes identified in advance or derived from the data?	Page 13
27. Software	What software, if applicable, was used to manage the data?	Page 13
28. Participant checking	Did participants provide feedback on the findings?	Page 13
Reporting		
29. Quotations presented	Were participant quotations presented to illustrate the themes / findings? Was each quotation identified? e.g. participant number	Page 14-20
30. Data and findings consistent	Was there consistency between the data presented and the findings?	Page 14-20
31. Clarity of major themes	Were major themes clearly presented in the findings?	Figure 2
32. Clarity of minor themes	Is there a description of diverse cases or discussion of minor themes?	Page 14-20

Appendix B.

Investigating Communication Enhanced Environments after stroke: Staff focus group guide

What kind of language activities or language tasks do patients following stroke currently participate in on the ward?

What kind of language activities or language tasks would you like see patients following stroke have access to on the wards?

Describe your experience of communicating with patients following stroke at the moment.

Can you tell me about anything that facilitates your ability to communicate with patients following stroke on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with patients following stroke on the ward?

What changes would you like to see to enhance communication between staff and patients following stroke on the ward?

What changes would you like to see to enhance communication between visitors and patients following stroke on the ward?

How could we enhance or optimise communication and language tasks and activities for patients following stroke on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

Appendix C.**Investigating Communication Enhanced Environments after stroke: Patient interview guide**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

1 Abbreviations and Definitions of Terms

CEE model: Communication Enhanced Environment model, an adapted model of an Enriched Environment, an environment that provides patients following stroke opportunities to engage in language activities during inpatient rehabilitation.

PWA: Patients following stroke with aphasia.

PWOA: Patients following stroke without aphasia.

Language activities: Language tasks that consist of solitary or interactive language activities.

Solitary language activities: Activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications.

Interactive language activities: activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

EE: Enriched Environment, an environment that promotes physical, cognitive and social activity.

2. Protocol Synopsis

Study Title:	Investigating a Communication Enhanced Environment model on acute and rehabilitation wards early after stroke: A before-after non-randomised controlled pilot study
Study type:	Interventional
Study Intervention:	<p>A Communication Enhanced Environment (CEE) model will be developed from pre-intervention observations of inpatient language activities and investigations of barriers and facilitators to communication together through focus groups with hospital staff and interviews with patients on the acute and rehabilitation wards.</p> <p>Sixteen patients following stroke will be recruited in this prospective before-after non-randomised controlled pilot study set in an acute and a rehabilitation ward of a metropolitan private hospital. The study includes: i) The baseline phase which involves observation of patients following stroke (n=8, 4 patients with aphasia (PWA) and 4 patients without aphasia (PWOA)); the collection of qualitative data through focus groups and semi-structured interviews to determine patient and staff perceived barriers and facilitators to communication; ii) the implementation phase where a CEE model will be developed and embedded in usual care; iii) the post-implementation phase which will involve repeated baseline data collection on a different cohort of patients (n=8, 4 PWA and 4 PWOA) to determine i) how solitary and interactive language activity levels changed following implementation of the CEE model, ii) the differences post CEE implementation in hospital staff's use of communication promoting strategies when interacting with patients, iii) the differences post CEE implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>The CEE model will include the provision of:</p> <ul style="list-style-type: none"> i) CEE model equipment, for example reading materials such as books and magazines, and access and encouragement to reside in a communal dining area; ii) CEE model education, support and training for staff with the aim to develop the ability to facilitate language activities for patients after stroke. The training program will be guided by research evidence, expert opinion and baseline data. Staff will complete a questionnaire pre and post training to determine changes in their knowledge, skills and attitudes regarding communication and aphasia. <p>Control treatment: Patients following stroke with and without aphasia will be observed and video recorded over two weekdays and one weekend day pre (n=8) and post (n=8) implementation of a CEE model. Behavioural mapping will record patient interactive and solitary language activity observed within the first minute of 5-minute intervals in 4-hour time periods between 7am and 7pm. <i>Solitary language activities</i> are activities that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications. <i>Interactive language activities</i> are activities which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.</p>

<p>Objectives of the Study:</p>	<p>This study aims to investigate a CEE model on an acute and rehabilitation ward and if stakeholders perceive a CEE model as valuable by addressing the following research questions:</p> <ul style="list-style-type: none"> - Does a CEE model increase the amount of time PWA and PWOA spend in participating in solitary and interactive language activities on acute and rehabilitation wards during the early post-stroke period? - What are the differences in patients' experience of communication in a CEE model compared to patients' experience of communication in a standard environment on in-patient acute and rehabilitation wards? - What is the experience of implementing a CEE model for staff working with PWA and PWOA within in-patient acute and rehabilitation wards? - Do staffs' perceptions of their knowledge of, skills with, and attitude towards communication and aphasia change following implementation of a CEE model?
<p>Number of Centres:</p>	<p>1</p>
<p>Study duration:</p>	<p>5 years</p>
<p>Study Hypothesis:</p>	<p>A CEE model will increase patient engagement in solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.</p>
<p>Primary outcomes:</p>	<p>The primary outcome is the change in the proportion of solitary and interactive language activities as a percentage of total observed activity after the implementation of the CEE model.</p> <p>Timepoint: Patient observations completed within 21 days post stroke.</p>
<p>Secondary outcomes:</p>	<p>The differences post CEE model implementation in staff and patient perceptions of the barriers and facilitators to inpatient language activities.</p> <p>Timepoint: Within 18 months of embedding the CEE model.</p>
<p>Study design:</p>	<p>Before-after non-randomised pilot study</p>
<p>Key inclusion criteria:</p>	<p>Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a stroke, less than 21 days post stroke during baseline phase or post-implementation phase, the ability to provide informed consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening, an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below 93.7 on the Western Aphasia Battery-Revised.²</p> <p>Staff participants: One representative from each acute and rehabilitation staff group including medical, nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.</p>
<p>Key exclusion criteria:</p>	<p>Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at the time of acute admission or are a participant in another research trial which may affect this study's outcome measures.</p>
<p>Study Procedures:</p>	<p>Baseline phase: Eligible patients during the baseline phase will be observed and video recorded for 4 hours on 3 consecutive days (one weekend and two weekdays) and will complete a semi-structured interview to explore their experiences of communication, and their perceptions of barriers and facilitators to inpatient language activities during their inpatient admission.</p>

	<p>Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to inpatient language activities. A focus group interview schedule will be used across all focus groups.</p> <p>Implementation phase: The CEE model will be implemented within the acute and rehabilitation wards.</p> <p>Post-implementation phase: Intervention group patient observations and interviews, and staff focus groups will replicate baseline data collection.</p>
Safety parameters	<p>Patients and/or their significant others may experience increased levels of distress during recruitment and/or data collection. This may be the result of adjustment following stroke and/or diagnosis of aphasia and increased awareness of impairment. No other risks known regarding participation in this project. The baseline assessments and interview will be conducted by the Chief Investigator who has experience in supporting patients during this early stage of stroke recovery. If a patient or any significant others becomes upset or distressed, the assessment or interview will be paused with the option to discontinue and counselling strategies will be provided.</p>
Statistical methods /analysis	<p>Patient demographic and stroke characteristics will be presented using descriptive statistics. One-way ANOVA or the Kruskal-Wallis and chi-square tests will examine differences in characteristics between groups. Time spent observed in interactive and solitary language activities will be expressed as a percentage of total observations. A mixed design ANOVA will be used to calculate the within-subjects variable of presence of aphasia and the between-subjects variable of a CEE on language activity levels of patients by comparing baseline to intervention phase observations. A qualitative description research approach will be used for the qualitative component of this research. The mixed methods design will enable the triangulation of the qualitative and quantitative data.</p>
Sample size determination:	<p>The patient sample size was selected for this pilot study to collect data across each observation period for each patient group in the baseline and intervention phases (see document: Observation_protocol_SD_version 3_23-02-16). The sample size for staff participants was selected to capture a sufficient breadth of professional perspectives.</p>

3. Introduction

Aphasia is an acquired communication disorder that affects approximately 30% of first ever ischaemic stroke survivors³ and persists in up to 61% of survivors one-year post stroke.⁴ Aphasia impacts all communication modalities with significant negative consequences for social participation, interpersonal relationships, autonomy, capacity to work and quality of life.⁵

Patients following stroke with aphasia (PWA) have been observed to spend less than 28% of their day communicating and 44% of their day alone during their first weeks of inpatient rehabilitation.⁶ Inadequate opportunities for communication places PWA at risk of developing maladaptive behaviours such as learned non-use of language.⁷

Environmental Enrichment (EE) refers to conditions which promote physical, cognitive and social activity and has been shown in animal models of stroke to enhance neuroplasticity⁸, promote better learning and memory and contribute to significant improvements in motor function.⁹ The human equivalent model¹⁰ in a rehabilitation unit results in patients spending more time engaged in activity and less time sleeping and alone.¹¹

4. Objectives

Aphasia is a complex language impairment and PWA may need additional support within an Enriched Environment. This pilot study seeks to develop and test an adapted model of an Enriched Environment, a Communication Enhanced Environment (CEE), as a strategy to provide PWA and patients following stroke without aphasia (PWOA) more opportunities to engage in language activities during inpatient rehabilitation. Within this study language activities include both *solitary activities* that may promote aphasia recovery such as reading, writing, listening to the radio, and the use of iPad applications, and *interactive activities* which are based in communicative interactions that involve an exchange of information with a communication partner involving talking, gesture and/or facial expression, reading, writing or drawing to communicate.

4.1 Hypotheses

A CEE will increase patient solitary and interactive language activities and improve staff and patient experiences of communication compared to a standard ward environment.

5. Study design

This mixed methods pilot study is a prospective before-after non-randomised controlled design in an acute and a rehabilitation ward of a metropolitan private hospital. The study involves three phases:

- i) *Baseline*: observe and quantify the current ward environment;
- ii) *Implementation* of the CEE model;
- iii) *Post-implementation*: assess the impact of the CEE model.

6. Study Population

- i) *Patients*: The baseline group (n=8, 4 PWA, 4 PWOA) recruited within the baseline phase, and the intervention group (n=8, 4 PWA, 4 PWOA) recruited during the post-implementation phase.

- 1 ii) *Staff participants*: One representative from each acute and rehabilitation staff group including medical,
2 nursing, volunteers, and allied health staff members (n=17), who are over 18 years old.

3 **6.1 inclusion and exclusion criteria**

4 Patients will be eligible for inclusion if they have/are: admitted to the acute or rehabilitation ward for a
5 stroke, less than 21 days post stroke during baseline phase or intervention phase, the ability to provide informed
6 consent as determined by the medical team, a Glasgow Coma Scale¹ score greater than 10 at the time of screening,
7 an estimated length of hospital stay greater than 14 days, adequate English proficiency to participate in semi-
8 structured interviews and are above 18 years of age. Patients with aphasia will also have an Aphasia Quotient below
9 93.7 on the Western Aphasia Battery-Revised.²

10 Patients will be excluded if they have/are: uncorrected hearing or vision, not medically stable, a documented
11 diagnosis of dementia, traumatic brain injury or previous aphasia, a documented current untreated depression at
12 the time of acute admission or are a participant in another research trial which may affect any of this study's
13 outcome measures.

14 Staff and volunteers who are over 18 years old will be eligible to participate in this study.

15 **7. Study Assessments and Procedures**

16 **Baseline**

17 All recruited patients will complete the Montreal Cognitive Assessment,¹¹ and The NIH Stroke Scale.¹² PWA
18 will also complete the Western Aphasia Battery-Revised.² Patients' behaviour will be observed and video recorded
19 for four hours per day on a Sunday, Monday and Tuesday between 7am to 7pm. A behaviour mapping tool
20 (Appendix A) developed for this study will record patient engagement in language activities in the first minute of
21 each five-minute interval across each four-hour observation period. Semi-structured interviews will explore patients'
22 perceptions of barriers and facilitators to inpatient language activities. An interview schedule will be used across all
23 interviews (Appendix B.). Supportive communication strategies will be used to facilitate PWA participation in
24 interviews with transcriptions annotated to capture any non-verbal responses.

25 Staff will participate in a one-hour focus group to explore their perceptions of barriers and facilitators to
26 inpatient language activities. A focus group/interview schedule (Appendix C.) will be used across all focus groups.

27 **Implementation**

28 The CEE model will be implemented within the acute and rehabilitation wards.

29 **Post implementation**

30 Intervention group patient observations and interviews, and staff focus groups will replicate baseline data
31 collection.

32 **8. Study Treatment**

33 The CEE model incorporates the following strategies to encourage engagement in language activities:

- 34 i) Staff training to facilitate patients' communication and provide opportunities to engage in language
35 activities;
- 36 ii) Patient access to:

- a) Communication enhancement resources such as iPads and audiobooks;
- b) Communal areas to facilitate engagement amongst patients.

9. Participant Completion and Discontinuation

9.1 Participant Completion

Participants will have completed the study when they have completed the semi-structured interview.

9.2 Participant withdrawal

Participation in this study is voluntary. The participant can withdraw from taking part in the study at any time without giving a reason for withdrawing.

10. Data analysis

10.1 Primary Analysis

The proportion of observed episodes where PWA and PWOA are engaged in language activities at baseline and post implementation will be analysed using a mixed design ANOVA.

10.2 Secondary Analysis

The differences in staff and patient perceptions of the barriers and facilitators to inpatient language activities and communication post CEE implementation will be analysed through a qualitative description approach. Triangulation of the qualitative and quantitative data will be conducted.

11. Data management

The data collected will be confidential. No identifying information will be attached to the data and any information that may reveal participant's identity will be removed. The master list of participant names and codes will be kept in a locked filing cabinet at the hospital site which will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The de-identified data will be stored on a password-controlled computer and/or in a locked cabinet at Edith Cowan University. Electronic data will be backed up on a password controlled hard drive only accessible by the Chief Investigator.

The data collected from this study will have a significant contribution to the aphasia research area and therefore will be stored for 15 years following the completion of this study. Data may be accessed for future studies by the study investigators or higher degrees by research (HDR). In the case of HDR use of the data, the use of the data will be bound by a two-way confidentiality agreement. The data may be used for teaching purposes only with the additional written permission from participants. The data may be made accessible to consumer groups (for example the Australian Aphasia Association) and information may be made available through the National Stroke Foundation and scientific journals. Confidentiality will be maintained in all circumstances. Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data are only used for approved purposes. Researchers who access this data from the data bank will not have access to the participant keys that attach participants to codes therefore data will only be re-identifiable by the Chief Investigator. Data will be deleted from electronic storage and hard copy data will be shredded by the chief

investigator after 15 years completion of the research study (with Ethics Committee approval, Ethics approval numbers: HPH431 and ECU HREC 12149). Non-identifiable data will be added to data archives for data sharing. Researchers who access data archives will not have access to information attaching participants to coded data.

12. Study Report

This study will be published in a PhD thesis as part of the Chief Investigator's Higher Research Degree. Outcomes from this study will be published in peer review journals and at conferences.

13. Administration Procedures

13.1 Ethical Considerations

This research is likely to have a significant impact on aphasia recovery following stroke and will form the basis for future study designs. This study will develop a teaching and learning package that can be used in the future to facilitate and promote increased levels of communication activity during early stroke recovery. The implementation of a CEE may address missed opportunities for language stimulation, harness increased levels of neuroplasticity and optimise aphasia language recovery after stroke. The benefit of a CEE may extend beyond patients with aphasia and may improve health care experience and communication access for all patients following stroke. Additionally, these benefits may extend beyond patients involved in the study as trained staff may use skills and knowledge obtained in the training program to enhance the communication environment of all patients they care for.

13.2 Ethical Review Committee

All processes and documentation used within this study will be reviewed and approved by the Edith Cowan University Research Ethics Committee and the site Ethics Committee. The Chief Investigator will complete the annual ethics reports and will be responsible for reporting any adverse events to the Ethics Committees.

13.3 Informed Consent

Participants will be excluded if they do not have adequate English proficiency to participate in semi-structured interviews and focus groups. Any participants that require an interpreter will be excluded from inclusion in this study as determined by the medical team.

Patients with aphasia will be provided with aphasia friendly information sheets and consent forms with simple language, bold key words and pictorial support. This will be read and explained by the researcher. Supported conversation strategies will be used to support and facilitate patients with aphasia's involvement and understanding of the research process, informed consent and their rights to withdraw at any time. This will be provided by the Chief Investigator who is a qualified speech pathologist with experience in communicating with patients with aphasia using supported conversation techniques to facilitate and support communication. A detailed information will also be provided to the 'person responsible' for all patients.

13.4 Protocol Amendments

All protocol amendments will be reviewed and accepted by the Edith Cowan University Research Ethics Committee and the site research Ethics Committee.

Appendix B. Patient interview guide

Investigating Communication Enhanced Environments after stroke**Patient Interview guide, version 1_11-8-15**

Tell me about what kind of activities you do while you are here (in hospital).

Describe your experience of communicating with people on the ward.

What makes it easier to communicate with people on the ward?

What makes it hard to communicate with people on the ward?

What can we do to make communicating with people easier?

For peer review only

Appendix C. Staff focus group guide.

Investigating Communication Enhanced Environments after stroke
Staff focus group guide, version 1_27-7-15

STAFF FOCUS GROUP GUIDE BASELINE PHASE

What kind of language activities or language tasks do patients following stroke currently participate in on the ward?

What kind of language activities or language tasks would you like see patients following stroke have access to on the wards?

Describe your experience of communicating with patients following stroke at the moment.

Can you tell me about anything that facilitates your ability to communicate with patients following stroke on the ward?

Can you tell me about any barriers you experience that impact your ability to communicate with patients following stroke on the ward?

What changes would you like to see to enhance communication between staff and patients following stroke on the ward?

What changes would you like to see to enhance communication between visitors and patients following stroke on the ward?

How could we enhance or optimise communication and language tasks and activities for patients following stroke on the ward?

What do you think a communication and language enhanced stroke ward environment might look like?

STAFF FOCUS GROUP GUIDE POST-IMPLEMENTATION PHASE

Describe your experience of communicating with patients following stroke at the moment.

Can you tell me about any barriers you experience that impact your ability to communicate with patients following stroke on the ward?

Describe the differences in the communication environment since implementing the model.

What changes did you see to enhance communication between staff and patients following stroke on the ward?

What changes did you see to enhance communication between visitors and patients following stroke on the ward?

What was it like to use the model?

How do you feel about the model?

Can you tell me about anything that helped you use the model with patients following stroke on the ward?

Can you tell me about any barriers you experienced while implementing the model?

How can we improve the model?

Communication Enhanced Environments after Stroke

Study procedure version 2_23-02-16

BASELINE:

Staff recruitment: The Chief Investigator will recruit staff participants through a verbal explanation of the study and the provision of the information sheets and written consent forms. Staff will be provided 48 hours to discuss the study and ask questions before consenting to participate. Staff interviews and focus groups will commence as staff participants are recruited. Staff will participate in a one-hour focus group or a one-hour semi-structured interview (in person or via telephone) to explore staff perceptions of environmental barriers and facilitators to language activity and communication on in-patient acute and rehabilitation wards.

Patient recruitment: All consecutively admitted patients following stroke during the baseline period will be screened for eligibility to participate in the study. The hospital site investigators will identify potential patient participants that meet the inclusion and exclusion criteria. Patients following stroke with aphasia will be identified by the hospital speech pathology or medical team as having a diagnosis of aphasia (aphasia diagnosis will be confirmed via Western Aphasia Battery-Revised (WAB-R)¹ Aphasia Quotient score <93.7 during data collection). The site investigators will approach potential participants and gain verbal consent from the patient to be approached by a member of the research team and have their 3-point identification released to the research team. This will be documented in the patient's integrated medical progress notes. Once verbal consent has been gained and documented, the site investigators will email the Chief Investigator the patient alert proforma identifying the patient as meeting the inclusion/exclusion criteria. The research team will liaise with the medical team to confirm the potential participant meets the inclusion criteria: (i) admitted to the in-patient unit for recent stroke, (ii) are less than 21 days post stroke and during baseline phase or intervention phase, (iii) have the ability to provide informed consent as determined by the medical team iv) Glasgow Coma Scale² greater than 10 at the time of screening, (v) have an estimated length of stay greater than 14 days and (vi) have adequate English proficiency to participate in semi-structured interviews. Patients will be excluded if they (i) have uncorrected hearing or vision (for example hearing impairment without hearing aids, vision impairment without glasses), (ii) are not medically stable, (iii) have a documented diagnosis of major depression or (iv) have a documented history of dementia or significant cognitive decline, traumatic brain injury or previous aphasia at the time of admission for the acute event, (v) or are a participant in a research study that will influence this study's outcomes. Patient participant recruitment will follow the patient participant consent procedure (see document: SD_Communication Enhanced Environments after Stroke consent procedure version 1_3-2-15). A record of identifying participant details attached to patient codes will be kept at the hospital site in a locked filing cabinet. An email summary of the baseline assessment results will be sent to the hospital speech pathology generic email address. The patient will be identified by patient code and ward/room number. The hospital speech pathology team will write a summary of the assessment results in the patient's integrated medical progress notes.

Patient data collection: All recruited patient participants will complete the NIH Stroke Scale³ (by someone trained in using this tool) and the Montreal Cognitive Assessment (MoCA).⁴ Participants with aphasia will also complete an

1 assessment of aphasia, the WAB-R¹ and provide a personal narrative language sample on their reason for admission
2 to confirm a diagnosis of aphasia. After patient recruitment has been completed, the Chief Investigator and/or
3 trained medical team members will recruit the patient's family, friends and significant others to consent to video
4 recording and observations of their interactions with patient participants.
5
6
7

8 Observations of patient participants will commence 1-3 days after obtaining written consent. Patients' behaviour will
9 be observed by the Chief Investigator or a Research Assistant, and video recorded for a total of 12 hours to enable
10 behaviour mapping of video data (see document: Observation_protocol_SD_version 3_23-02-16). Patients will be
11 observed and video recorded for 4 hours per day on weekend day and two consecutive weekdays between 7am to
12 7pm. The observation periods will be grouped into 4-hour observation intervals (e.g. 7am-11am, 11am-3pm and
13 3pm-7pm). Each day the patient will be observed and video recorded for one observation interval. The participant
14 will be observed and video recorded during a different observation interval each day to gain a general insight into
15 the patients' activities (see Figure 1. below). Patients who do not consent to video recording will be provided with
16 the option of audio recording and manual observation conducted by the researcher to enable the collection of case
17 notes regarding patient behaviour. An observational protocol developed for this study will be used to measure the
18 frequency patient participants engage in language activities. These will be categorised into *solitary language*
19 *activities* for example reading, writing, listening to the radio, use of iPad applications, and *interactive language*
20 *activities* defined as i) an interaction involving an exchange of information, ii) with a communication partner
21 including gesture and/or facial expression, reading, writing or drawing for the purpose of communication and use of
22 technology including talking on the telephone. The observational protocol will be based on the behavioural mapping
23 techniques of Janssen et al.⁵ Patients' solitary and interactive language activities will be recorded in 5-minute
24 intervals and activity observed within the first minute of the observation interval will be recorded on a checklist of
25 the predetermined behaviours. Semi-structured supported conversation interviews for patient participants will be
26 conducted within 5 days of the last observation. The interviews will explore patients' perceptions of environmental
27 barriers and facilitators to language activities and communication and their experience of communication on the
28 acute and rehabilitation wards.

44

45 IMPLEMENTATION:

46 A model of a CEE will be implemented within the acute and rehabilitation wards. The model will be developed as
47 part of the research project. We hypothesise that our model of CEE will include the provision of:
48

- 49 i) CEE equipment, for example reading materials such as books and magazines, access to a computer with internet
50 and access to a communal dining area,
51
- 52 ii) CEE education, support and training for staff, patients and their family, friends and significant others with the aim
53 to develop the ability to support and facilitate 'language activity' and 'communication activity' for patients after
54 stroke. This will be accessible via multiple modalities including one-on-one training and group training sessions, as
55 well as through the provision of video and written resources. A questionnaire will be administered pre and post
56 training in order to determine staffs' perceptions of changes in their knowledge, skills and attitude towards
57
58
59
60

communication and aphasia. Additionally, feedback regarding the content and format of the training program will be obtained through questionnaires administered after the completion of the training program. Training and support provided in the implementation phase will be continued until the end of the intervention phase.

POST-IMPLEMENTATION:

Staff participant semi-structured interviews and focus groups will be conducted. Staff will participate in a one-hour semi-structured interview or a one-hour focus group to explore staff perceptions of environmental barriers and facilitators to language activities and communication.

The procedures for participant recruitment and data collection during the post-implementation phase will replicate those used in the baseline phase.

There is no travel commitment for all participants as all data collection and training will be conducted at the hospital.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday
1	7am-8am	PWA1	PWA3	PWA2
	8am-9am	PWOA1	PWOA3	PWOA2
	9am-10am			
	10am-11am			
2	11am-12pm	PWA2	PWA1	PWOA
	12pm-1pm	PWOA2	PWOA1	PWOA3
	1pm-2pm			
	2pm-3pm			
3	3pm-4pm	PWA3	PWA2	PWA1
	4pm-5pm	PWOA3	PWOA2	PWOA1
	5pm-6pm			
	6pm-7pm

Communication Enhanced Environments after Stroke consent procedure**Version 1_3-2-15****Patient participants**

The following consenting procedure will be used for all participants who are identified as potential research participants. Recruitment will only be completed by the Chief Investigator.

1. Check the patient meets the inclusion criteria and exclusion criteria.
2. Read the participant information sheet to the patient. Use the pictures on the participant consent form to support their comprehension of verbal information. Use gesture, written and pictorial support to facilitate verbal communication as required.
3. Provide the person responsible with the person responsible information sheet and consent form.
4. Provide time for the patient and the person responsible to discuss the study and ask questions to their satisfaction.
5. Ask the patient if they consent to the study using simple closed questions (e.g. "Do you understand what the study is about?", "Do you have any questions about the study?", "Do you want to be in the study?", "Will you sign the form?"). Use multi-modal communication strategies and repeat information/questions as required. Use the pictures on the participant consent form to support patient comprehension of verbal information.
6. If the patient agrees to participate in the study, ensure they sign the consent form witnessed by someone independent of the study.
7. Provide the patient with a copy of the information sheet and consent form for their own records.
8. Add the participant study number to the consent form
9. Store the signed consent forms in a locked cabinet at the hospital site. This cabinet will only be accessible by the research investigators.

Investigating Communication Enhanced Environments after stroke

Observation Protocol version 3_ 23-2-16

During the baseline and intervention period, patients’ behaviour will be observed and video recorded for a total of 12 hours. Patients who do not consent to video recording will be provided with the option of audio recording and manual observation. This will enable the collection of relevant notes about factors that might influence the interactions that may not be captured in the video or behavioural mapping, for example the context of the interactions or details about the environment.

Patients will be manually observed and video recorded for four hours per day on two weekdays and one weekend day between 7am to 7pm. The observations will be grouped into three x 4-hour observation intervals (e.g. 7am-11am, 11am-3pm, 3pm-7pm). Each day the patient will be observed and video recorded for one of the 4-hour observation intervals. The 4- hour observation period will be split into 5-minute intervals. All language and communication activity observed within the first minute of the 5-minute interval will be recorded on the behavioural mapping sheet with predetermined behaviours (Appendix 1). The free smart phone app ‘Impetus’ can be used to time 1-minute observations. You can set the timer to vibrate briefly when the 1-minute observation interval begins and ends.

Observation times (see Figure 1.) will be randomly selected by drawing out of an envelope. This will be conducted by the primary investigator prior to commencing patient observations. It may not be possible to observe the patient during the planned observation time, for example as a result of scheduled testing or home visits. If this occurs, patients can be observed during the next available observation interval. Changing or modifying the observation schedule should be avoided where possible.

Observation interval	Observation time	Day 1: Sunday	Day 2: Monday	Day 3: Tuesday
1	7am-8am	*PWA1	PWA3	PWA2
	8am-9am	**PWOA1	PWOA3	PWOA2
	9am-10am			
	10am-11am			
2	11am-12pm	PWA2	PWA1	PWA3
	12pm-1pm	PWOA2	PWOA1	PWOA3
	1pm-2pm			
	2pm-3pm			
3	3pm-4pm	PWA3	PWA2	PWA1
	4pm-5pm	PWOA3	PWOA2	PWOA1
	5pm-6pm			
	6pm-7pm			

Figure 1. Observation schedule

*PWA: patient with aphasia

**PWOA: patient without aphasia

DISCOURSE SAMPLE

1
2 You must collect a personal narrative discourse sample for each participant at the beginning of the first observation.
3
4 Once you have set up the video camera and have started recording, ask the patient “what has brought you into
5 hospital?”. Once the patient has finished telling you their personal narrative, tell the patient you will now start the
6 observations.
7
8
9

VIDEO RECORDING SET-UP

10
11
12
13
14 Place the video camera facing the patient approximately 1-2 metres away from them. Ensure the camera is placed in
15 an area where it is unlikely to be moved for the duration of the observation time (for example at the end of the
16 patient’s bed). Ensure the camera frame is capturing the patient as well as their surroundings (e.g. potential
17 communication partners, visitors, etc). If the patient relocates, reposition the camera to ensure the patient and their
18 surroundings remain in frame. Observe and manually record the patient’s behaviour and their environment
19 according to the procedure for behavioural mapping.
20
21
22

23
24 Do not record the patient in the bathroom or shower or during any other inappropriate circumstances (this may
25 include sensitive conversations, culturally sensitive situations or if the patient requests). If the patient indicates that
26 they don’t want to be recorded or becomes agitated, upset or distressed, use the ‘withdrawal from observations
27 visual resource’ (if appropriate) and ask the patient:
28
29
30

- 31 1. Do they want you to stop video recording?
- 32
33 2. Do they want to be manually observed and audio recorded instead?
- 34
35 If the patient responds ‘no’, ask the patient-
- 36
37 3. Can you come back another time to observe them?
- 38
39
40
41
42
43
44

45 If the patient asks you to stop recording you must cease recording immediately. The patient may allow you to
46 continue with manual observations or come back another time to complete the observations. If the patient allows
47 you to complete manual observations and audio recording, follow the audio-recording set-up and protocol below.
48
49
50
51

AUDIO RECORDING SET-UP AND PROTOCOL

52
53
54 This protocol is to be followed if the patient or their family indicate they do not want to be video recorded however
55 agree to audio recording and manual observations. Place the cap on the video camera and continue recording in
56 order to capture audio. If using a battery-operated audio recorder, place it on a table close to the patient (within 1
57 metre). Ensure the audio recorder is placed in a location where it will not be touched or moved throughout the
58
59
60

1 observation time. Observe and manually record the patient's behaviour and their environment according to the
2 procedure for behavioural mapping. Ensure spare batteries for the audio recorder are available if required.
3
4
5

6 **COMMUNICATION PARTNERS AND VISITORS**

7
8 Take note of all communication partners and visitors who have provided consent to video recording and/or
9 observations of their patient interactions. If someone enters the room during recording politely interrupt the
10 interaction, introduce yourself and inform the person that the patient is being video recorder recorded as a part of
11 the study the patient has agreed to participate in. Ask the visitor if they would like to go out of the room with the
12 researcher to find out about the study and the video recording. Provide a verbal explanation of the study and
13 provide the 'Visitors/communication partners' information and consent form'. Offer the visitor the option of no
14 video or manual recoding during their interaction with the patient. If the person chooses not to participate in
15 manual or video observations inform the person that any incidental recordings of them will be deleted and will not
16 be included in the study. The researcher will step out of the room for the duration of their visit.
17
18
19
20
21
22
23
24
25

26 **PROCEDURE FOR BEHAVIOURAL MAPPING**

- 27 • Position self where the patient can be clearly observed
- 28 • Remain inconspicuous as possible
- 29 • Circle ALL appropriate components on the observation schedule in regards to location, activity, people
30 present and details of language and communication observed within the first minute of each five-minute
31 interval.
- 32 • You can circle more than one key per section if required (except for location).
- 33 • If you require a toilet break, leave the camera recording while you take a break. If you miss a 1-minute
34 observation, place a line through the observation interval on the behavioural mapping sheet and write
35 'unobserved-toilet break'.
36
37
38
39
40
41
42
43
44
45

46 **TIME**

- 47 • Write the time at the beginning of the 1-minute observation interval

48 **LOCATION**

- 49 • Circle only one location
- 50 • If the patient is moving between two locations, circle the location the patient is moving towards

51 AMENITIES: Toilet, shower.

52
53
54
55
56
57
58
59 BEDROOM: Around the patient's room or bed. If the patient is outside of their doorway this is considered 'hall'.
60

1 HALL: Any hallway within the hospital ward.

2 THERAPY AREA: In an allied health therapy session, including occupational therapy, physiotherapy, speech
3 pathology, nursing.

4 FAMILY MEETING ROOM: Family meeting room.

5 DOCTOR'S ROOM: Doctor's office.

6 DINING ROOM: Dining room during meal times or any other time.

7 COMMUNAL AREA: Communal dining area.

8 OUTSIDE: Outside areas including the garden, car park.

9 OFF UNIT: Off-site locations, home visits, testing off site.

10 OTHER: Anything that doesn't fit into the above categories-provide description of location.

11 PEOPLE PRESENT

12 People present include any person that is near the patient and is able to have an interaction with the patient. If you
13 do not know how to classify the person make a note to check with staff at a later time and complete the observation
14 schedule.

15 **Exceptions:** People who are near the patient but are unable to interact with the patient, e.g. cognitive or behavioural
16 issues, barriers between person and the patient preventing them from interacting- e.g. curtain drawn, people in the
17 way. If an interaction is occurring despite objects in the way, the communication partner is considered as a 'person
18 present'.

19 PEOPLE PRESENT: Nurse, nurse assistant, doctor, physio (physiotherapist), OT (occupational therapist), SP (speech
20 pathologist), DT (dietician), SW (social worker), family/friend, other patient, alone (no-one present that is conducive
21 to interactions), other (describe).

22 ACTIVITIES

23 UNOBSERVED: If you are unable to observe the patient. Place a line through the observation
24 interval and write unobserved.

25 NO LANGUAGE ACTIVITY: If the patient is observed not engaged in any communication activity.

- 26 • Circle 'no activity' on the checklist
- 27 • Write what the patient is doing, e.g. 'sleeping'

28 INTERACTIVE LANGUAGE ACTIVITIES: Defined as an interaction involving an immediate communicative exchange
29 with a communication partner. Interactive language activities may include talking, gesture and/or facial expression,
30 reading, writing or drawing for the purpose of communication, use of communication aids or AAC devices and use of
31 technology including talking on the telephone. Non-verbal gesture or facial expression includes eye contact to

1 initiate interactions, hand gestures (e.g. waving, thumbs up), body movements for the purpose of conveying a
2 communicative message (e.g. shrugging) and/or facial expressions for the purpose of communication.

3 Communication aids or AAC devices includes any use of alternative and augmentative devices for the purpose of
4 communication, e.g. high-tech or low-tech AAC devices such as letter boards, pictures/photos, whiteboard, writing
5 or drawing, smart phones, iPad. Please describe communication aids observed.
6
7

8
9 OTHER FUNCTIONAL COMMUNICATION ACTIVITIES: All other communication activities that do not involve a direct
10 immediate communicative exchange with a communication partner. Functional communication activity may include
11 reading, typing/writing, emailing, internet use, watching TV, listening to talking on the radio. Note the patient must
12 be looking directly at the TV to be considered 'watching TV'. If the TV is on in the background, do not include this as
13 'watching TV'.
14
15

16
17 NON-FUNCTIONAL/NON-PROPOSITIONAL LANGUAGE ACTIVITIES: Singing, word games (carried out alone), language
18 apps (used alone), copying written letters, words or sentences (carried out alone).
19
20

21
22 OTHER: Communication or language activities that do not fit the criteria of interactive language activity, 'other'
23 functional communication activities, non-functional/non-propositional language activities or may be a confounding
24 variable (for example, talking to self and talking to the observer). If a patient is talking to themselves, note if this is
25 appropriate (for example, saying 'excuse me' after burping) or inappropriate (for example, an extensive monologue)
26 and describe the context. If the patient's verbal output is inaudible, write this in the space underneath 'talking to
27 self'.
28
29
30
31

32
33 **Note:** If the patient is using a computer, phone, smart device, or iPad where the activity they are engaged in (e.g.
34 texting, emailing, playing a game, etc) cannot be accurately determined, note this in the comments section. After the
35 1-minute observation interval has been completed ask the patient if they mind sharing if what activity they were
36 completing on their device and record this in the relevant section. If the patient does not wish to share this
37 information with you, record this in the 'other' section.
38
39
40

41 **COMMENTS**

42
43 Describe the context of the interactions or details about the environment in the comments section. This will provide
44 information regarding factors that may influence the interactions, for example 'background noise'. Additionally,
45 write down any information that may be missed in the video data, for example, people out of the camera frame,
46 interactions that may be overheard in the room that might impact on the current interactions.
47
48
49

50
51 Draw a line under the final comment after the one-minute observation had been completed. Write any additional
52 observations within the final 4 minutes below this line (see example).
53
54
55

56
57 If you have any queries or questions regarding this observation protocol or the observation protocol please contact
58 chief investigator Sarah D'Souza.
59
60

Patient participant information and consent form

Communication activity in hospital

This research project is being undertaken as **part of the requirements** of a **PhD at Edith Cowan University**.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

1 You are **invited** to participate in a research project. Sarah D'Souza, a
2 speech pathologist and PhD student is leading the study as Chief
3 Investigator. This study has received ethical **approval** from **ECU** Human
4 Research **Ethics Committee** and the Hollywood Private Hospital
5 Research Ethics Committee.
6
7
8
9

10
11
12
13
14 This project is investigating the **hospital environment** to see how this
15 **influences** patient **communication activity**. Communication activity
16 involves communication, such as **talking** with other patients,
17 **socialising**, **reading** the paper, using the **telephone**, talking to staff, or
18 engaging in group activities including **therapy**.
19
20
21
22
23
24

25
26
27 **You** have been **selected** to participate as you have had a **stroke** and
28 are receiving **treatment at Hollywood Private Hospital**. We are
29 **interested** in seeing **how** the hospital **surroundings affect what you**
30 **do** throughout the day.
31
32
33
34
35

36 37 **What would you have to do?**

38
39
40 You will be **asked** to provide **consent** to **agree to participate** in the
41 study.
42
43
44

45 You will be **asked to consent** to:
46
47
48
49

- 50
51 • Complete **three tests** to see how your stroke has affected **you**
52 including your **language, concentration** and **memory**. These tests
53 will be conducted at the **beginning of the project**. The tests will take
54 approximately **1 hour** to complete with an option to complete the tests
55
56
57
58
59
60

1 over **two separate 30 minute sessions** and with as many **breaks** as
2 you may need.
3
4
5
6

- 7
8 • A **researcher** spending approximately **1 hour discussing with you**
9 your **opinion** regarding **how** your rehabilitation **surroundings affect**
10 **your stay in hospital** and **your communication activity** levels.
11
12
13
14
15
16 • A researcher **video recording, observing** and **writing down** what is
17 happening in your **environment** including **your activities**. You will be
18 observed and recorded for a total of **12 hours** over **3 days**.
19
20
21
22
23
24
25

26 You may **not want** to be **video recorded**. If you **request**, you will
27 **not be video recorded**. You can ask not to be video recorded at **any**
28 **time**. In this case the researcher will **only observe, audio record**
29 and **write down** what is **happening in your** environment **including**
30 your activities.
31
32
33
34
35
36
37
38
39

- 40 • A researcher **looking at your hospital medical file** to collect
41 **information** regarding:
42
43 • Your **details** (such as your age, your living arrangements, your
44 occupation and your level of functioning before your stroke)
45
46 • Any **conditions** or **diseases** you may have
47
48 • Information about your **stroke** (for example when it happened, the
49 **area** of the **brain** affected, how it has **affected your functioning**
50 and **abilities**)
51
52 • Details about **how long** you have **been in hospital** since your
53 stroke
54
55
56
57
58
59
60

1
2
3 If you decide to participate in this study, you **will not miss out** on any
4 **treatment**. Participation will **not cost** you **anything** and **after**
5
6
7 completing the **tests** and the **interview** you will be asked to continue
8
9 participating in your **normal activities**.
10

11
12
13
14
15 We will **not record** if you are **behind closed curtains** or completing
16
17 sensitive tasks such as when you are in the **toilet** or **shower**.
18
19

20
21
22
23 We may use the **recordings** of **you** to make a **training package**
24
25 (including a video). You can have **your face blurred out** if you want. If
26
27 you **do not want** to be in the training package we will **not include you**
28
29 in the training package or video.
30

31
32
33
34
35 Your hospital **discharge** will **not be affected** because you are in this
36
37 study. **You** will be **discharged** from hospital when the hospital **medical**
38
39 **team decides** that you are **ready**.
40

41
42
43
44 There are **no known risks** of participating in this study. If you feel
45
46 uncomfortable at any time, you are free to **tell the researcher** and
47
48 **observations** within your room will **stop immediately**. You may
49
50 become **upset** during the **tests** or the **interview**. If this happens you
51
52 can **ask** to take a **break or stop** the interview.
53
54

55
56
57 There will be **no immediate benefit** to you from participating in this
58
59 research; however your participation will allow the collection of
60

1 information that may **help improve** stroke **hospital wards** which may
2 **benefit** future stroke survivors.
3
4
5

6 **Participating** in this study is completely **voluntary**. You **do not have**
7 **to** participate if you don't want to. If you decide to participate you may
8 **withdraw** at **any time** without giving a reason and withdrawing **will not**
9 **disadvantage** you in any way and will **not affect** your hospital
10 **treatment**. If you **decide** that you do **not want to participate** in the
11 study, you **can ask to remove** all of your **information** from the study.
12
13
14
15
16
17
18
19
20
21

22 All the **information** you give will be **confidential**. You will **not be**
23 **identified** by name. You will be **assigned** a unique **code** and any
24 information that may reveal your **identity** will be **removed**.
25
26
27
28

29 All personal health information will be accessed, used and stored in
30 accordance with Commonwealth Privacy Laws. **Information** from all the
31 people in the study is **combined** and **summarised**.
32
33
34
35
36
37
38

39 We will **store** all your electronic **information** on a **password locked**
40 **computer** and **password locked hard drive only accessible by the**
41 **Chief Investigator**. Your hard copy information will be **kept** in a **locked**
42 **cabinet** at Edith Cowan University. Your information will **only** be
43 **accessible to researchers** named on **this study**.
44
45
46
47
48
49
50
51
52

53 The **results** of this study may be **published** in research **journals** or
54 presented at **conferences**. Your **name** will **not** be **used**.
55
56
57
58
59
60

1 **Data** may be **used** in higher degree by **research studies** in the **future**.
2 **Confidentiality** will be **maintained** and no identifying information will
3 be used.
4
5
6
7
8
9

10 **Data** will be **accessible by researchers** through data sharing archives.
11 This data will be governed by an overarching body to ensure data is **only**
12 **used for approved research** purposes. Researchers who access this
13 data from the data bank will not have access to participant information
14 and therefore **will not know your identity**.
15
16
17
18
19
20
21
22
23

24 **Read** this information and be sure you **understand** its content **before**
25 you **agree** to participate in this study.
26
27
28
29
30
31

32 If **you** would **like** to **participate** in this study, please **sign the form**
33 below and **return** it to a **staff** member or a member of the **research**
34 **team**.
35
36
37
38
39
40

41 **Questions or further information?**

42 You **may wish** to **discuss** this information with your **doctor, a relative**
43 **or friend before agreeing** to take part in this study.
44
45
46
47
48
49

50 If you are interested in participating, please tell the researchers. If you
51 have any questions or require any further information about the research
52 project, please contact: Sarah D'Souza [Ph: 0439 982 451].
53
54
55
56

Person responsible information sheet
Patient communication activity in hospital after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccione	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

The participant is invited to take part in a research project. Sarah D'Souza, a Speech Pathologist and PhD student, is leading the study as Chief Investigator. This study has received ethical approval from ECU Human Research Ethics Committee and Hollywood Private Hospital Research Ethics Committee.

This project is investigating the hospital environment to see how this influences patient activity.

The participant has been selected to take part in this study as they have had a stroke and are receiving treatment at Hollywood Private Hospital. We are interested in

1 seeing how the hospital surroundings affect their communication activity throughout
2 the day. Communication activity involves communication, such as talking with other
3 patients, socialising, reading the paper, using the telephone, talking to staff, or
4 engaging group activities including therapy.
5
6
7
8

9 This information sheet will explain the research project and will detail what is involved in the
10 study. You will be given a copy of this information to keep for your reference.
11
12
13
14

15 Please read through all of the information carefully. You can ask the researcher questions
16 about the study at any time.
17
18
19
20
21

22 **Purpose of the research**

23
24 Little is known about the impact of the hospital rehabilitation environment on patient
25 communication activity levels during stroke recovery. This study will investigate how the
26 hospital stroke ward environment influences patient communication activity levels. The
27 information gathered from this study will assist in improving the Hollywood Private Hospital
28 stroke ward environment to help the recovery of stroke survivors in the future.
29
30
31
32
33
34
35

36 **What does the patient have to do?**

- 37
38
39
40 • Complete three tests and a recording of them talking to see how their stroke has
41 affected their functioning including their language, concentration and memory. These
42 tests will be conducted at the beginning of the project. The tests will take
43 approximately 1 hour to complete with an option to complete the tests over two
44 separate 30 minute sessions and with as many breaks as the participant needs.
45
46
47
48
49
- 50
51 • Spend approximately 1 hour discussing with the researcher their opinion regarding how
52 their rehabilitation surroundings affect their stay in hospital and activity levels.
53
54
55
- 56
57 • Allow the researcher to video record, observe and write down what is happening in the
58 participant's environment including their activities for a total of 12 hours over a 3 day
59 period. Video recording is a useful way of capturing the details of everyday activities on
60

1 the ward. Often, people forget that the camera is there. Obviously, personal or private
2 activity such as toileting would not be filmed. The participant may not want to be video
3 recorded. If they request, they will not be video recorded. In this case the researcher
4 will only observe, audio record and write down what is happening in their environment
5 including their activities.
6
7
8
9

- 10
- 11 • A researcher will look at the participant's hospital medical file to collect information
12 regarding:
13
 - 14 • The participant's details (such as their age, living arrangements, occupation and
15 level of functioning before stroke)
 - 16 • Any relevant conditions or diseases the participant may have
 - 17 • Information about the participant's stroke (for example when it happened, the
18 area of the brain affected, how it has affected their functioning and abilities)
 - 19 • Details about how long the participant has been in hospital since their stroke
- 20
21
22
23
24
25

26 The participant will not miss out on any treatment. Participation will not cost anything. After
27 completing the tests and the interview the participant will be asked to continue their normal
28 activities.
29
30
31
32

33 The participant's hospital discharge will not be affected because they are in this study. The
34 participant will be discharged from hospital when the hospital medical team decides that they
35 are ready.
36
37
38
39
40
41

42 There are no known risks of participating in this study. If the participant feels uncomfortable
43 at any time, you or the participant are free to tell the researcher and observations within
44 their room will stop immediately. The participant may become upset during the tests or the
45 interview. If this happens you or the participant can ask to take a break or stop the interview.
46
47
48
49
50
51

52 There will be no immediate benefit to you or the participant from taking part in this research;
53 however **their participation will allow the collection of information that may help**
54 **improve stroke hospital wards which may benefit future stroke survivors.**
55
56
57
58
59
60

1 Participating in this study is completely voluntary. The participant can withdraw from taking
2 part in the study at any time without giving a reason for withdrawing.
3
4
5

6 The participant can request access to their research data at any time. They can request any
7 of the information collected to be amended or removed if it is incorrect or they disagree with
8 it. Please contact Sarah D'Souza (phone: 0439 982 451) if you would like to discuss
9 accessing the participant's information.
10
11
12
13
14
15

16 The video, audio and written data will be identified by code. The information you provide will
17 remain completely confidential. There will be no identifying information attached to the data
18 and any information that may reveal the participant's identity will be removed. A list of
19 participant names and codes will be kept in a locked filing cabinet at Hollywood Private
20 Hospital and will only be accessible by the research team. All personal health information will
21 be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will
22 be stored on a password controlled computer or in a locked cabinet at Edith Cowan
23 University. Electronic data will be backed-up on a password controlled hard drive only
24 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after
25 completion of the study. Video and audio recordings will then be permanently deleted and
26 hard copy data will be shredded.
27
28
29
30
31
32
33
34
35
36
37

38 Non-identifiable data will be accessible by researchers through data sharing archives. This
39 data will be governed by an overarching body to ensure data is only used for approved
40 research purposes. Researchers who access this data from the data bank will not have access
41 to participant information therefore data will not be re-identifiable.
42
43
44
45
46

47 The results of this study may be published in research journals or presented at conferences.
48 The results will not include any information that may identify participants. Data may be used
49 in higher degree by research studies in the future. In this circumstance, confidentiality will be
50 maintained and no identifying information will be used.
51
52
53
54
55
56

57 Data collected from this study (including videos) may be used to develop training packages to
58 improve future stroke survivors' communication activity levels in the future. We can blur out
59
60

1 the participant's face if they want. If they do not want to be in the training package we will
2 not include them in the training package.
3
4
5

6 At the end of the research project a summary of the results will be provided to you and the
7 participant.

Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is exploring patient's experiences following stroke in regards to the environment of an in-patient stroke rehabilitation unit. We want to explore patients' communication activity, which includes activities such as talking with other patients and visitors, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy.

The participant has agreed to take part in this study. They have agreed to be video recorded for a total of 12 hours over a three day period.

Your interactions with the patient will be video recorded and manually recorded by the chief investigator to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. You do not need to do anything other than complete your usual tasks and activities. We will not record if you are having sensitive conversations with the participant, if they are behind closed curtains or completing sensitive tasks such as toileting or showering.

1 We may use the recordings of you to make a training package (including a video). You can have your face
2 blurred if you want. If you do not want to be in the training package we will not include you in the training
3 package.
4

5
6
7
8 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
9 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
10 without giving a reason and withdrawing will not disadvantage you or the participant in any way.
11
12
13

14
15 You may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you
16 may not benefit from participating in this study. There are no known risks associated with participating in
17 this study.
18
19
20
21
22

23 **Confidentiality of information**

24
25 The video, audio and written data will be identified by code. There will be no identifying information
26 attached to the data and any information that may reveal your identity will be removed. A list of participant
27 names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be
28 accessible by the research team. All data will be accessed, used and stored in accordance with
29 Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked
30 cabinet at Edith Cowan University. Electronic data will be backed-up on password controlled hard drive only
31 accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the
32 study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Staff information and consent form

Investigating Enriched Environments after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Researchers' contact details

Edith Cowan University		
Chief Investigator/ PhD student	Sarah D'Souza	Ph: 0439 982 451
Principal Supervisor	Professor Beth Armstrong	Ph: 08 6304 2769
Co-Supervisor	Associate Professor Natalie Ciccone	Ph: 08 6304 2047
Co-Supervisor	Associate Professor Erin Godecke	Ph: 08 6304 5901
Co-Supervisor	Associate Professor Deborah Hersh	Ph: 08 6304 2563
Hunter Stroke Service, University of Newcastle and Hunter Medical Research Institute		
Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is exploring staff and patient's experiences in regards to the environment of the Edwards and Woods wards at Hollywood Private Hospital. We want to explore patient communication activity, which includes activities such as talking with other patients, socialising, reading the paper, using the telephone, talking to staff, or engaging group activities including therapy. We would like to explore staffs' perceptions of barriers and facilitators to communication activity on the wards and address these in order to enhance the ward environment.

Staff have been selected to participate in order to gain a range of perspectives in regards to the day to day operations, procedures, policies and interactions that influence the environment of the Edwards and Woods wards. A training program for staff will be designed to address barriers and facilitators identified on the wards.

There are two components of this research study that involve staff. You may wish to consent to participate in one or both parts of this study.

1
2
3 **Part 1:** Patients will be video recorded for a total of 12 hours over a three day period. Your interactions with
4 the patient will be video recorded and manually recorded by a member of the research team to explore
5 patient communication activity levels. You can choose to be observed by the researcher only if you do not
6 want to be video recorded. You do not need to do anything other than complete your usual daily tasks and
7 activities. We will not record if you are behind closed curtains or completing sensitive tasks such as toileting
8 or showering the patient.
9
10
11
12
13
14

15 We may want use the recordings of you to make a training package (including a video). We will show you
16 the video we want to use and explain exactly how this will be used before we do anything. You can have
17 your face blurred out if you want. If you don't want to be included in the training package we will not include
18 any videos of you in the training package.
19
20
21
22
23

24 **Part 2:** You will be asked to take part in the following:
25

- 26 • A focus group with the researcher and your co-workers for approximately 1 hour to explore your
27 perceptions of environmental barriers and facilitators to activity.
- 28 • Attend a training program for approximately 1.5 hours. This will focus on training staff to promote
29 patient communication on the ward. This session will be located at Hollywood Private Hospital and
30 will be offered over several dates to facilitate your ability to attend. If you are unable to attend the
31 training program we may provide training and video resources to facilitate your participation in
32 training.
- 33 • Complete an anonymous short questionnaire before and after attending the training program to gain
34 feedback on training and explore your perception of changes in your knowledge, skills and attitudes
35 towards communication and aphasia.
- 36 • A final focus group with the researcher for approximately 1 hour to again explore your perceptions
37 of environmental barriers and facilitators to activity.

38 The focus groups will be tape recorded however at any stage you may ask for the tape to stopped,
39 edited or have your comments erased.
40
41
42
43
44
45
46
47
48
49
50

51 There will be no cost to you associated with the investigation. Participation is completely voluntary. You do
52 not have to participate if you don't want to. If you decide to participate you may withdraw at any time
53 without giving a reason and withdrawing will not disadvantage you in any way.
54
55
56
57
58

59 You may benefit from gaining knowledge and skills regarding communication from attending the training
60 program. Additionally, you may also benefit from the knowledge that you are helping future stroke

1 survivors. It is possible that you may not benefit from participating in this study. There are no known risks
2 associated with participating in this study.
3
4
5

6 **Confidentiality of information** 7

8 The information you provide during the interviews will be audio recorded by the Chief Investigator. Your
9 perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'. This will be
10 used to inform the development and review of the training program.
11
12
13

14
15
16 The video, audio and written data will be identified by code. The information you provide will remain
17 completely confidential. There will be no identifying information attached to the data and any information
18 that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked
19 filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be
20 accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a
21 password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be
22 backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be
23 stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be
24 permanently deleted and hard copy data will be shredded.
25
26
27
28
29
30
31
32

33 Non-identifiable data will be accessible by researchers through data sharing archives. This data will be
34 governed by an overarching body to ensure data is only used for approved research purposes.
35 Researchers who access this data from the data bank will not have access to participant information
36 therefore data will not be re-identifiable.
37
38
39
40
41
42

43 The results of this study may be published in research journals or presented at conferences. The results
44 will not include any information that may identify participants. Data may be used in higher degree by
45 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
46 information will be used.
47
48
49
50
51

52 A summary of the results will be provided through Hollywood Private Hospital 18 months after the
53 completion of the study.
54
55
56
57

58 Please read this Information Statement and be sure you understand its content before you consent to take
59 part.

Yes No **Video recording** of your interactions with patients following stroke.

Part 2:

Yes No Complete two focus groups with the researcher, complete two short questionnaires and attend a training program.

I understand the project will be conducted as stated in the information letter, a copy of which I have retained.

I understand I can withdraw from the project at any time and do not have to give a reason for withdrawing.

I understand personal information will remain confidential to the researchers.

I have been given the opportunity to raise any questions or concerns I have and am satisfied with the responses I was given.

Investigating Enriched Environments after stroke

This research project is being undertaken as part of the requirements of a PhD at Edith Cowan University.

Adjunct Supervisor	Dr Heidi Janssen	Ph: 02 40420417

Description of the research project

This study is a Communication Enhanced Environment (CEE) at Hollywood Private Hospital. A CEE involves several initiatives that aim to provide more opportunities for communication for stroke survivors on the ward. One of these initiatives involves the participation of volunteers.

As a volunteer participant, you will be asked to take part in the following:

- Attend a training program for approximately 1.5 hours. This will focus on training volunteers in communicating with patients following stroke with communication difficulties. This session will be located at Hollywood Private Hospital and will be offered over several dates to facilitate your ability to attend. If you are unable to attend the training program we may provide training and video resources to facilitate your participation in training.
- Complete an anonymous short questionnaire before and after attending the training program to obtain your feedback on the training session.

- A focus group with the researcher and other volunteers for approximately 1 hour to explore your perceptions of communicating with patients following stroke. The focus group will be tape recorded however at any stage you may ask for the tape to be stopped, edited or have your comments erased.
- Host a communal dining and lounge area once a week to offer tea and coffee and provide social companionship for patients following stroke.
- Your interactions with the patient may be video recorded and manually recorded by a member of the research team to explore patient communication activity levels. You can choose to be observed by the researcher only if you do not want to be video recorded. We will not record if you are having sensitive conversations with the patient/s.

There will be no cost to you associated with participating in this study. Participation is completely voluntary. You do not have to participate if you don't want to. If you decide to participate you may withdraw at any time without giving a reason and withdrawing will not disadvantage you in any way.

You may benefit from gaining knowledge and skills regarding communication from attending the training program. Additionally, you may also benefit from the knowledge that you are helping future stroke survivors. It is possible that you may not benefit from participating in this study. There are no known risks associated with participating in this study.

Confidentiality of information

The information you provide during the interviews will be audio recorded by the Chief Investigator. Your perspectives and opinions will be analysed and grouped into common 'themes' and 'stories'.

The video, audio and written data will be identified by code. The information you provide will remain completely confidential. There will be no identifying information attached to the data and any information that may reveal your identity will be removed. A list of participant names and codes will be kept in a locked filing cabinet at Hollywood Private Hospital and will only be accessible by the research team. All data will be accessed, used and stored in accordance with Commonwealth Privacy Laws. The data will be stored on a password controlled computer or in a locked cabinet at Edith Cowan University. Electronic data will be backed-up on a password controlled hard drive only accessible by the Chief Investigator. Data will be stored for a maximum of 15 years after completion of the study. Video and audio recordings will then be permanently deleted and hard copy data will be shredded.

Non-identifiable data will be accessible by researchers through data sharing archives. This data will be governed by an overarching body to ensure data is only used for approved research purposes.

1 Researchers who access this data from the data bank will not have access to participant information
2 therefore data will not be re-identifiable.

6 The results of this study may be published in research journals or presented at conferences. The results
7 will not include any information that may identify participants. Data may be used in higher degree by
8 research studies in the future. In this circumstance, confidentiality will be maintained and no identifying
9 information will be used.
