

**HDAC4 degradation during senescence unleashes an epigenetic program driven by AP-1/p300 at  
selected enhancers and super-enhancers**

**Figure S1. Class IIa HDACs are dysregulated in different types of cellular senescence.**

**a.** Microscopic images of SA- $\beta$ -gal stained BJ/hTERT cells expressing the indicated transgenes for 2 or 8 days.

Scale bar 50  $\mu$ m.

**b.** mRNA expression levels of the indicated genes in the indicated BJ/hTERT cells. Mean  $\pm$  SD; n = 3.

**c.** Immunoblot analysis using the indicated antibodies of BJ/hTERT cells treated with H<sub>2</sub>O<sub>2</sub> (200 $\mu$ M) for 2h and harvested after 4 days. SA- $\beta$ -gal is indicated. Vimentin was used as loading control.

**d.** Immunoblot analysis using the indicated antibodies of BJ/hTERT grown for 48 h. with a conditioned medium (1:1 conditioned/fresh medium) 48h) obtained from BJ/hTERT cells stably expressing HYGRO<sup>R</sup> or HRAS<sup>G12V</sup>. SA- $\beta$ -gal is indicated. Vimentin was used as loading control.

**e.** mRNA expression levels of the indicated genes in BJ/hTERT cells generated and treated as described in figure S1a. Mean  $\pm$  SD; n = 3.

**f.** mRNA expression levels of the indicated genes in BJ/hTERT cells generated and treated as described in figures S1c/d. Mean  $\pm$  SD; n = 3.

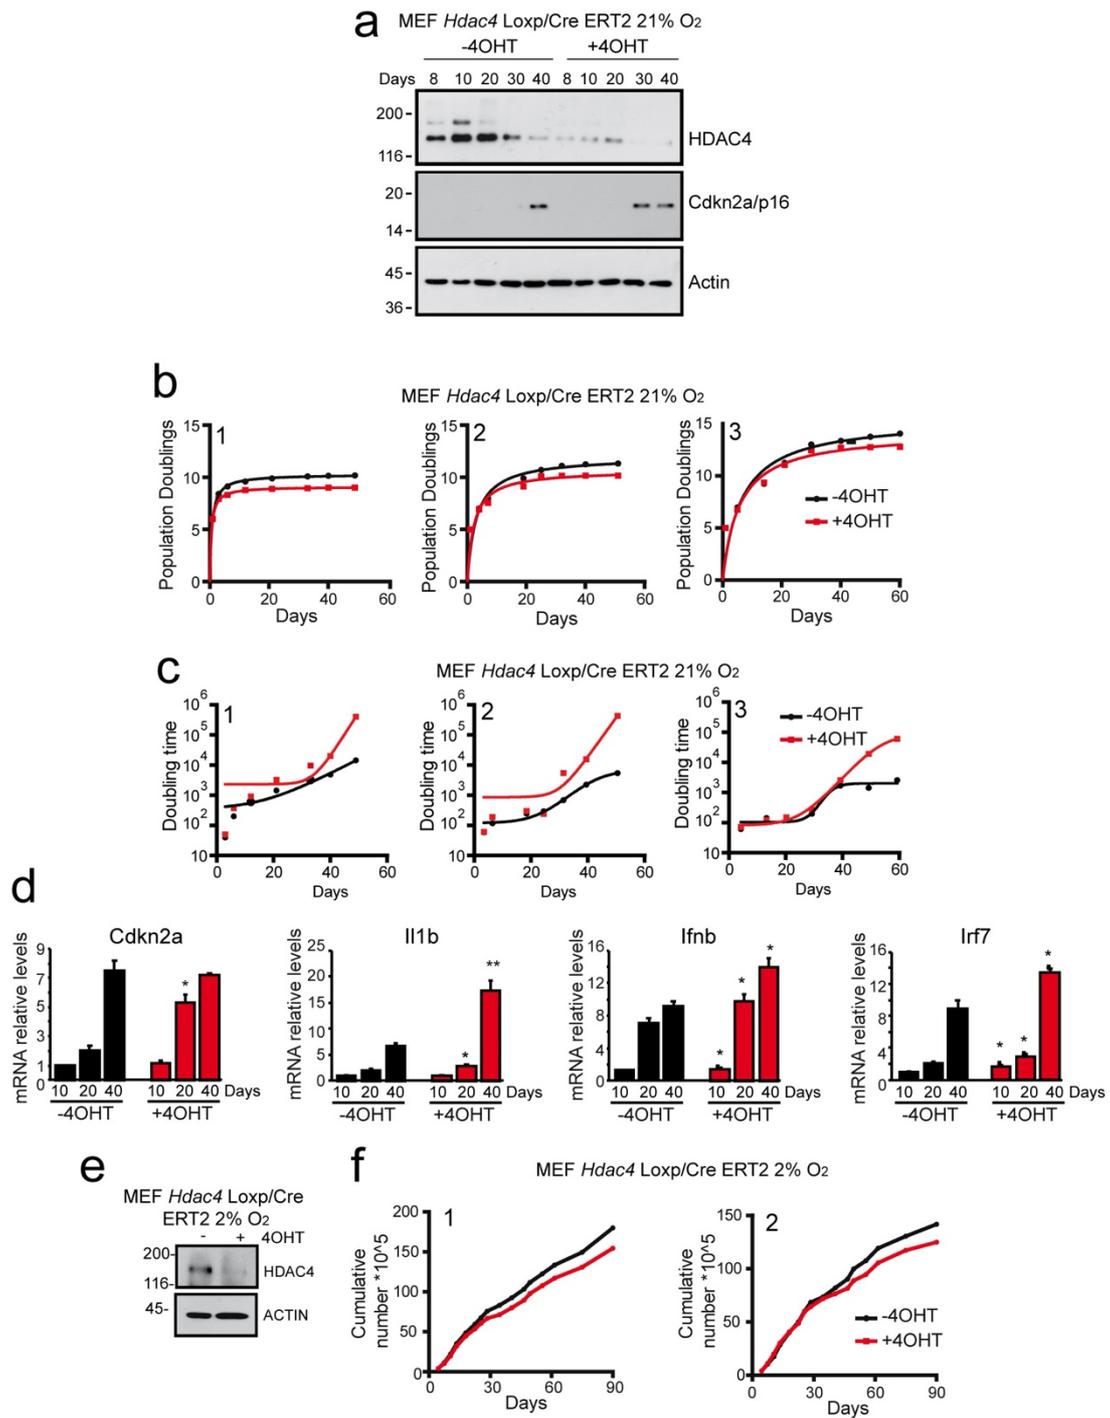

**g.** Heatmap summarizing the mRNA expression levels of Class IIa HDACs in respect to control cells. Mean  $\pm$  SD; n = 3. RS= replicative senescence; RIS= RAS-induced senescence.

**h.** Immunoblot analysis of HDAC4 and Actin in the input (1/100 total lysate) related to the immunoprecipitation shown in figure 1i.

**i.** Immunoblot analysis of HDAC4 and LMNB1 in BJ/hTERT cells expressing for 6 days the indicated transgenes and treated for the last 12h with LiCl (10mM) and/or MG132 (1 $\mu$ M), as indicated. Vimentin was used as loading control.

**j.** Immunoblot analysis using the indicated antibodies of BJ/hTERT-RAS-ER cells treated with 4-OHT for the indicated times. The indicated antibodies were used to evaluate the appearance of senescence and the phosphorylation of class IIa HDACs.

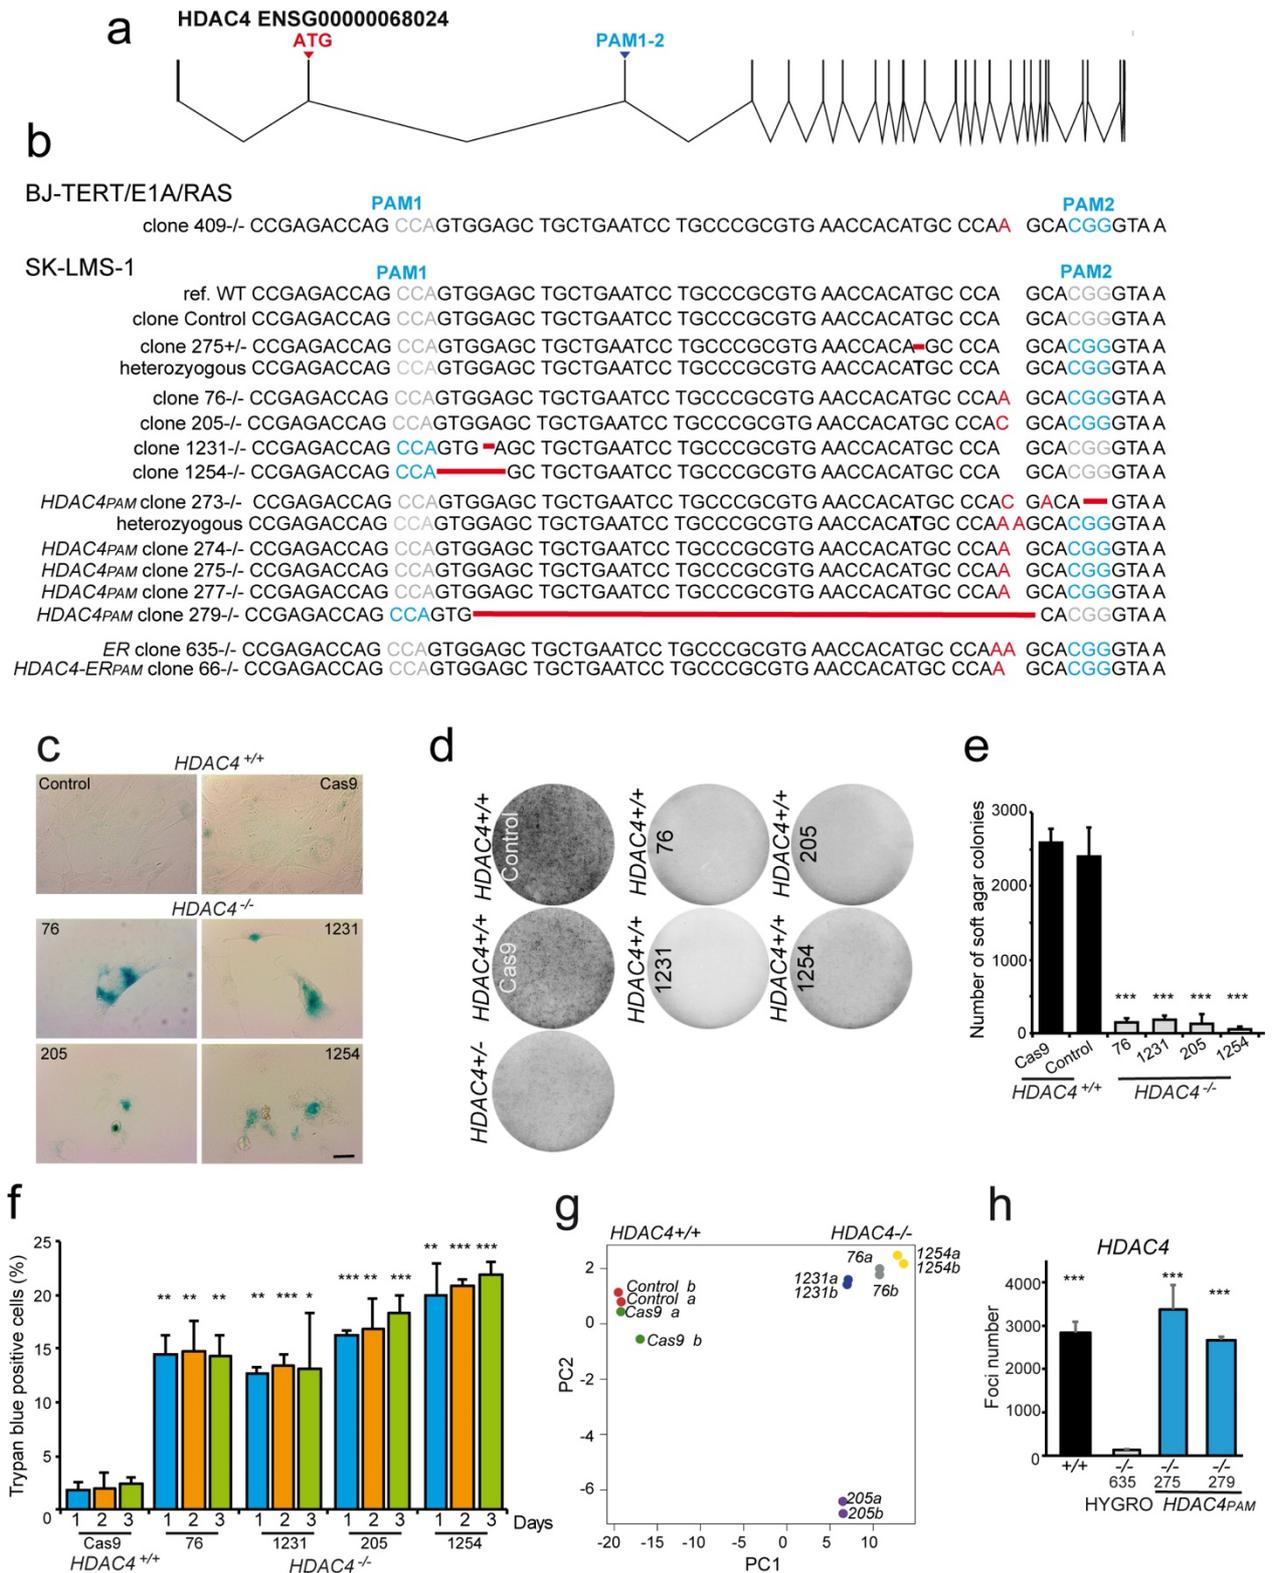

**k.** Immunofluorescence analysis of HDAC4 localization in BJ/hTERT-RAS-ER cells treated with 4-OHT for the indicated times. Confocal images were obtained with a Leica LSM SP8 and are shown in pseudocolors. Bar 25 $\mu$ m.

**Figure S2. The forced knock-out of HDAC4 allows premature senescence entrance.**

**a.** Immunoblot analysis of HDAC4 and p16 levels in MEF<sup>loxp/loxp</sup> x CreER T2 cells, maintained in normoxia and treated or not for 48h with 0.25 $\mu$ M 4-OHT at day 6 of culture and harvested after regular splitting at the indicated days. Actin was used as loading control.

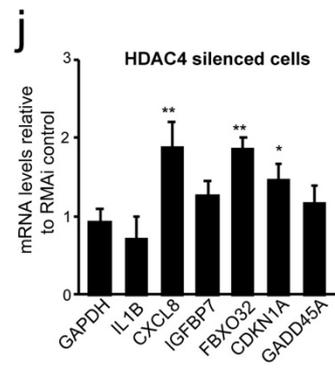

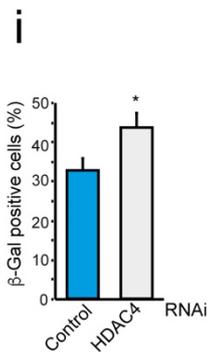

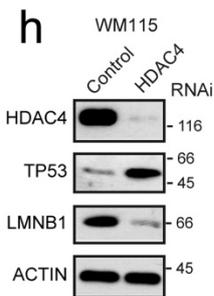

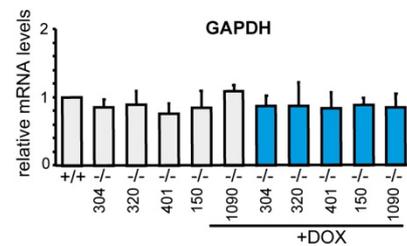

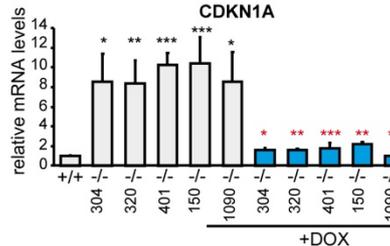

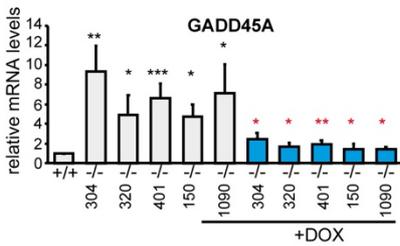

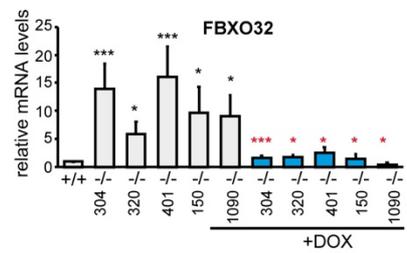

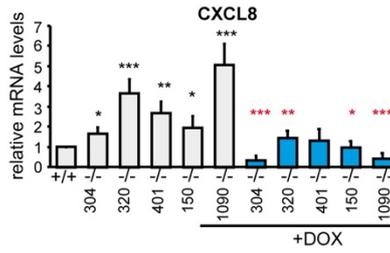

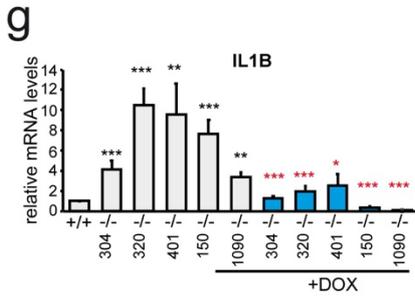

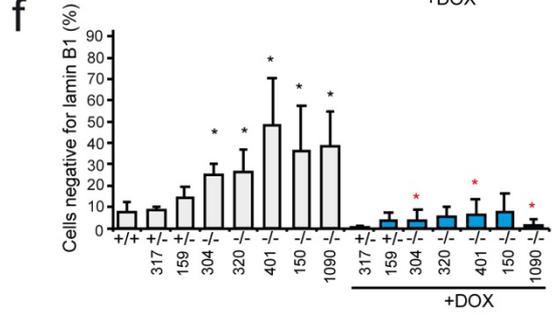

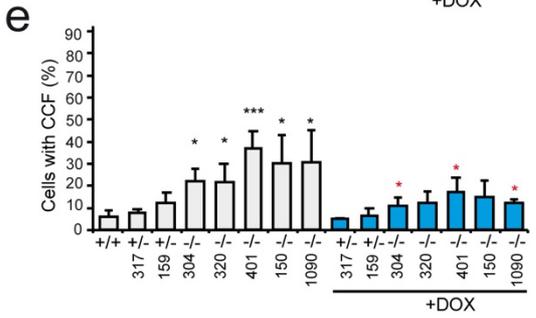

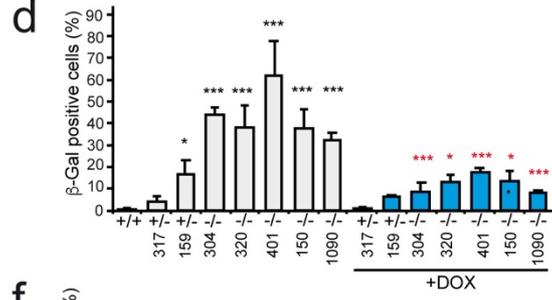

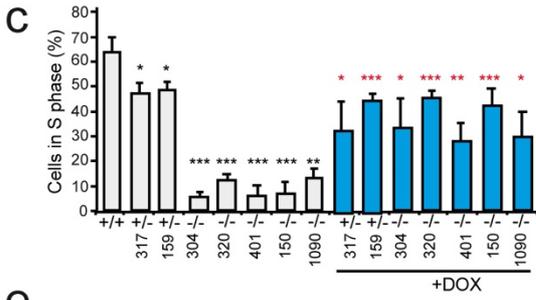

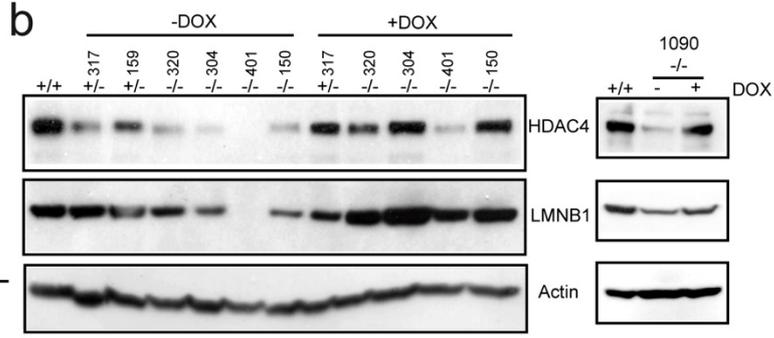

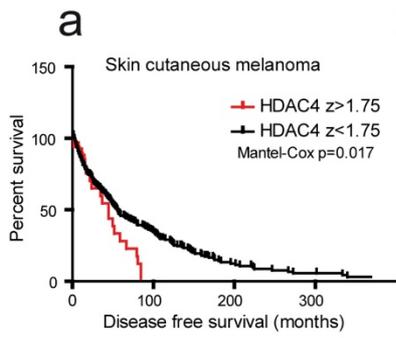

- b.** Analysis of the cumulative population doublings (**E**) or the doubling time (**F**) observed during the culture of three independent batches of MEF<sup>loxp/loxp</sup> x CreER T2 cells maintained as described in figure S2a. Third order polynomial regression curves are shown.
- c.** Analysis of the doubling time observed during the culture of three independent batches of MEF<sup>loxp/loxp</sup> x CreER T2 cells maintained as described in figure S2a. Sigmoidal regression curves are shown.
- d.** mRNA expression levels of the same MEF cells described in figure S2a. Mean ± SD; n = 2. For significance calculation, a paired comparison between WT and *Hdac4*<sup>-/-</sup> cells was made for each growth point.
- e.** Immunoblot analysis of HDAC4 levels in MEF<sup>loxp/loxp</sup> x CreER T2 cells, maintained in hypoxia and treated or not for 48h with 0.25μM 4-OHT at day 6 of culture and harvested after regular splitting at day 30. Actin was used as loading control.
- f.** Analysis of the cumulative population doublings observed during the culture of two independent batches of MEF<sup>loxp/loxp</sup> x CreER cells maintained as described in figure S2e.

**Figure S3. HDAC4 depletion causes a senescence-like cell cycle arrest.**

- a.** Schematic representation of HDAC4 genomic organization with indicated: the exons (vertical bars), the introns (junctions between the bars) and the PAM sequences utilized for the CRISPR/Cas9 genome editing.
- b.** Genomic sequences of the HDAC4<sup>-/-</sup> BJ/RAS/E1A and SK-LMS-1 cells used in this study.

- c.** Microscopic images of SA- $\beta$ -gal stained SK-LMS-1 clones, as indicated.
- d.** Representative images of MTT stained foci formed from the indicated SK-LMS-1 clones and grown for 15 days in soft-agar.
- e.** Quantification of the stained foci displayed in Fig. S3e. Data are presented as mean  $\pm$  SD; n = 4.
- f.** Histogram representing the percentage of TB positivity in the indicated SK-LMS-1 clones. Mean  $\pm$  SD; n = 3.
- g.** PCA analysis performed on the expression profile of the indicated SK-LMS-1 clones.
- h.** Number of foci generated in soft-agar Analysis by WT or *HDAC4*<sup>-/-</sup> SK-LMS-1 cells expressing *HYGRO*<sup>R</sup> (clone 635) or *HDAC4* (clones 275 and 279). Mean  $\pm$  SD; n = 4. The significance in relative to the KO clone 635.

**Figure S4. Characterization of the role played by HDAC4 in sustaining senescence escape and melanomagenesis.**

**a.** Kaplan-Meier survival analysis related to the expression levels of HDAC4 ( $z\text{-score} > 1.75$ ,  $n=25$ ) in 425 TCGA melanoma samples. Median months overall survival: 47.54 and 81.20 respectively in HDAC4 high and HDAC4 low clusters of patients.

**b.** Immunoblot analysis of HDAC4 and LMNB1 in the indicated A375 clones, re-expressing or not a doxycycline (DOX)-inducible CRISPR/Cas9 resistant form of HDAC4 (*HDAC4<sup>PAM</sup>*). Actin was used as loading control.

**c.** Analysis of the percentage of BrdU positive cells. The significance is relative to WT cells (black \*) or to clones grown in absence of DOX (red \*). Mean  $\pm$  SD;  $n=4$ .

**d.** Analysis of the percentage of SA- $\beta$ -gal positive cells. The significance is relative to WT cells (black \*) or to clones grown in absence of DOX (red \*). Mean  $\pm$  SD;  $n=4$ .

**e.** Analysis of the percentage of cells displaying chromatin cytoplasmic fragments (CCFs). The significance is relative to WT cells (black \*) or to clones grown in absence of DOX (red \*). Mean  $\pm$  SD;  $n=4$ .

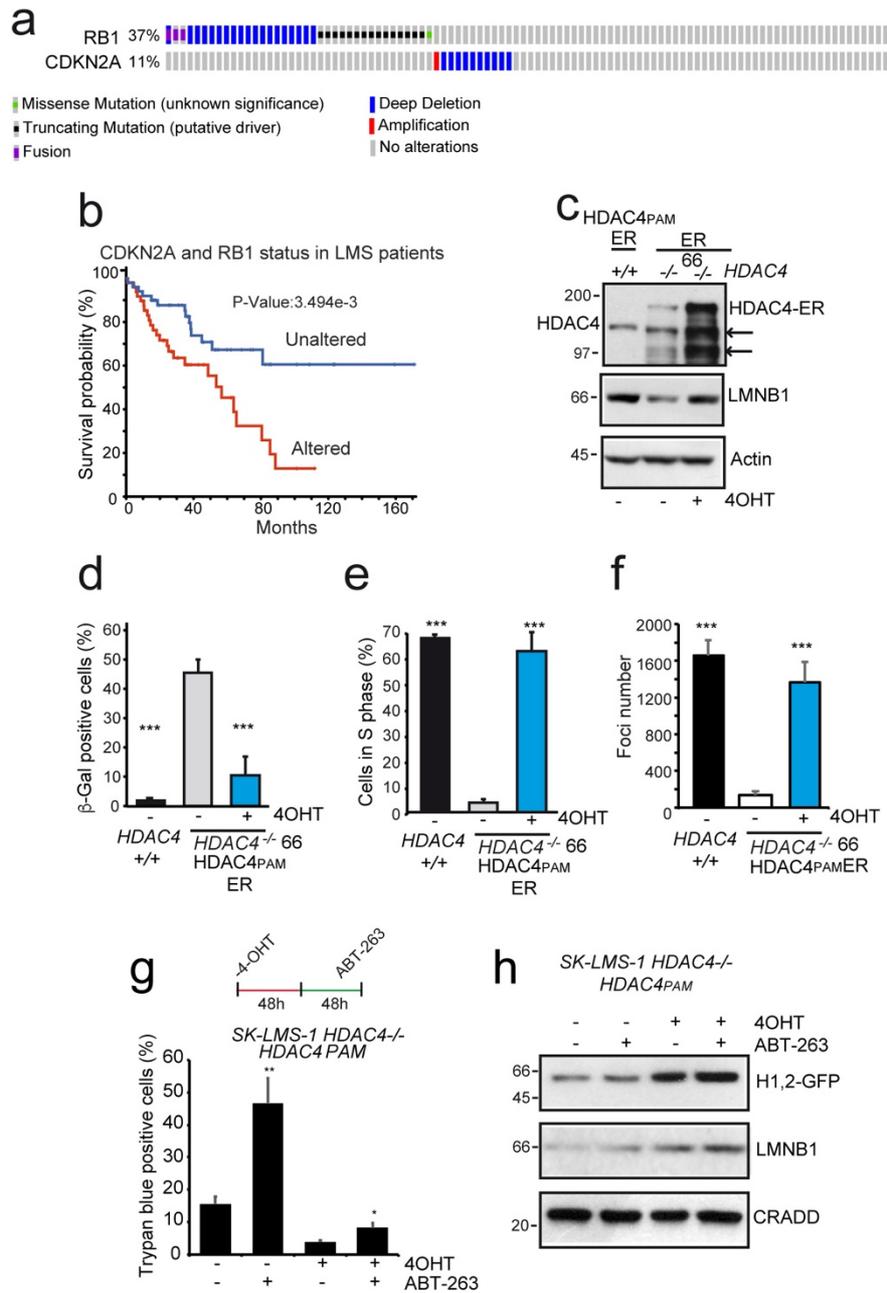

**f.** Analysis of the percentage of cells with down-regulated/absent LMNB1. The significance is relative to WT cells (black \*) or to clones grown in absence of DOX (red \*). Mean  $\pm$  SD;  $n=4$ .

**g.** mRNA expression levels of the indicated genes in the indicated A375 clones, grown for 4 days in the presence or absence of DOX. The significance and cell treatments are as explained in Fig. S4F. Mean  $\pm$  SD;  $n=4$ .

**h.** Immunoblot analysis in WM115 cells silenced or not for HDAC4 (72h), using the indicated antibodies. Actin was used as loading control.

**i.** Analysis of the percentage of SA- $\beta$ -gal positive WM115 cells, after the silencing of HDAC4 for 72 hours. Mean  $\pm$  SD;  $n=3$ .

**j.** mRNA expression levels of the indicated genes in WM115 silenced for HDAC4, in respect to siRNA Control. Mean  $\pm$  SD;  $n=3$ .

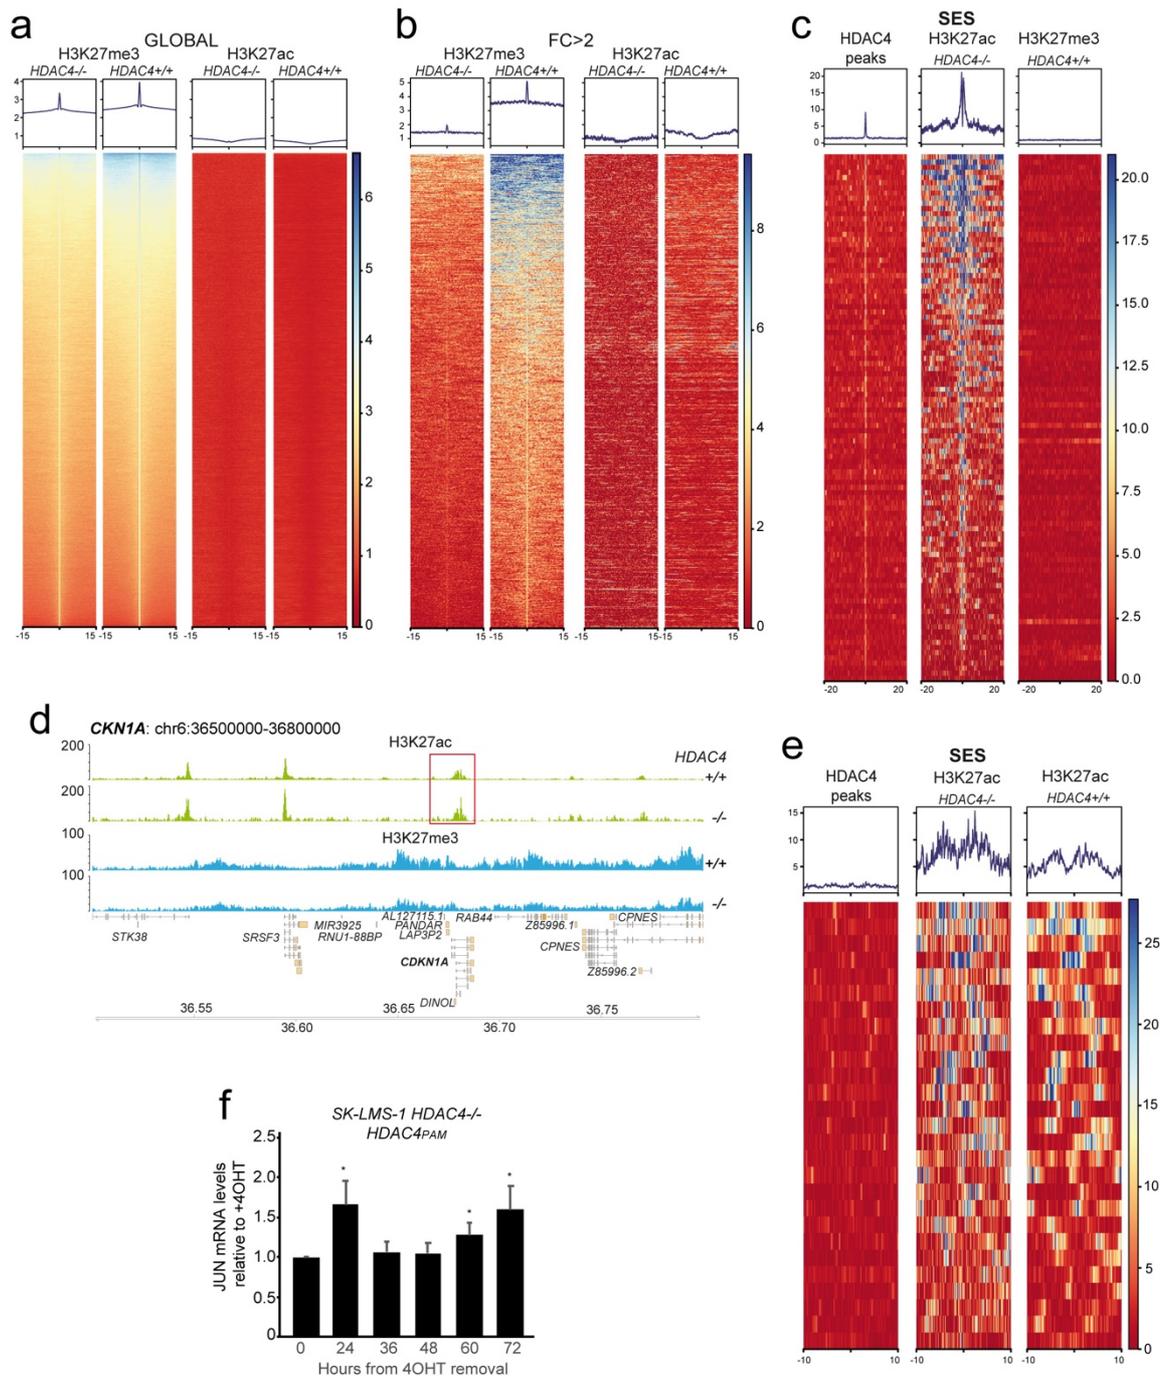

**Figure S5. Characterization of the pro-senescent properties arising from HDAC4 depletion in the established inducible rescue models.**

**a.** Oncoprint of the mutational status of *RB1* and *CDKN2A* in 100 LMS TCGA samples.

**b.** Kaplan-Meier survival analysis related to the mutational status of *RB1* and *CDKN2A* (altered group n=48, unaltered n=52; median months overall survival: 56.61 and >170 respectively in altered and unaltered clusters of patients).

- c.** Immunoblot analysis in SK-LMS-1 WT or *HDAC4*<sup>-/-</sup> (clone 66) cells re-expressing a tamoxifen inducible *HDAC4*<sup>PAM</sup>-ER. Arrowheads point to HDAC4 cleavage products observed in HDAC4-ER expressing cells. Actin was the loading control.
- d.** Analysis of SA-β-gal positive SK-LMS-1 cells *HDAC4*<sup>+/+</sup>, *HDAC4*<sup>-/-</sup> or *HDAC4*<sup>-/-</sup> re-expressing the tamoxifen inducible *HDAC4*<sup>PAM</sup>-ER. Mean ± SD; n=4.
- e.** Analysis of BrdU positive SK-LMS-1 cells *HDAC4*<sup>+/+</sup>, *HDAC4*<sup>-/-</sup> or *HDAC4*<sup>-/-</sup> re-expressing the tamoxifen inducible *HDAC4*<sup>PAM</sup>-ER. Mean ± SD; n=4.
- f.** Analysis of foci formation after growing in soft agar SK-LMS-1 cells *HDAC4*<sup>+/+</sup>, *HDAC4*<sup>-/-</sup> or *HDAC4*<sup>-/-</sup> re-expressing the tamoxifen inducible *HDAC4*<sup>PAM</sup>-ER. Mean ± SD; n=4.
- g.** The senolytic drug ABT-263 was applied to SK-LMS-1 *HDAC4*<sup>-/-</sup> *HDAC4*<sup>PAM</sup>-ER cells as indicated to trigger apoptosis. Trypan blue positive cells are shown. Mean ± SD; n = 3.
- h.** Immunoblot analysis of HDAC4 and H1.2 GFP in the same cells described in Fig. S5h. CRADD was used as loading control.

**Figure S6. HDAC4 supervises enhancers and super-enhancers activated early during senescence.**

**a.** Heat-map of the 139200 H3K27me3 enriched peaks (“GLOBAL”) and of the associated H3K27ac signal in the same regions in the indicated SK-LMS-1 cells. The analysis was performed in a region of  $\pm 15$ Kb around peak summit.

**b.** Heat-map of the 1205 H3K27me3 peaks (“FC>2”) displaying an overall signal ratio (WT/KO)>2 and of the associated H3K27ac signal in the same regions. The analysis was performed in a region of  $\pm 15$ Kb around peak summit.

- c.** Heat-map of the HDAC4 (WT), H3K27ac (KO), and H3K27me3 (WT) signals in the 91 SES containing HDAC4 enriched peaks. The analysis was performed in a region of  $\pm 20$ Kb around peak summit.
- d.** Detailed view of the H3K27ac and H3K27me3 levels in the *CDKN1A* locus in WT and HDAC4 KO SK-LMS-1 cells.
- e.** Heat-map of the HDAC4 (WT), H3K27ac (KO), and H3K27ac (WT) signals in SES of SK-LMS-1 cells containing HDAC4 enriched peaks. The analysis was performed in a region of  $\pm 10$ Kb around peak summit. The ROSE algorithm was used to separate super-enhancers from typical enhancers. SE defined in SK-LMS-1/*HDAC4*<sup>-/-</sup> cells expressing the tamoxifen inducible version of HDAC4 (WT) were subtracted from SE defined in the same cells grown for 36h without 4-OHT. The obtained 363 SE represent the SES of SK-LMS-1 cells. These SES were next selected for the presence of HDAC4 peaks (n=27).
- f.** JUN mRNA expression levels in SK-LMS-1 *HDAC4*<sup>-/-</sup> cells, re-expressing (+4-OHT) or not (-4-OHT) HDAC4<sup>PAM</sup>-ER. The levels are relative to SK-LMS-1 *HDAC4*<sup>-/-</sup>HDAC4<sup>PAM</sup>-ER grown in the presence of 4OHT. Mean  $\pm$  SD; n = 3.
