

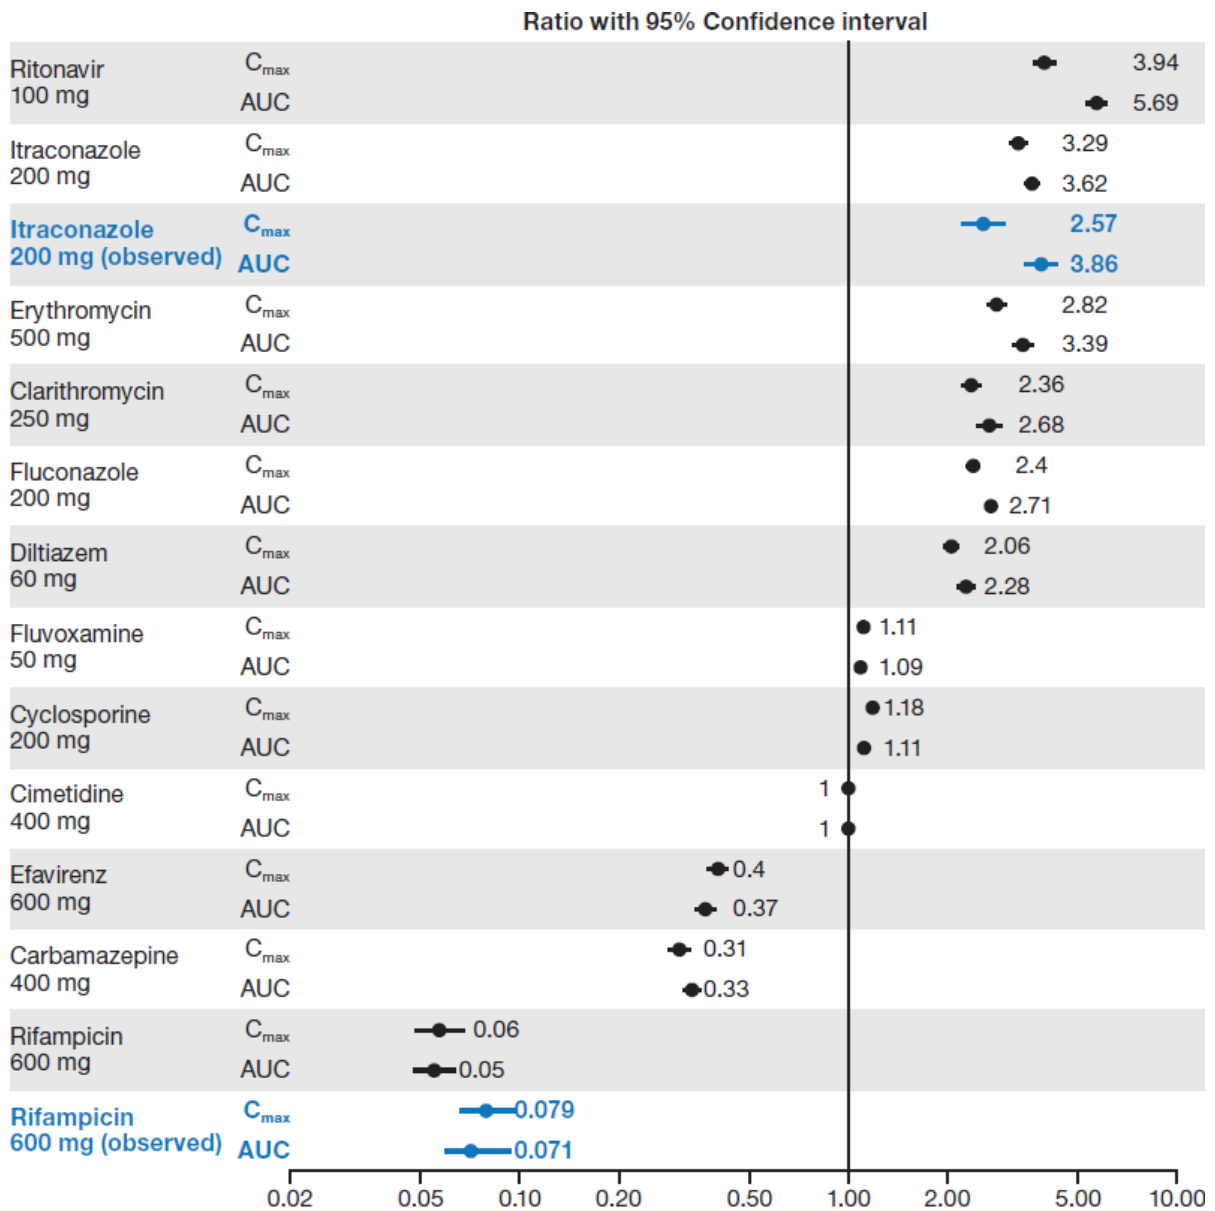

Figure S4. Observed and simulated zanubrutinib geometric mean C_{max} and AUC ratios (95% CI) with various CYP3A4 inhibitors and inducers

Simulation conditions: 10 virtual trials, each trial included 10 subjects (aged 20-50 years and 50% female). Each subject received an inhibitor or inducer for 10 days; Single dose of zanubrutinib 160 mg was administered at Day 10.

Abbreviations: AUC, area under the plasma concentration–time curve; CI, confidence interval; C_{max} , maximum plasma concentration.
