Supplementary Fig. 1. (A) Frequency of symptoms related to SARS-CoV-2 infection in study subjects (n = 83). Each row represents a (type of) clinical symptom(s) and shows the percentage of study subjects who self-reported that symptom(s). **(B,C) Anti-RBD levels of IgM and IgA antibodies.** Line graphs showing IgM and IgA antibody levels in the same subjects as in main **Fig 2B**. **(D) Titers of circulating anti-RBD IgG.** Trajectories of RBD-specific IgG antibody titers corresponding to the OD₄₀₅ data in main **Fig. 1A**. Study subjects and definition of sustainers and decayers as per **Fig. 1B**. **(E) Method for neutralizing titer 50 (NT50) determination.** Representative neutralization curves demonstrating the determination of 50% neutralization (red dotted line) for the calculation of NT50 values presented in main **Fig. 1C** and main **Fig. 2C,D**. Relative infection rates were obtained by dividing the fluorescence readings (derived from fluorescently tagged virus) of the sample-treated wells by the un-treated control wells (infection rates above 100% result from small biological variations in untreated wells, and indicate no neutralization). The light green line corresponds to an uninfected (negative control) sample exhibiting no neutralizing activity. **(F) Correlation between anti-RBD titer and NT50.** Correlation analysis between anti-RBD IgG endpoint titers (x-axis) and neutralizing titers (y-axis) (n = 44). The Spearman's correlation coefficient r and corresponding p value were calculated.

Supplementary Fig. 2. Flow cytometry gating strategy for B cell subsets. (A)

Physical parameters. **(B)** Exclusion of dead cells and non-B cells (CD14⁺, CD3⁺, CD4⁺,

CD56⁺). **(C)** CD19⁺CD20⁺ cells (B cells) were further gated to distinguish **(D)** RBD-

specific B cells utilizing fluorescently labeled RBD tetramers. **(E)** Plasmablast

(CD27⁺CD38^{hi}) and non plasmablasts. **(F)** Non-plasmablasts were further gated on

CD27 and IgD for memory phenotyping: Naïve B cells (CD27⁻IgD⁺), Non switched

memory B cells (NSM; CD27⁺IgD⁺), Switched memory B cells (SM; CD27⁺IgD⁻), and

Double negative memory B cell (DNM; CD27⁻IgD⁻). Switched memory (SM) cell were

further gated to determine the frequencies of **(G)** IgG⁺ switched memory B cell (IgG⁺SM)

and **(H)** and IgM⁺ switched memory B cell (IgM⁺SM).
