Supplementary Figure 1. PhenoGraphs of normal and diseased tonsils reveal the heterogeneity of markers distribution.

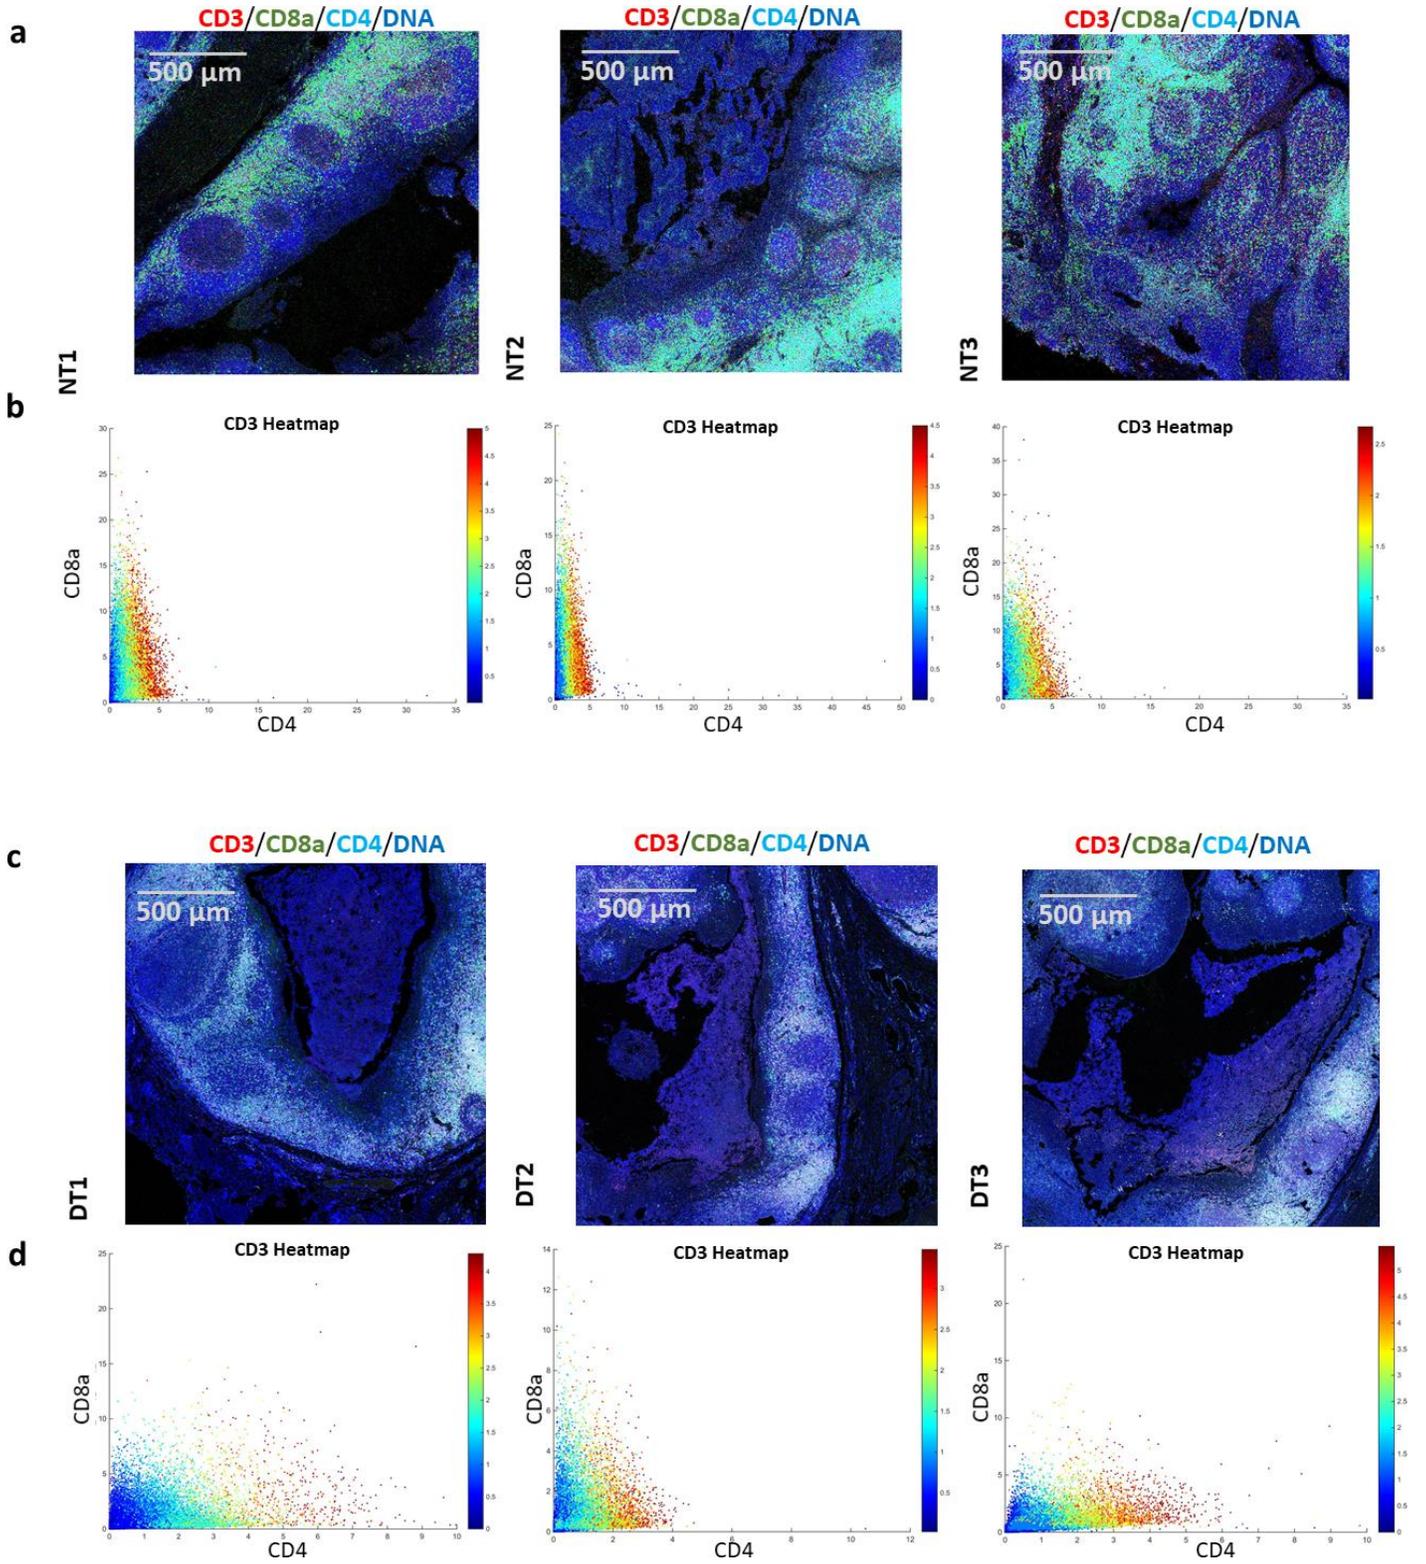

a PhenoGraphs of all three normal ROIs showed all clusters' distribution and associated heatmaps that exhibited marker expressions in each cluster.

b PhenoGraphs of all three diseased ROIs demonstrated the distribution of all clusters and their related heatmaps that showed the marker expressions in each cluster.

Supplementary Figure 2. CD68+ cells are associated with Granzyme B expression in response to infection in the diseased tonsil.

- a** Visual representation showed the co-expression of granzyme B and CD68 across three normal tonsils ROIs.
- b** Correlation analysis between granzyme B and CD68 at the single-cell level across three normal tonsils ROIs was presented. Pearson's correlation coefficient was found to be $R = 0.20265$ for NT1, $R = 0.24448$ for NT2, and 0.19128 for NT3.
- c** Visual representation demonstrated the co-expression of granzyme B and CD68 across three diseased tonsils ROIs.
- d** Correlation analysis between granzyme B and CD68 at the single-cell level across three diseased tonsils ROIs was shown. Pearson's correlation coefficient was found to be $R = 0.34122$ for DT1, $R = 0.57199$ for DT2, and 0.64417 for DT3.

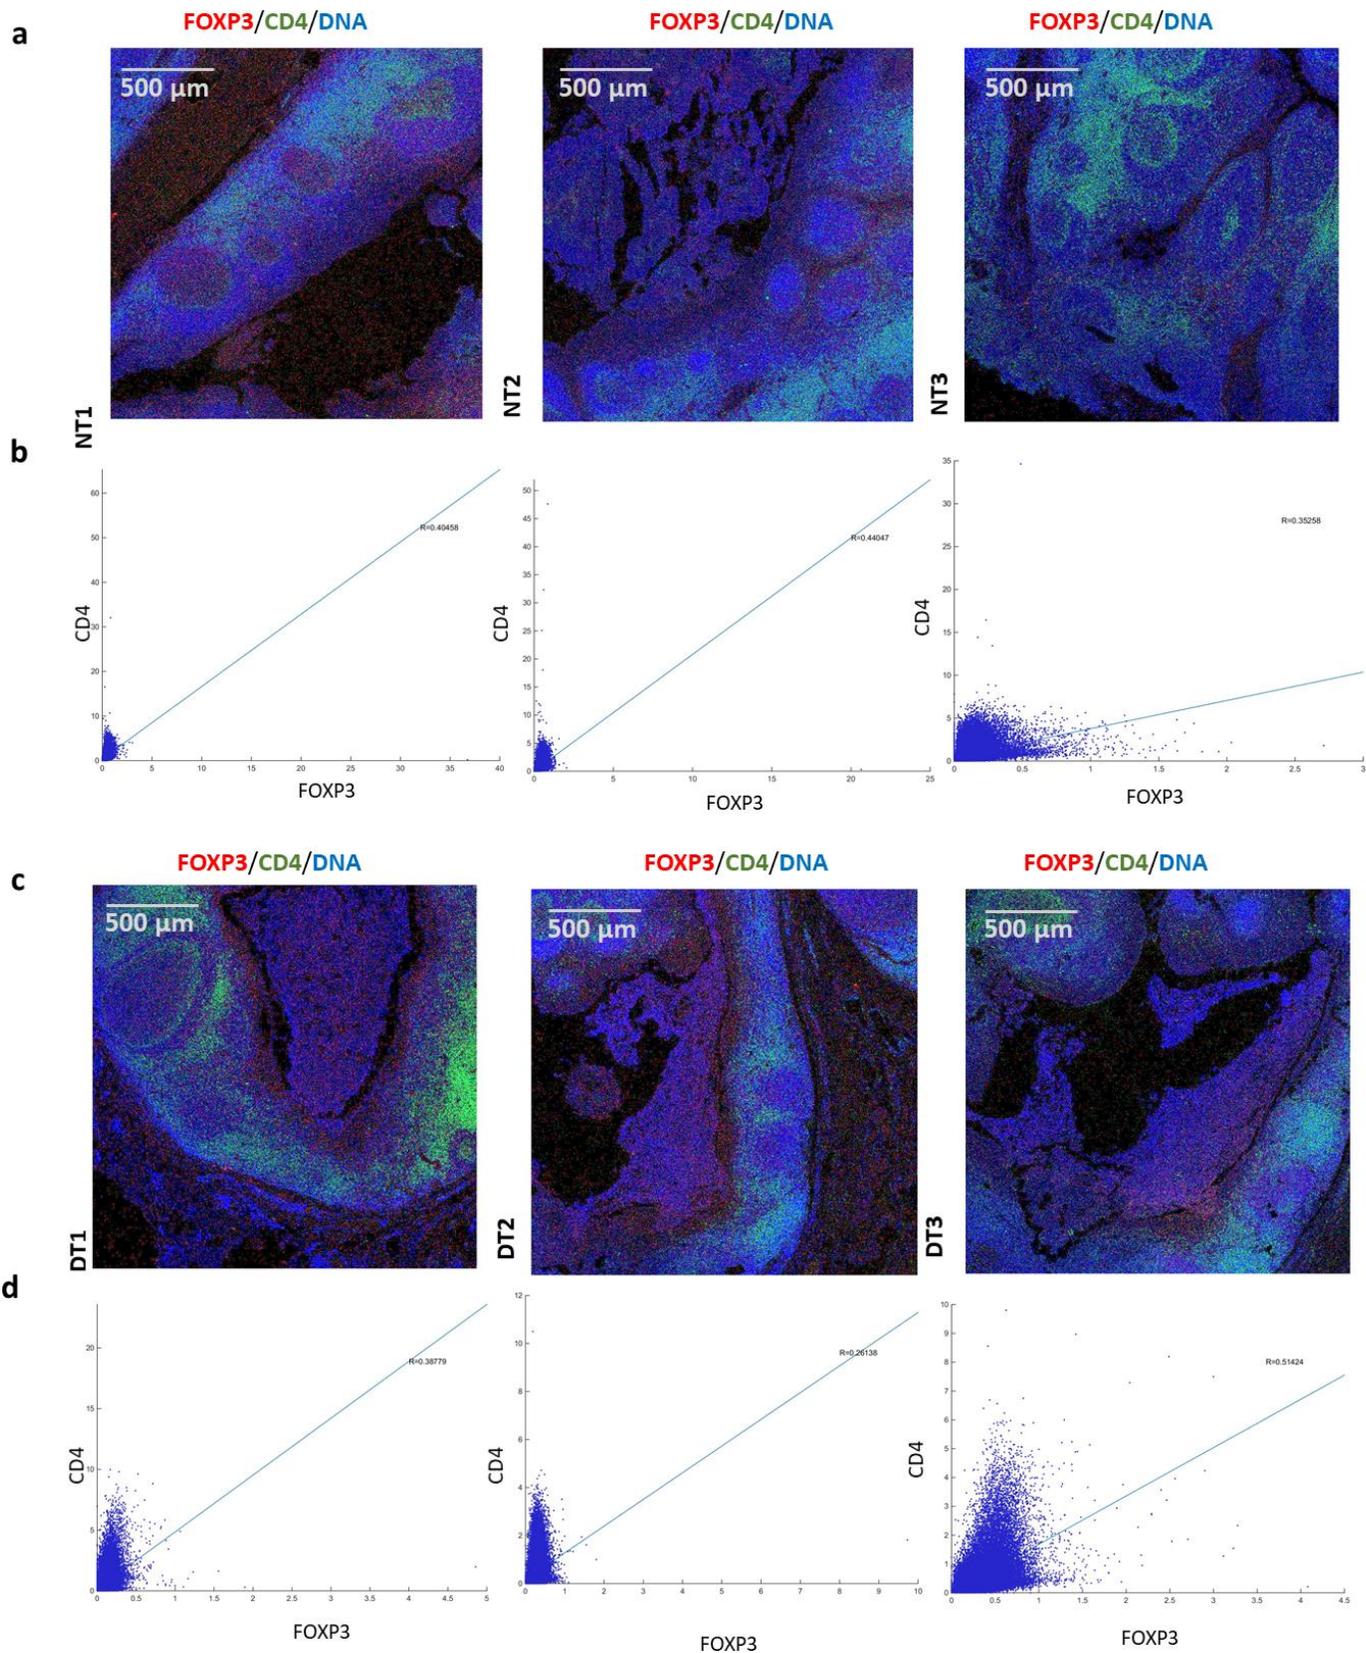

Supplementary Figure 3. CD3+ cells preferentially co-express CD4 in response to infection

a Visual representation showed the co-expression of CD3, CD4, CD8a across three normal tonsils ROIs.

b Correlation analysis between CD4 and CD8a with CD3 heatmap across three normal tonsils ROIs was demonstrated.

c Visual representation provided the co-expression of CD3, CD4, CD8a across three diseased tonsils ROIs.

d Correlation analysis between CD4 and CD8a with CD3 heatmap across three diseased tonsils ROIs was provided.

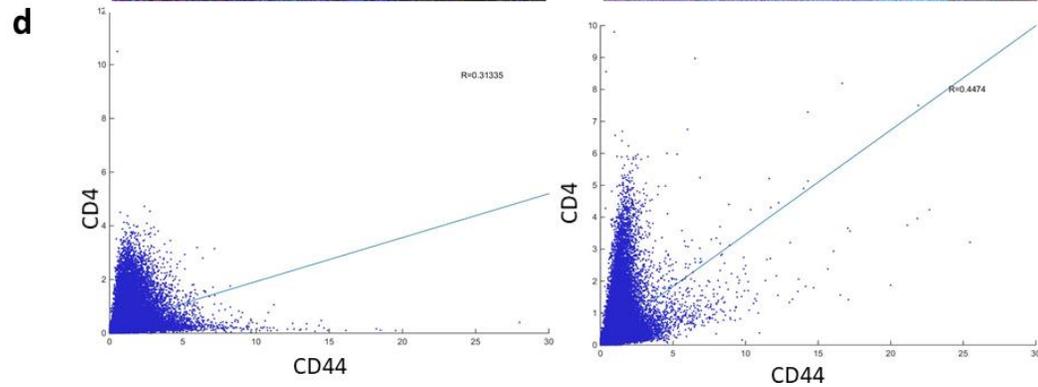

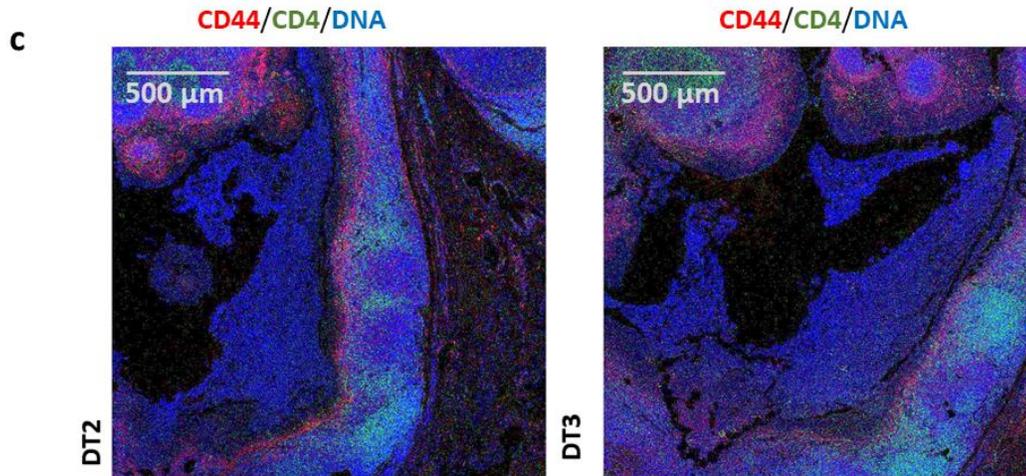

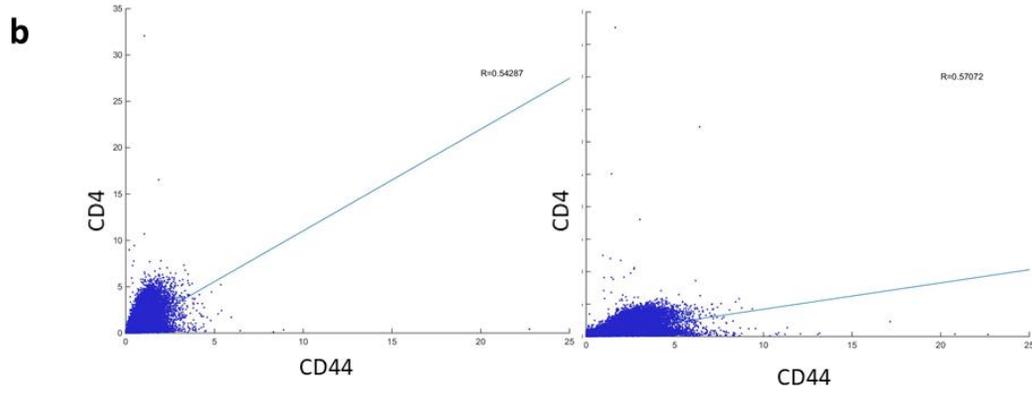

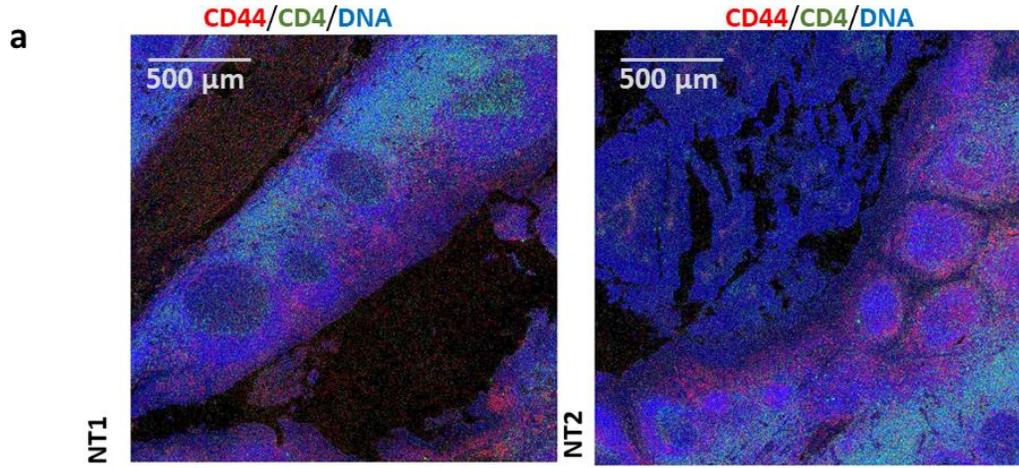

Supplementary Figure 4. FOXP3+ cells Treg cells are a subset of CD4+ cells

a Visual representation demonstrated the co-expression of CD4 and FOXP3 in all three normal ROIs.

b Correlation analysis between CD4 and FOXP3 in all three normal ROIs was shown. Pearson's correlation coefficient was found to be $R = 0.40458$ for NT1, $R = 0.44047$ for NT2, and $R = 0.35258$ for NT3.

c Visual representation showed the co-expression of CD4 and FOXP3 in all three diseased ROIs

d Correlation analysis between CD4 and FOXP3 in all three diseased ROIs was presented. Pearson's correlation coefficient was found to be $R = 0.38779$ for DT1, $R = 0.20138$ for DT2, and $R = 0.51424$ for DT3.

Supplementary Figure 5. CD44+ cells Treg cells are a subset of CD4+ cells

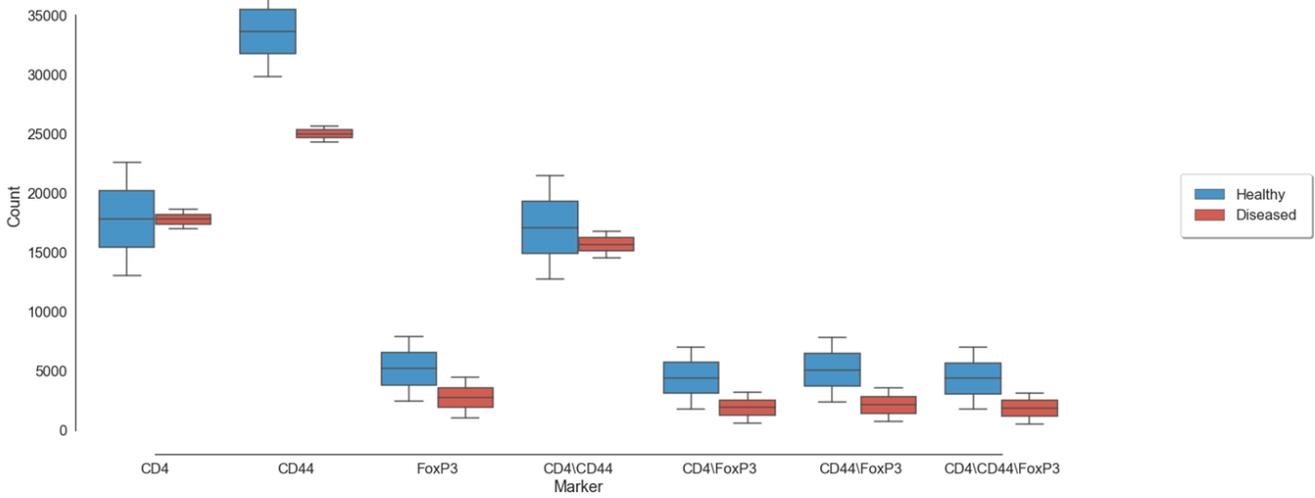

a Visual representation demonstrated the co-expression of CD4 and CD44 in all three normal ROIs.

b Correlation analysis between CD4 and CD44 in all three normal ROIs was presented. Pearson's correlation coefficient was found to be $R = 0.54287$ for NT1, and $R = 0.57072$ for NT2.

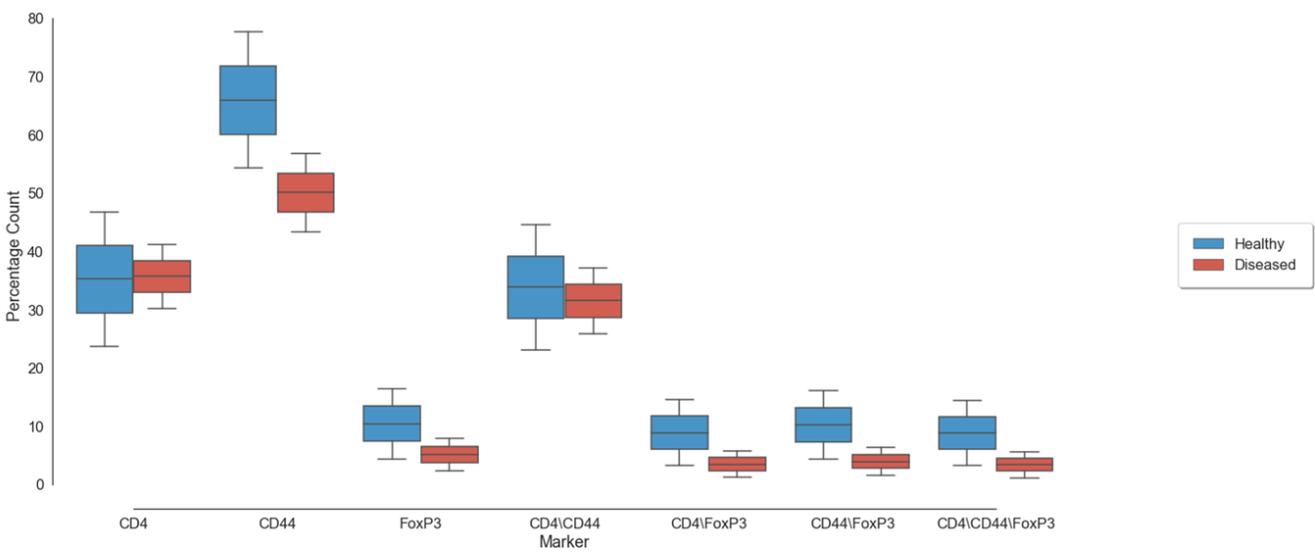

c Visual representation indicated the co-expression of CD4 and CD44 in all three diseased ROIs.

d Correlation analysis between CD4 and CD44 in all three diseased ROIs was shown. Pearson's correlation coefficient was found to be $R = 0.31335$ for DT2, and $R = 0.4474$ for DT3.

a

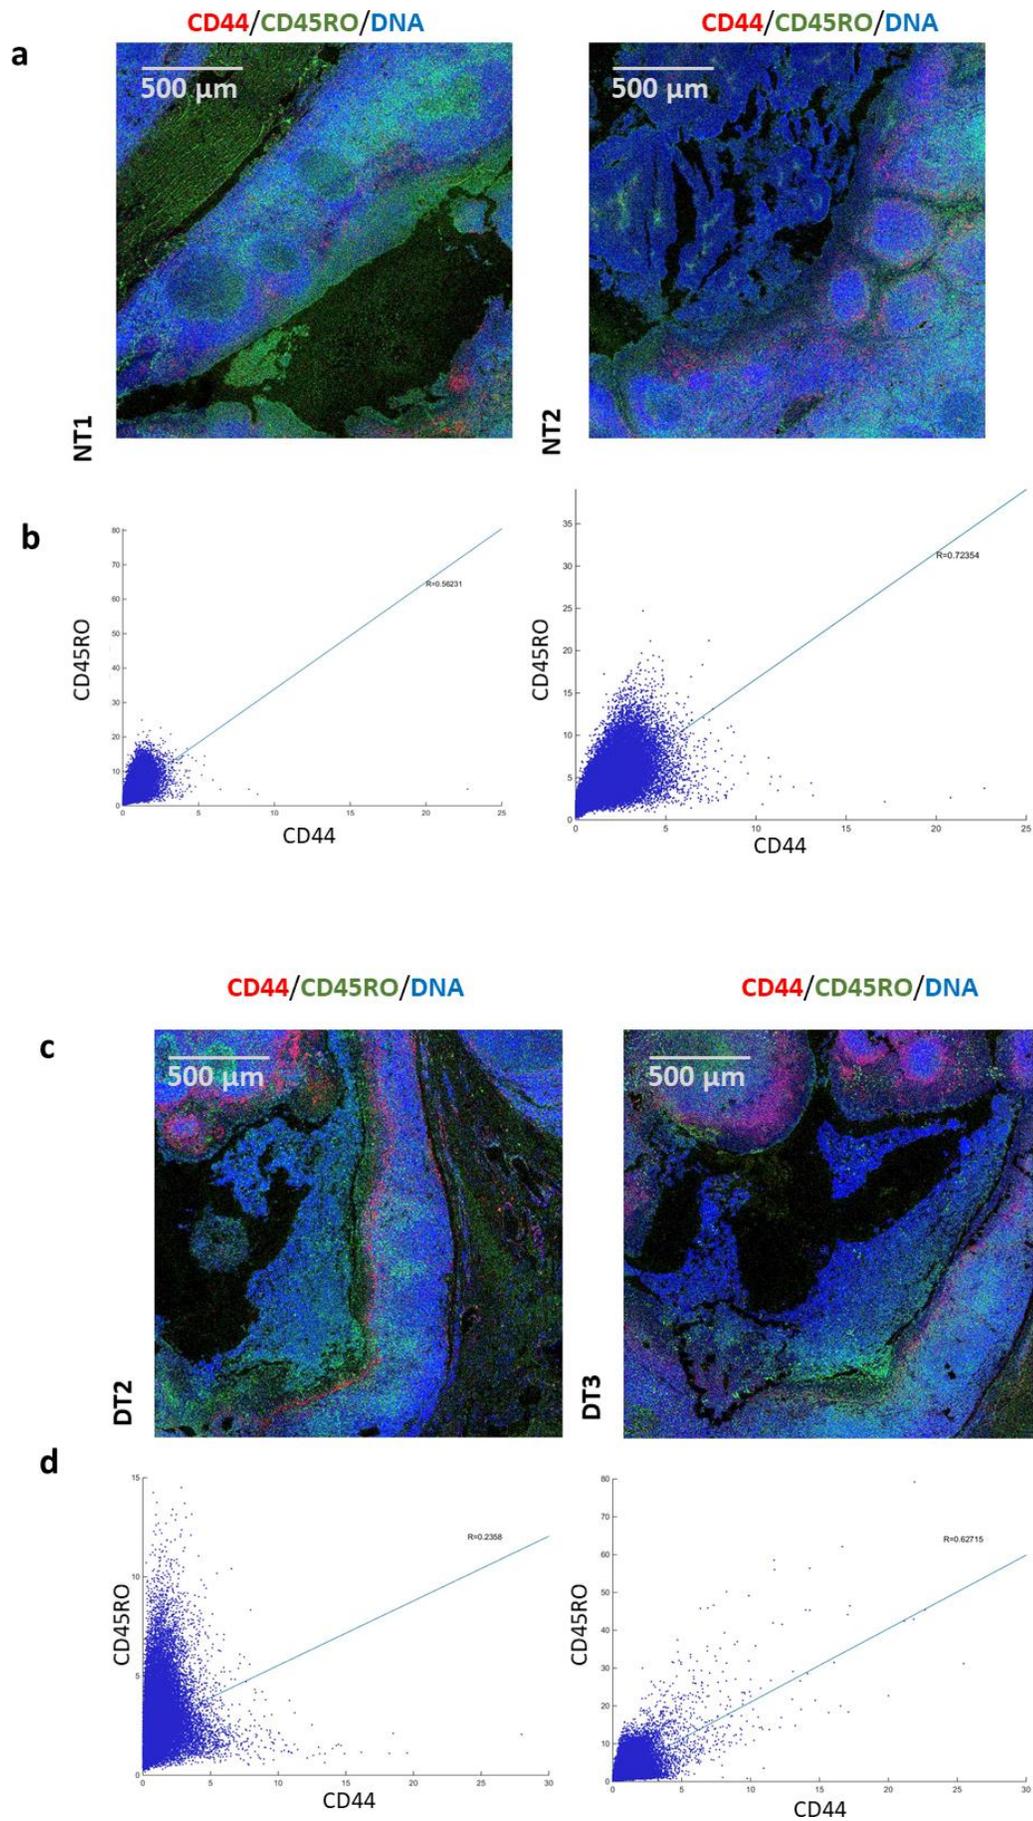

b

Supplementary Figure 6. Treg cells were more active in the normal tonsil compared to diseased tonsil

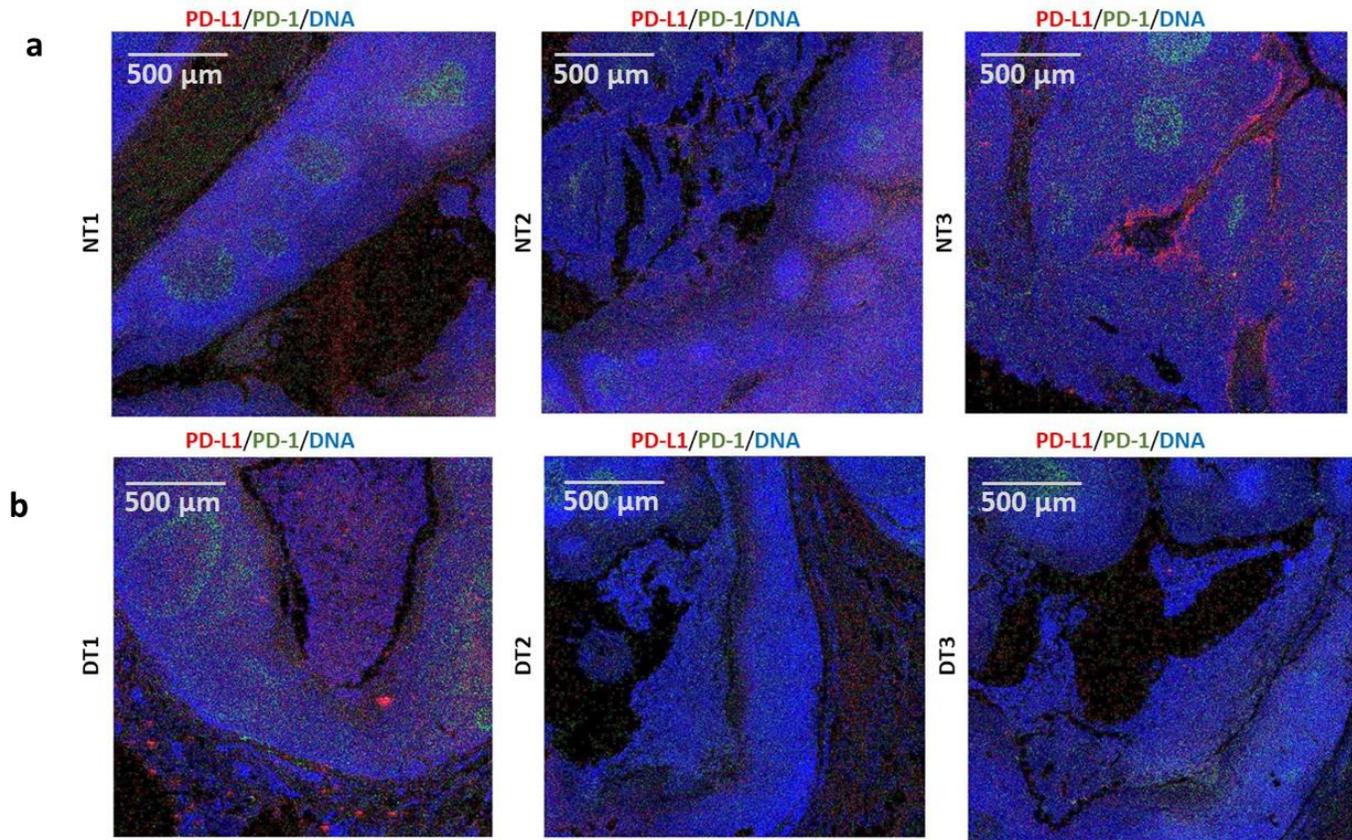

a Box plot quantified the count of cells with positive staining with either CD4, FoxP3, CD44 alone, or different combinations to account for different regulatory T-cell phenotypes. Box plots show median first and third quartile, minimum and maximum (excluding outliers).

b Box plot indicated the percentage of cells in the ROIs with positive staining with either CD4, FoxP3, CD44 alone, or various combinations to account for different regulatory T-cell phenotypes. Box plots show median first and third quartile, minimum and maximum (excluding outliers).

Supplementary Figure 7. Treg cells exhibited a memory phenotype.

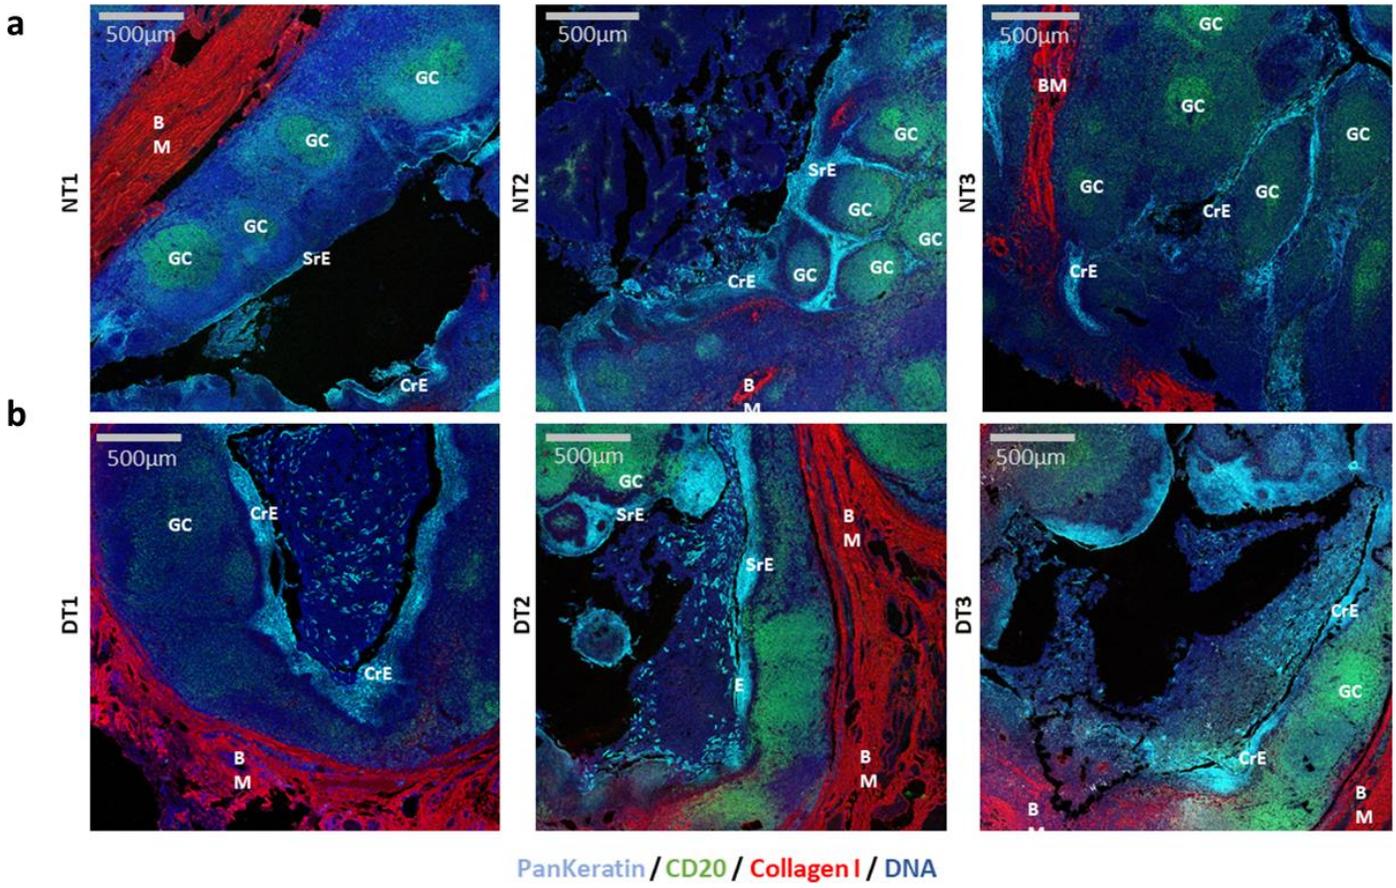

- a** Visual representation showed the co-expression of CD44 and CD45RO across 3 ROIs of the normal tonsil.
- b** Correlation analysis between CD44 and CD45RO across 3 ROIs of the normal tonsil was presented. Pearson's correlation coefficient was found to be $R = 0.56231$ for NT1, and $R = 0.72354$ for NT2.
- c** Visual representation demonstrated the co-expression of CD44 and CD45RO across 3 ROIs of the diseased tonsil.
- d** Correlation analysis between CD44 and CD45RO across 3 ROIs of the diseased tonsil was shown. Pearson's correlation coefficient was found to be $R = 0.2358$ for DT2, and $R = 0.62715$ for DT3.

Supplementary Figure 8. PD-1 expressions were co-localized in the germinal centers

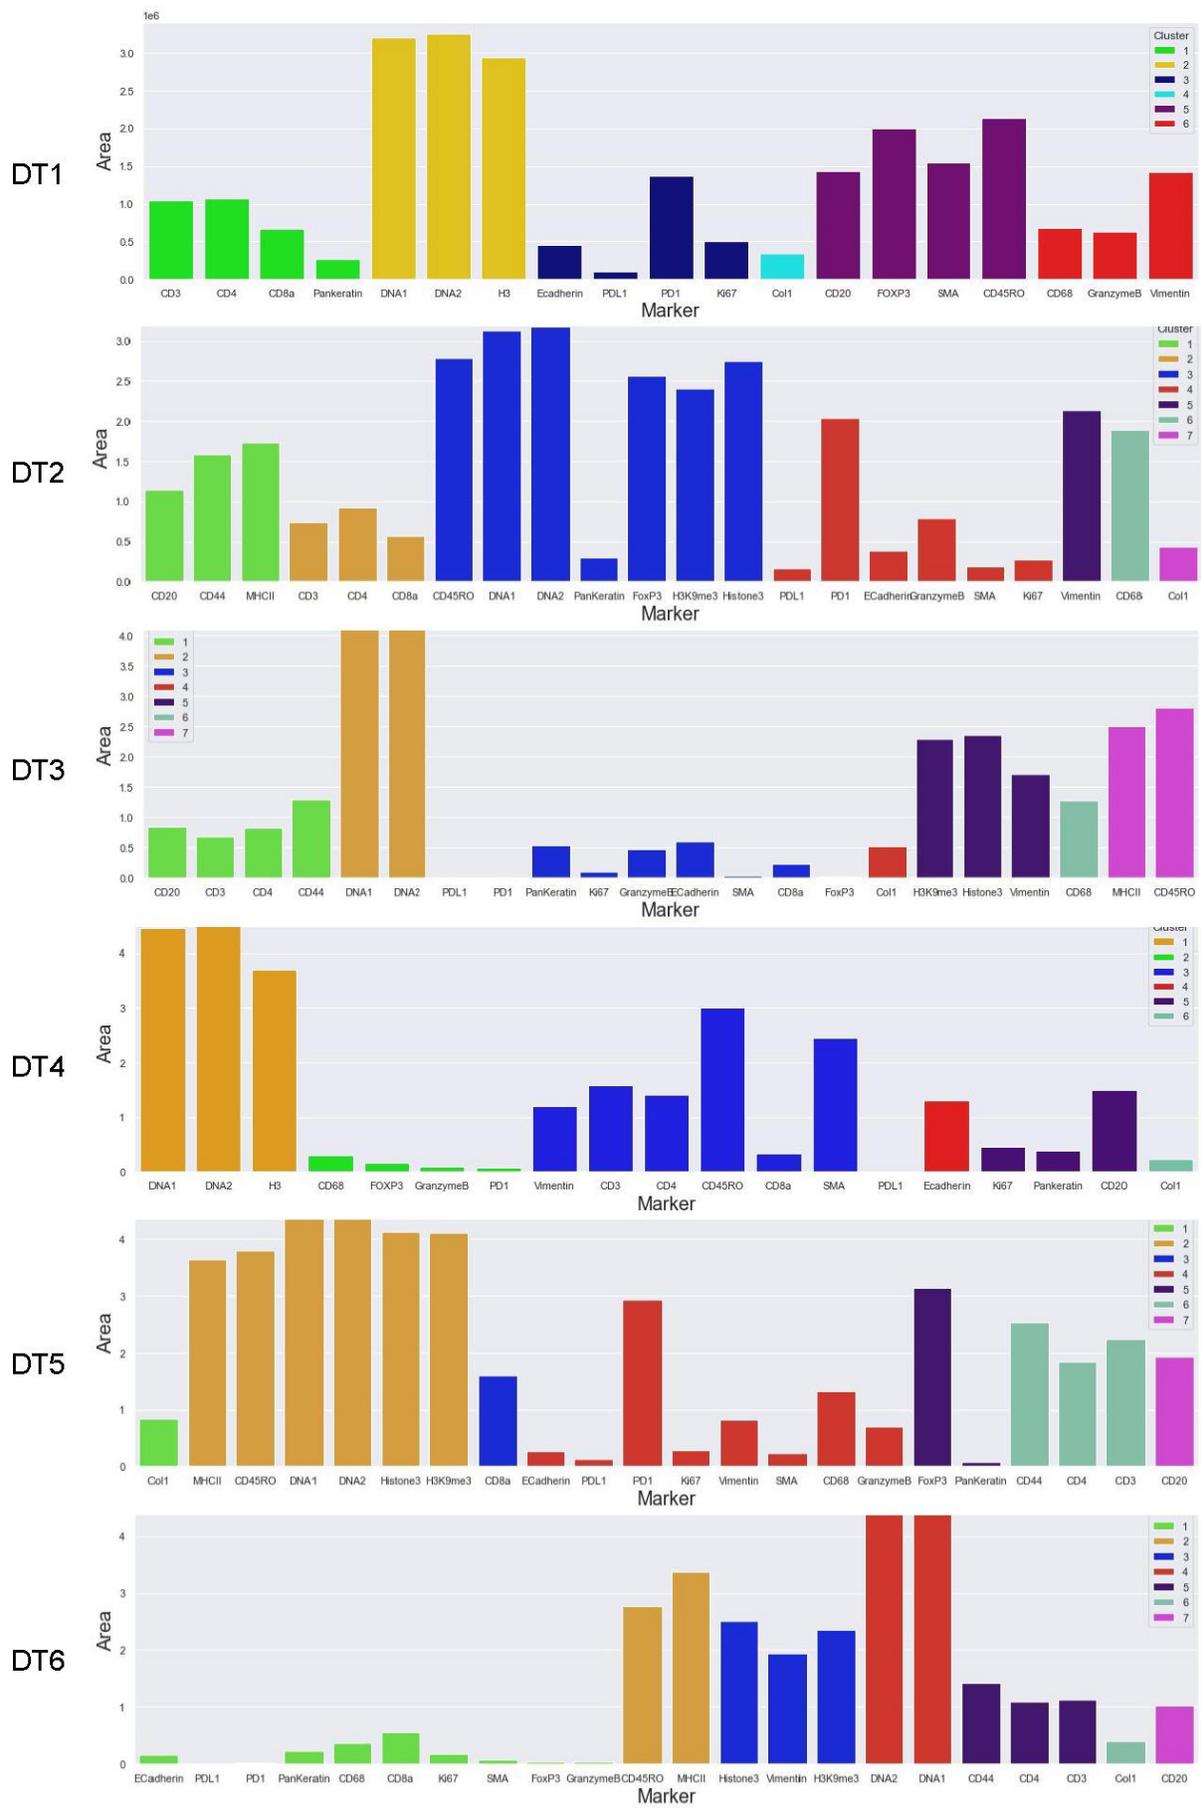

a Visual representation presented the co-expression of PD-1 and PD-L1 in all normal ROIs.

b Visual representation demonstrated the co-expression of PD-1 and PD-L1 in all diseased ROIs.

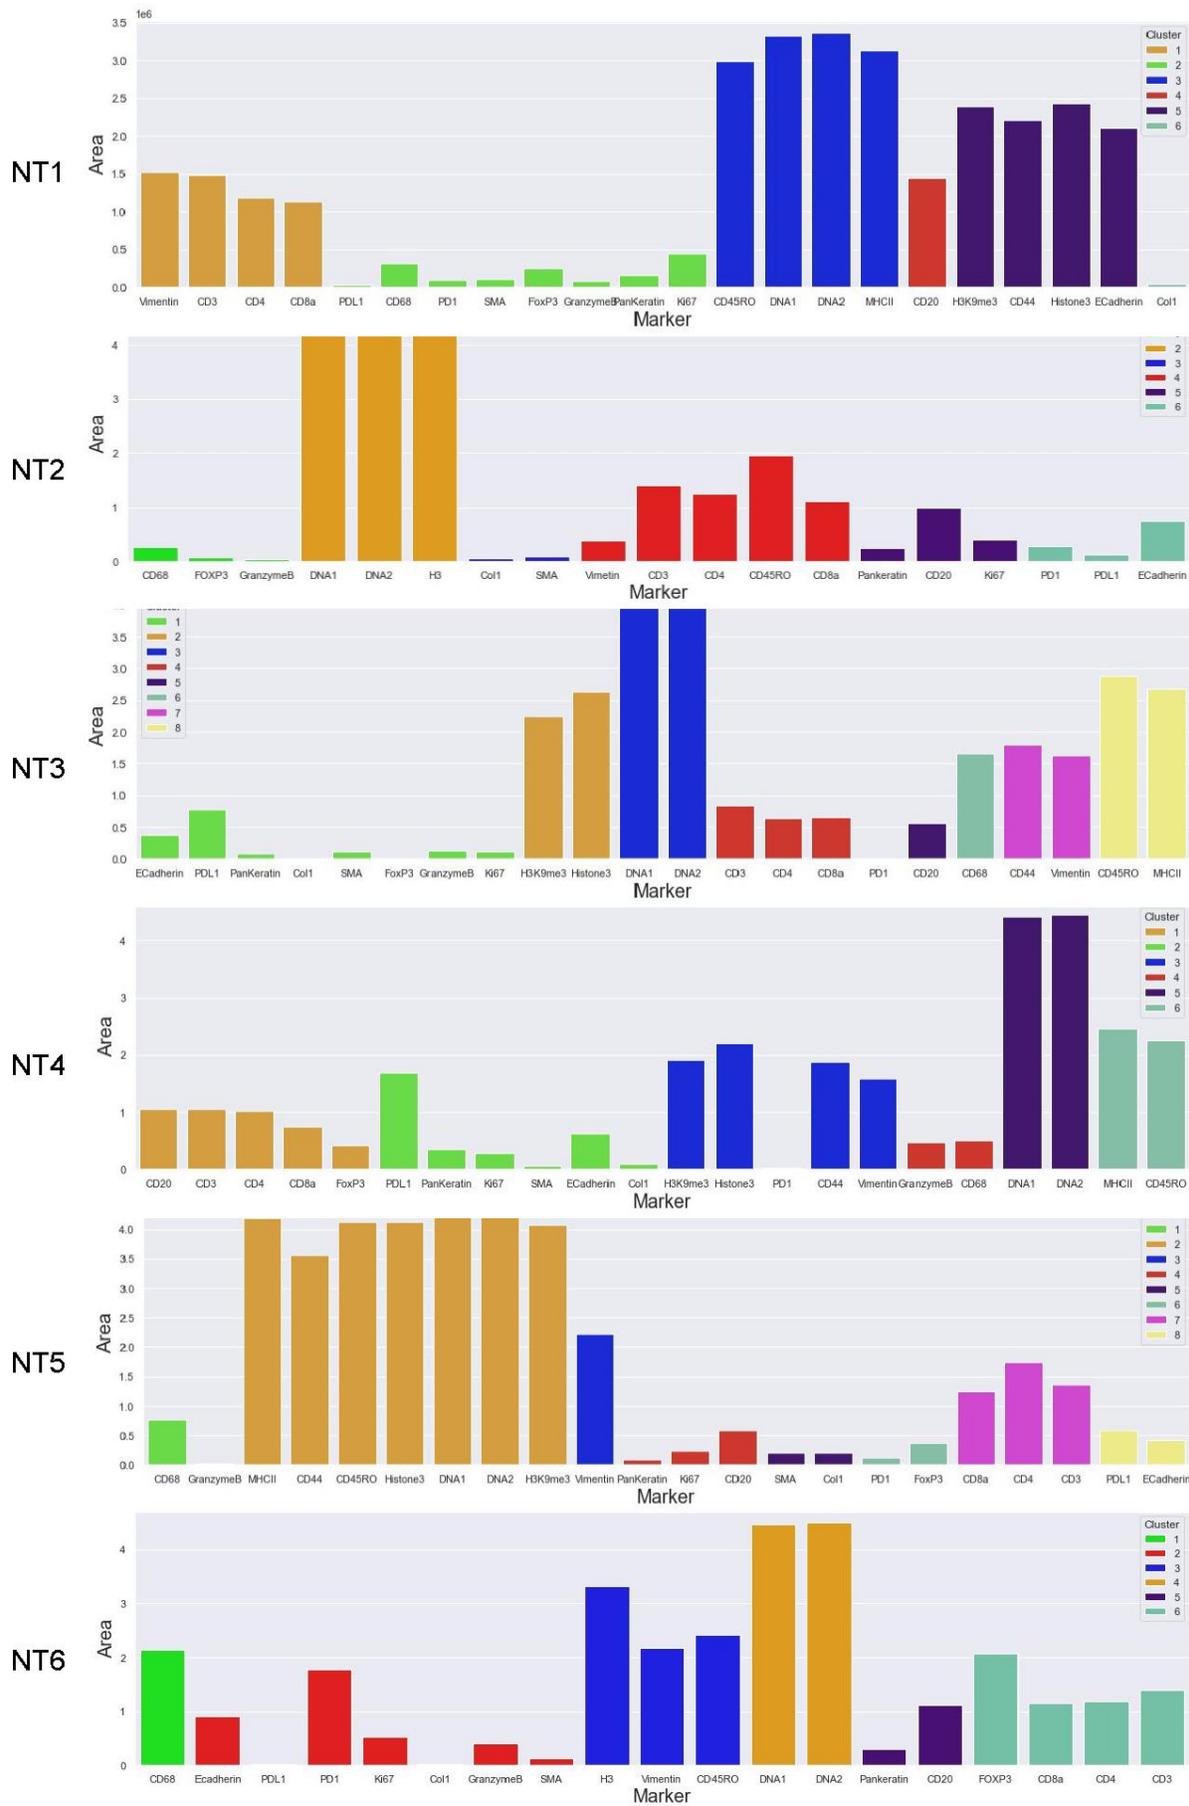

Supplementary Figure 9. Representative figures of normal and diseased tonsil tissues showed distinct anatomical regions.

a Representative composite of all regions of interest (ROIs) chosen for analysis in the normal and (b) diseased conditions was shown. BM (Basement membrane), GC (Germinal Center), and E (Epithelial cells) were denoted on each image. The continuous expression of collagen type 1 (shown in red) was used to identify the basement membrane, whereas PanKeratin (shown in cyan) was utilized to determine the epithelial cell layer. CD20 (shown in green) was used to identify the germinal center where B cells resided. The epithelial layer was further divided into SrE (stromal Epithelium) or (CrE) Crypt Epithelium, depending on the epithelial layer's continuity.

Supplementary Figure 10. Area ratio for markers in three tissues from the diseased tonsil.

Bar plots showed the area in the number of pixels of each marker in disease tonsil datasets. The color corresponding to the anatomical clustering results. DNA1, DNA2, and Histone 3 markers exhibited the highest area compared to other markers. Granzyme B's area coverage was higher in the first three datasets but relatively low compared to the last three.

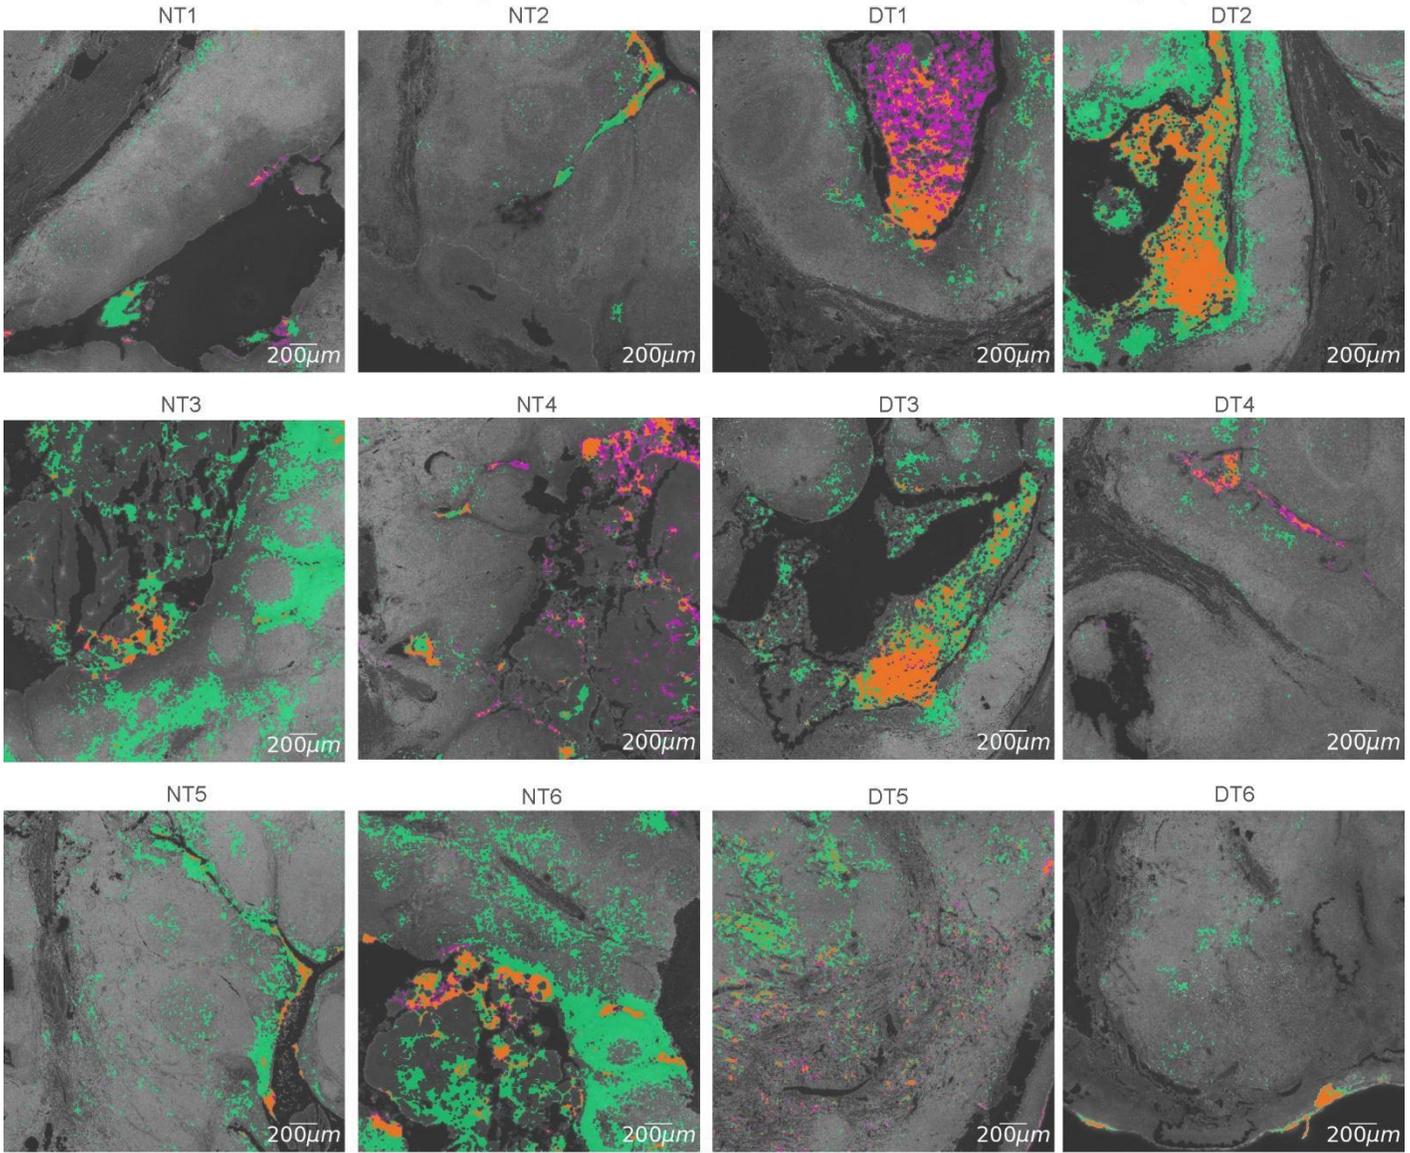

Supplementary Figure 11. Area ratio for markers in three tissues from the healthy tonsil.

Bar plots demonstrated the area in the number of pixels of each marker in normal tonsil datasets. The color corresponds to the anatomical clustering results. DNA1, DNA2, and Histone3 markers showed the highest area compared to other markers. The Granzyme B covered a small area in the images across all the datasets.

Disease Tonsil (DT)

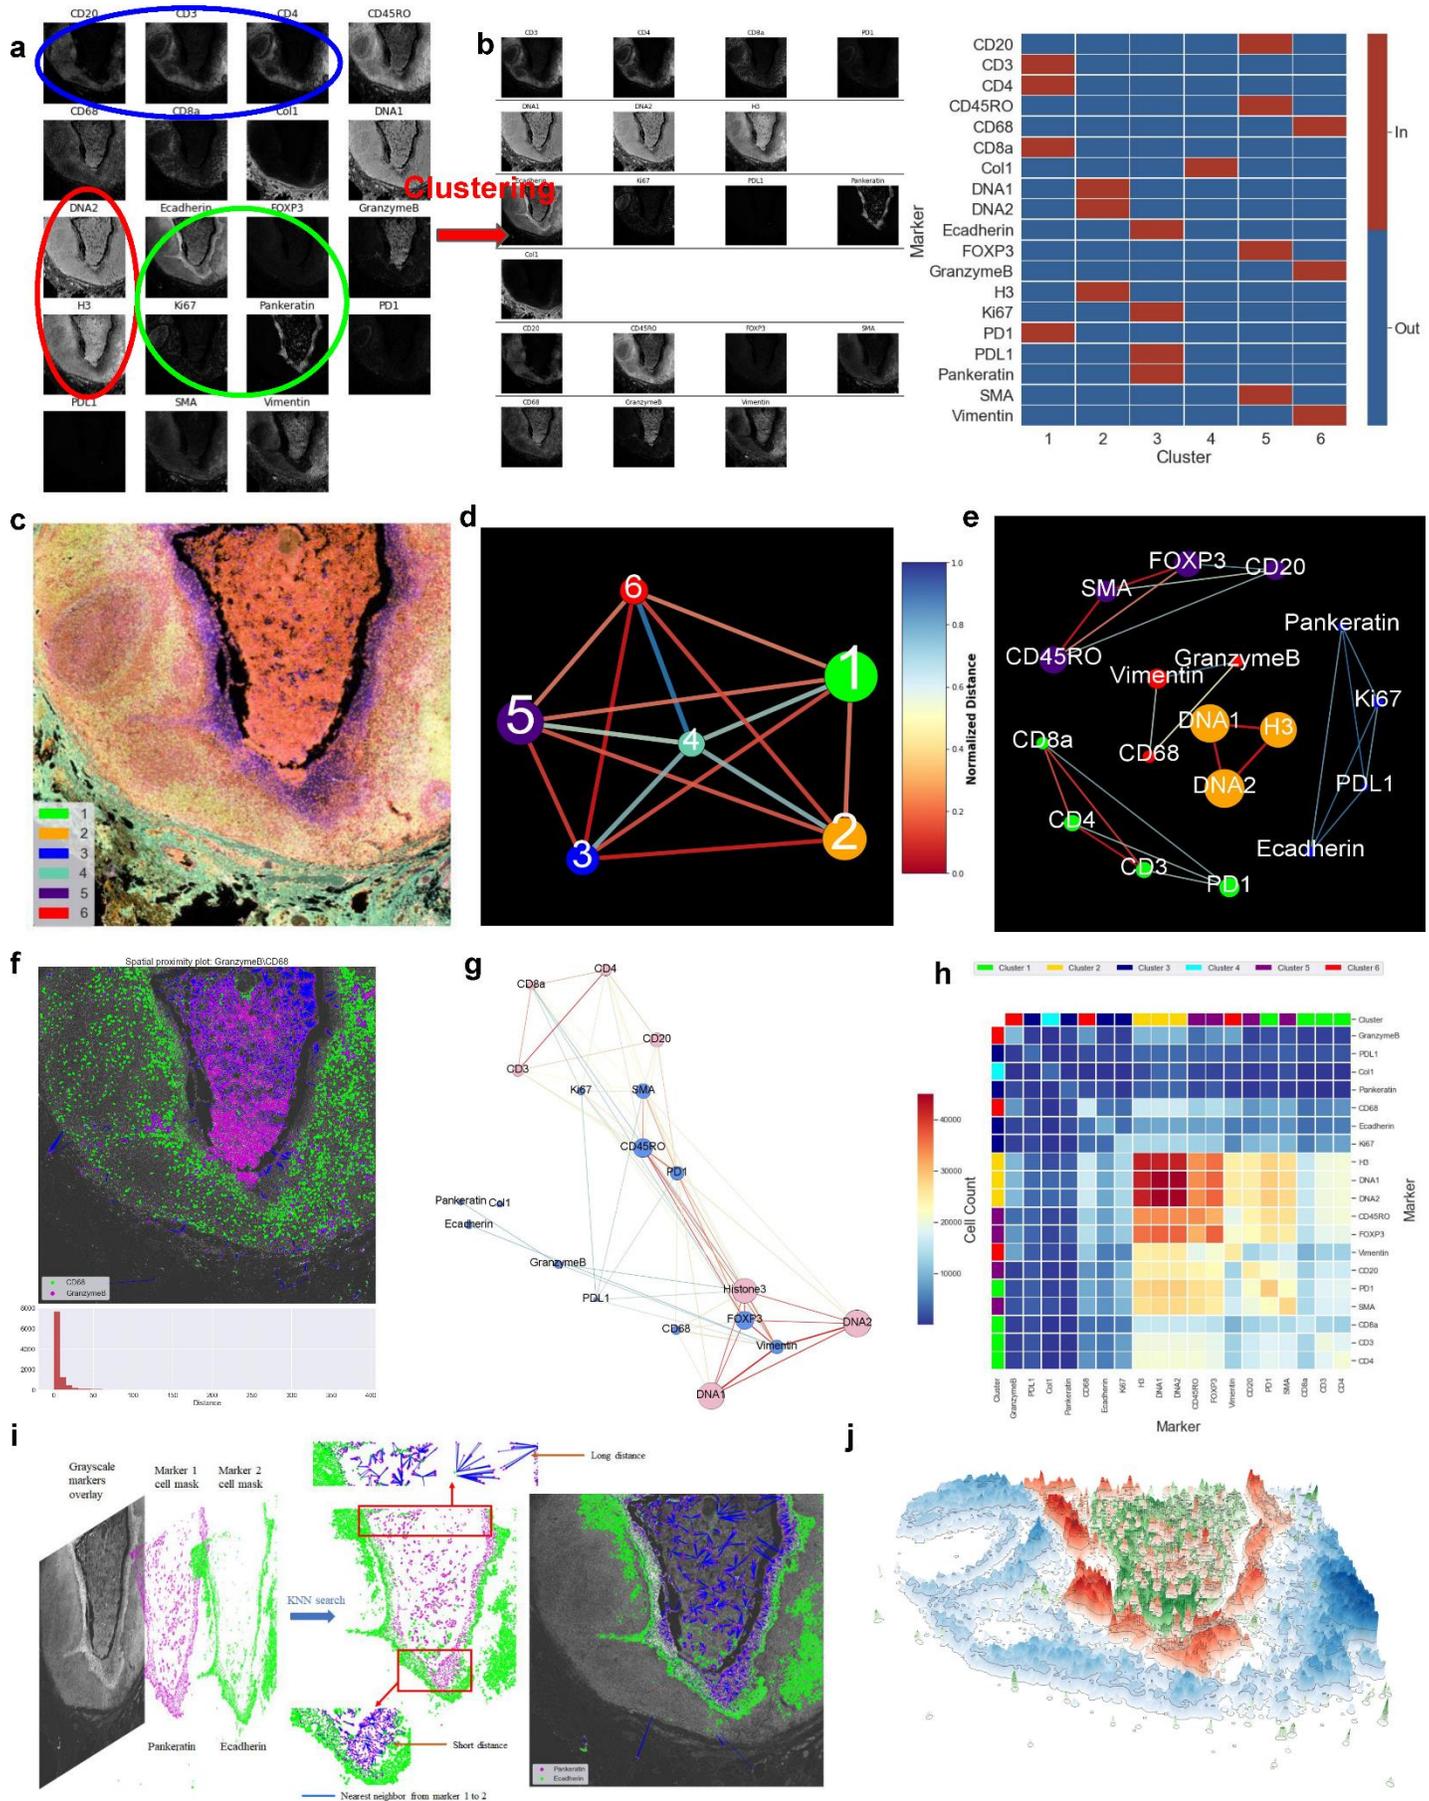

CD68

Granzyme B

Granzyme B and CD68

Supplementary Figure 12. Granzyme B and CD68 marker co-expression region in disease and healthy datasets.

Area representation of Granzyme B and CD68 markers in all tonsil datasets was shown. Granzyme B positive areas in green and CD68 marker regions were represented in magenta. The co-expression of the two markers was denoted in orange. The scale bar is 200 μm

Supplementary Figure 13. SpatialViz single-cell pathology of highly multiplexed protein maps in tonsils.

a Original multiplex images showed marker-specific expression level before clustering.

b Anatomical clustering from marker expression level was presented.

c Clustering anatomic visual by assigning a unique color to each cluster mean image was demonstrated.

d Inter-cluster distance network based on clustering result was displayed.

e Intra-cluster marker distance network based on clustering results was shown.

f Spatial proximity plot of Granzyme B and CD68 markers presented the co-expression and proximity.

g Landmark reference plot was displayed.

h Marker co-expression by cell count for all markers was shown.

i A schema showed the spatial proximity plot generation process.

j Topography plots of CD44, Granzyme B, and Pankeratin markers were displayed.

Supplementary Figure 15. Heatmaps of pairwise distances of markers in tissues from diseased tonsil.

Heatmaps represented the k-NN distance of cells between the pairs of markers in the diseased tonsil. The diagonal is the k-NN distance of the cells within a single marker that showed the marker expression's spread and density. The relative distances were normalized across the images. High overlapping regions such as DNA1, DNA2, and Histone 3 both exhibited short distances within the cells of the same marker and pair of markers.

Supplementary Figure 16. Heatmaps of pairwise distances of markers in tissues from the healthy tonsil.

Heatmap showed the k-NN distances of cells between the pairs of markers in the healthy tonsil. The diagonal was the k-NN distance of cells within a single marker that demonstrated the marker expressions' spread and density. The relative distance was normalized across the images. High overlapping regions such as DNA 1, DNA 2, and Histone 3 both showed short distances within the cells of the same marker and pair of markers.

Supplementary Figure 17. Spatial proximity maps of cell-pairs within a k-neighbor distance (k-NN) in healthy and disease tonsils.

a Different spatial proximity map of cell pairs within nearest neighbor distance in healthy tonsil were shown. The scale bar is 200 μm

b Spatial proximity maps of cell pairs within the closest neighbor distance in healthy tonsils were demonstrated.

Magenta and green color represented individual cells in the pair of markers.

The presented plots corresponded to the Granzyme B/CD68 and Pankeratin/E-Cadherin pairs of the last three datasets of both diseased and healthy tonsils. The scale bar is 200 μm .

Supplementary Figure 18. Spatial proximity maps of cell pairs within a k-neighbor distance (k-NN) in healthy and disease tonsils for T cell marker pairs.

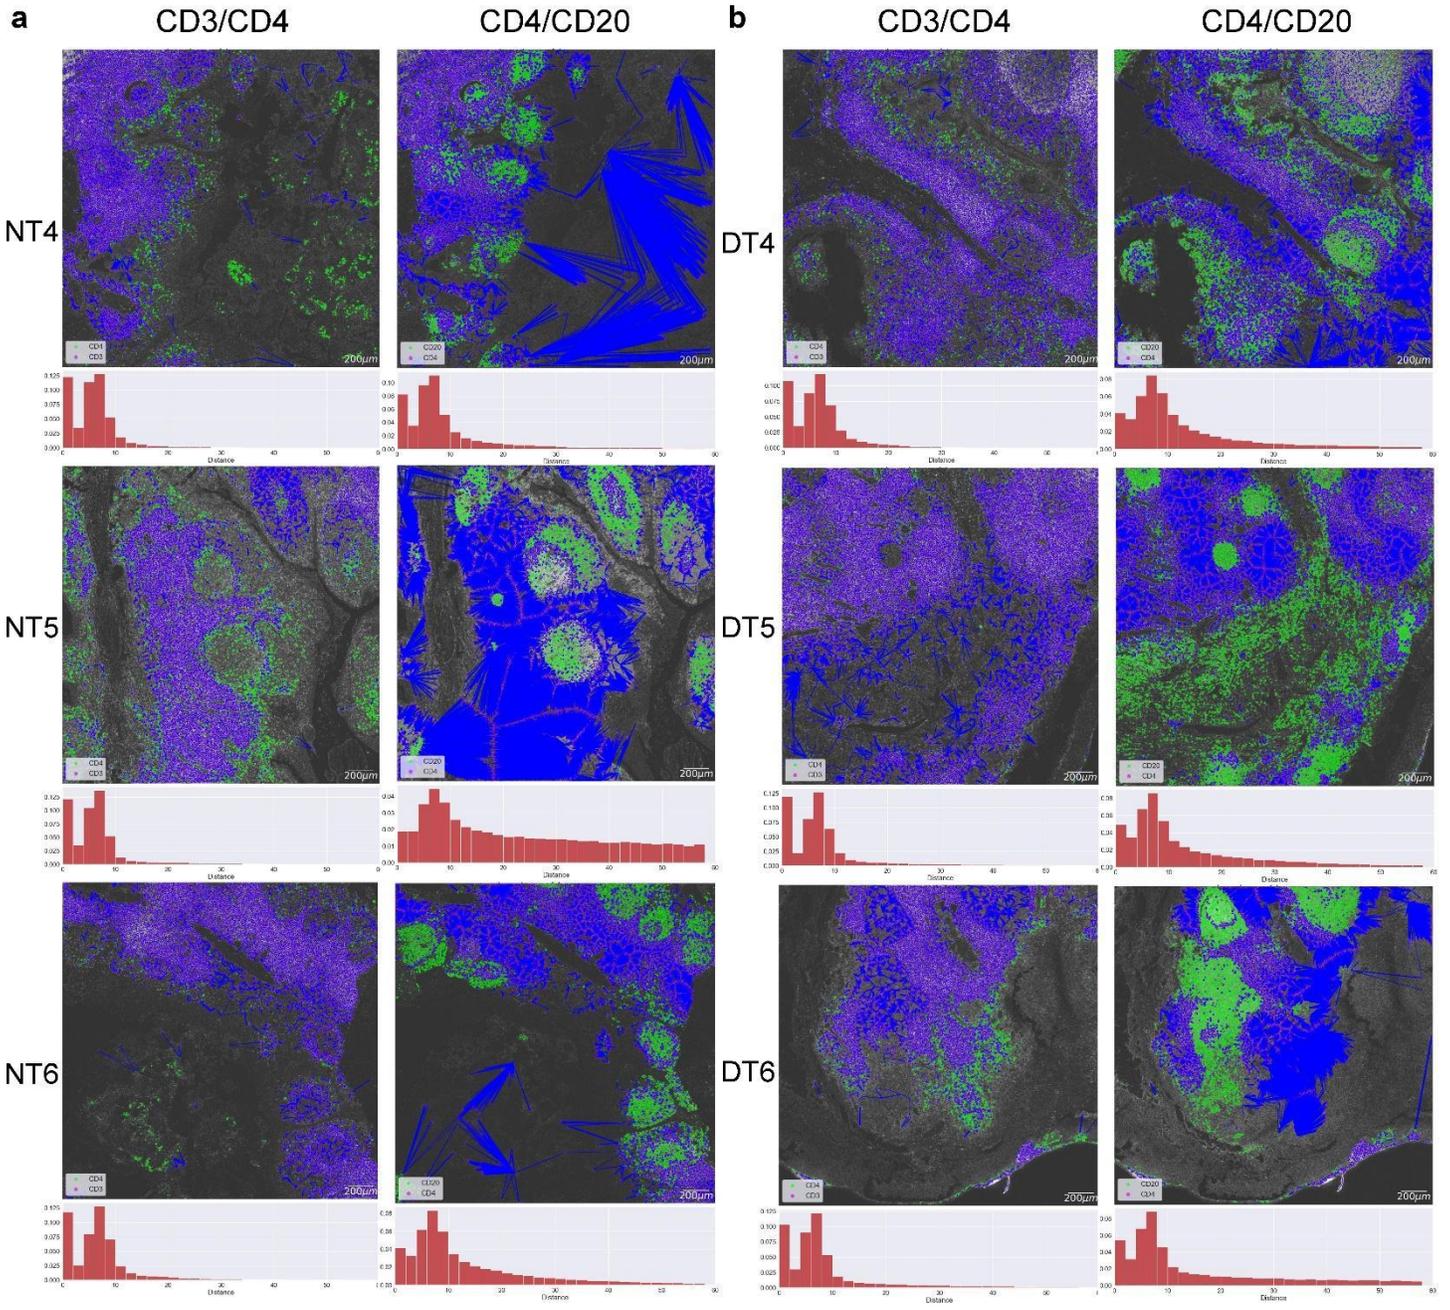

a Distinct spatial proximity maps of cell pairs within nearest neighbor distance in healthy tonsil were displayed.

The scale bar is 200 μm

b Spatial proximity maps of cell pairs within closest neighbor distance in healthy tonsil were shown.

Magenta and green color denoted the individual cells in the pair of markers.

The plots showed the CD3/CD4 and CD4/CD20 pairs of the first three datasets of both diseased and healthy tonsils. The scale bar is 200 μm .

Supplementary Figure 19. Spatial proximity maps of cell pairs within a k-neighbor distance (k-NN) in healthy and disease tonsils for T cell marker pairs.

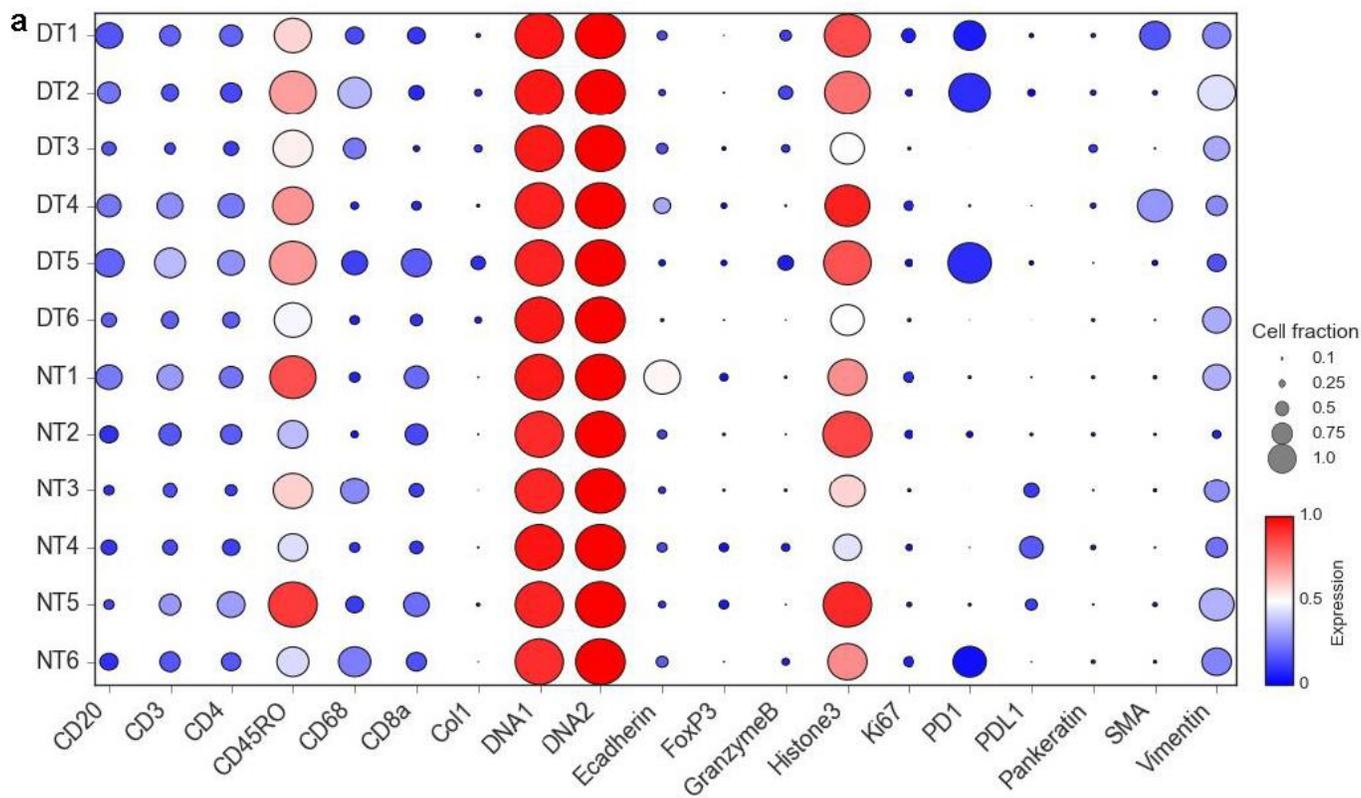

a A set of spatial proximity maps of cell pairs within nearest neighbor distance in healthy tonsil were shown.

b Spatial proximity maps of cell pairs within nearest neighbor distance in healthy tonsil were displayed.

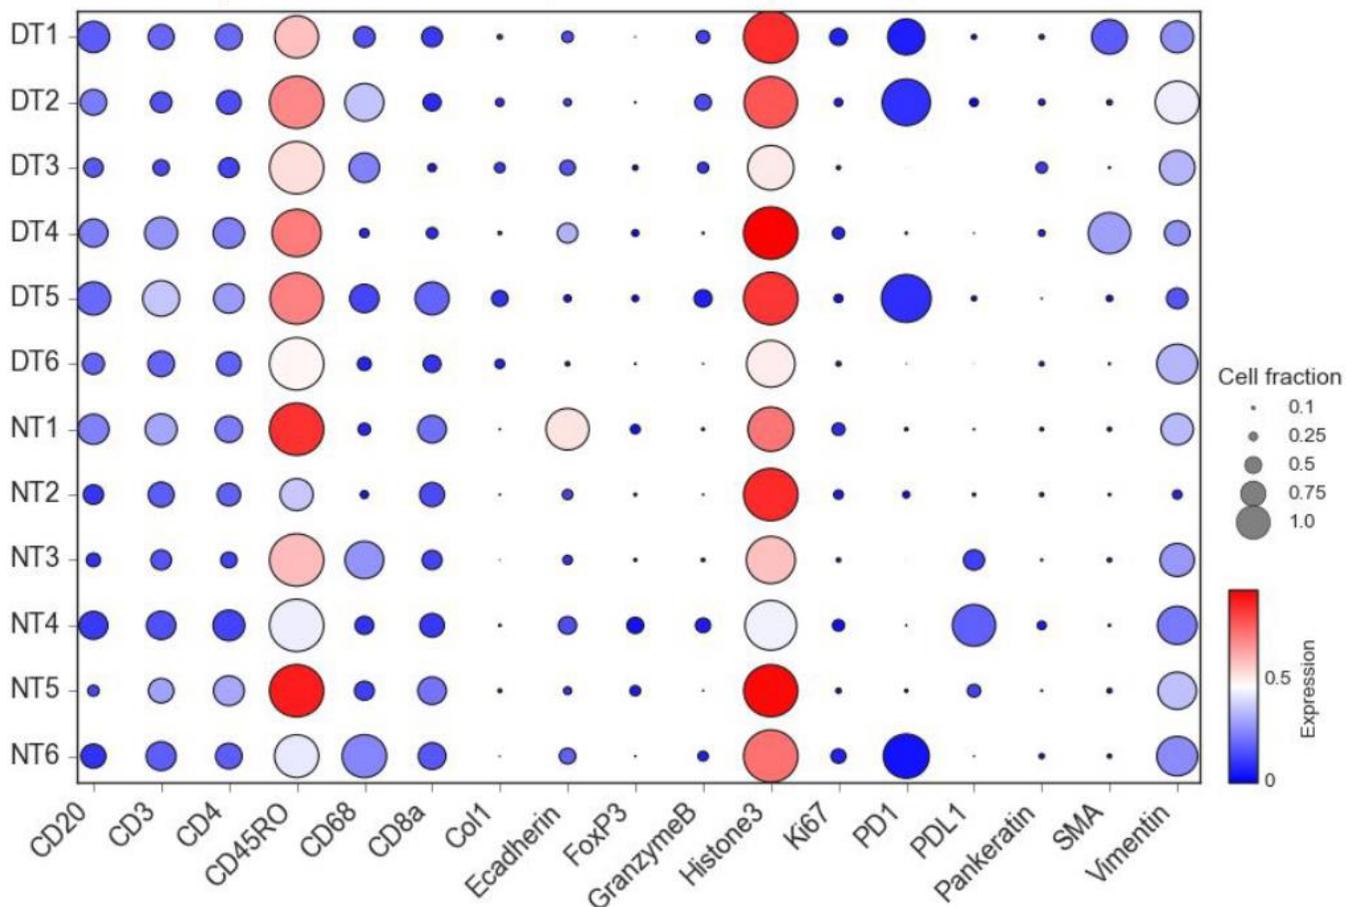

Magenta and green color indicated the individual cells in the pair of markers.

The plots displayed the CD3/CD4 and CD4/CD20 pairs of the last three datasets of both diseased and healthy tonsils. The scale bar is 200 μm .

Expression level and cell prevalence area

b Expression level and cell prevalence area without DNA markers

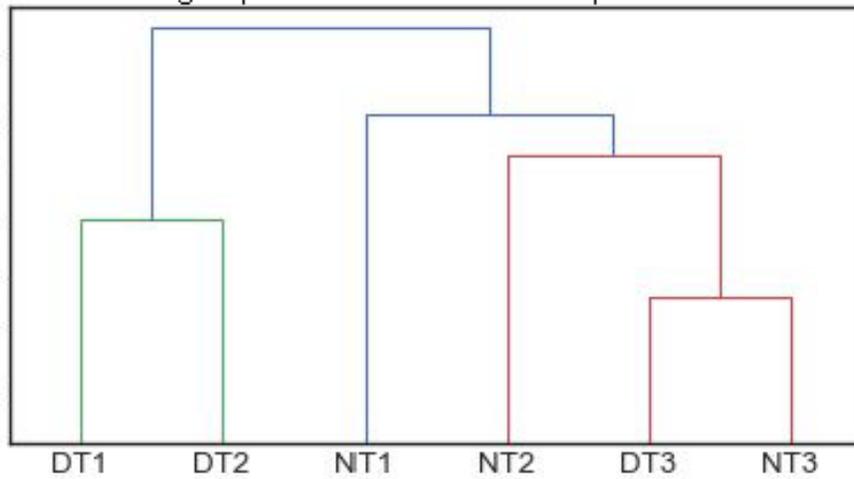

Supplementary Figure 20. Dot plot representation of markers expression level and cell prevalence area

Dot plot representation of markers expression level and cell prevalence area for all 12 ROIs. The circle area represents the cell prevalence area of a specific marker, and the colormap represents the normalized expression level.

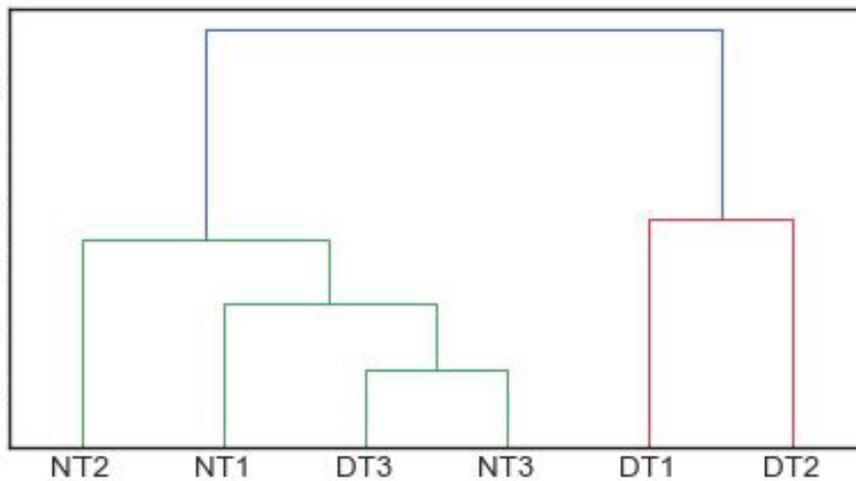

a Dot plot with DNA1 and DNA2 marker

b Dot plot without DNA1 and DNA2 marker

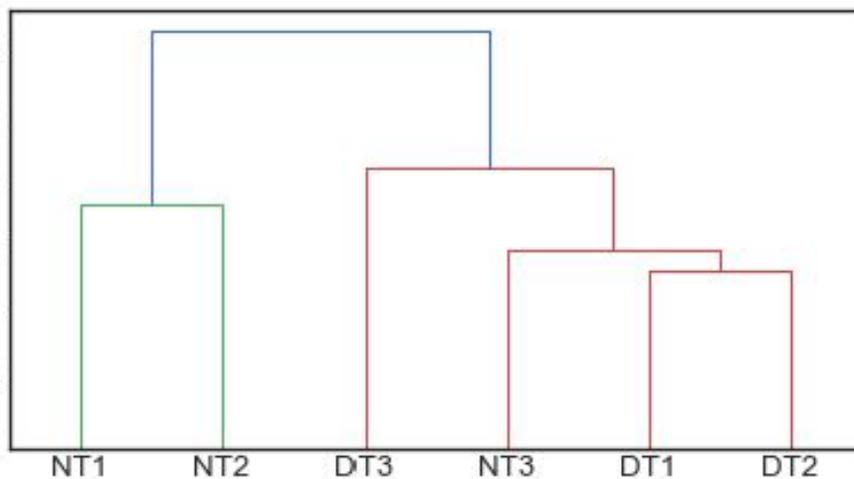

a Clustering expression level and cell prevalence area

b Clustering expression level and cell prevalence area with only CD68, GranzymeB, Ki67, PD1, Pankeratin, SMA, Vimentin markers

c Clustering pairwise marker mean cell-to-cell distance and fraction of distance inferior to 30 μm .

Supplementary Figure 21. Dataset clustering based on extracted features

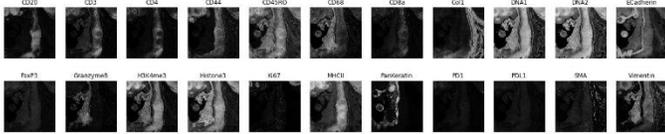

Clustering was performed in three healthy and three disease datasets based on the following conditions.

a Markers expression level and cell prevalence area for all data were analyzed.

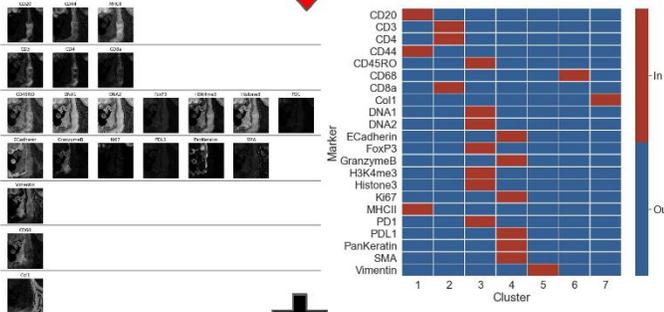

b Markers expression level and cell prevalence area using only CD68, GranzymeB, Ki67, PD1, Pankeratin, SMA, Vimentin markers were processed.

c Pairwise marker mean cell-to-cell distance and fraction of distance inferior to 30 μm .

Cell level clustering

Data Analysis Expression level

Supplementary Figure 22. SpatialViz combines top-down and bottom-up approaches.

Comparison of two mainstream analysis approaches in the right and left columns.

Both approaches utilize the same image dataset with cell segmentation and marker expression images. The bottom-up analysis processes the single-cell level information, and the top-down approach visualizes the marker anatomy.

a Top-down approach maps the multiple markers' anatomical features and then combines the single-cell level information from the bottom-up approach for a hybrid data analysis.

b Bottom-up approach starts with the single-cell segmentation information and quantifies each cell presence in the multiplexed images for quantification of cellular abundance and co-expressions.

Marker Name	Metal	Isotope	Antibody Concentration (mg/ml)	Final Dilution	Source	Catalog Number
CD20	Dy	161	0.5	1:400	Fluidigm	3161029D
CD3	Er	170	0.5	1:100	Fluidigm	3170019D

Supplementary Table 1. The isotope-labeled antibody panel for imaging mass cytometry experiments.

The table shows all the markers investigated in this study alongside their conjugated metal isotope, antibody concentration, and dilution used in the final cocktail staining mix.

Supplementary Notes:

Details about the Fluidigm Imaging Mass Cytometer

ROIs size and Imaging Time:

Regions of interest (ROIs) chosen from the tonsil samples were approximately 2500 μm x 2500 μm . The laser type is Nd: YAG with a wavelength of 213-nm. The energy output was less than or equal to 3 μJ . It takes 2 hours to image 1 mm^2 ; thereby, it took approximately 12.5 hours to acquire individual ROIs on the tonsil sections.

Description	System Specifications
Laser type	Nd: YAG
Wavelength	213 nm
Energy Output	3 μJ
Tissue thickness for full ablation	$\leq 7\mu\text{m}$ thickness
Sample size	$\geq 15 \text{ mm} \times 45 \text{ mm}$
Scan Area	$\geq 1 \text{ mm}^2 / 2\text{Hr}$ (@200Hz)

Supplementary Table 2. System specification for the Hyperion imaging system by Fluidigm.

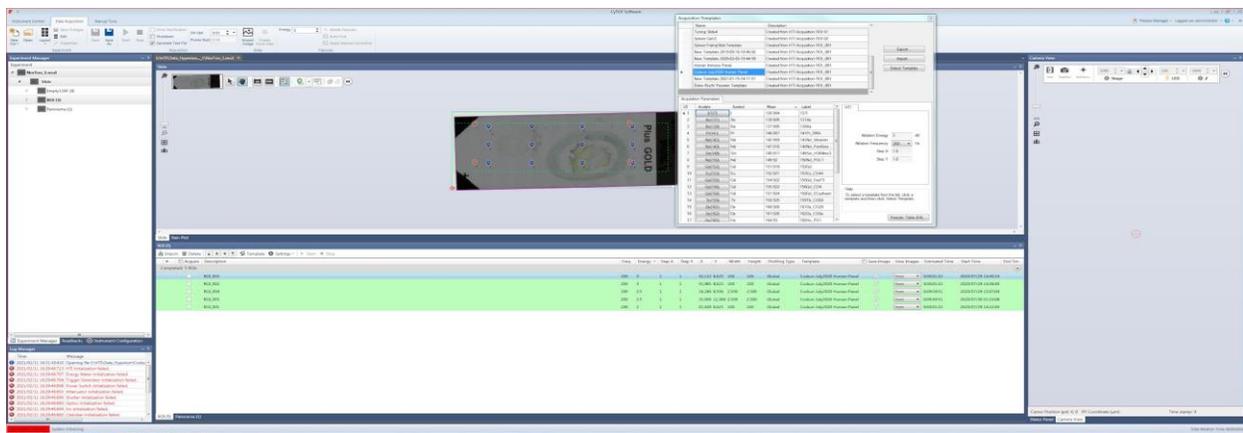

Slide	Imaging Time (H: M:S)	Laser Power (dB)	Ablation Power (Hz)
Normal Tonsil 1	9:59:51	2.5	200
Normal Tonsil 2	9:59:51	2.5	200
Normal Tonsil 3	9:59:51	2	200
Diseased Tonsil 1	7:45:34	2	200
Diseased Tonsil 2	9:59:51	2	200
Diseased Tonsil 3	9:59:51	2.5	200

Supplementary Table 3. Experimental details regarding samples, imaging time, laser power, and ablation power were used to obtain the paper's data.

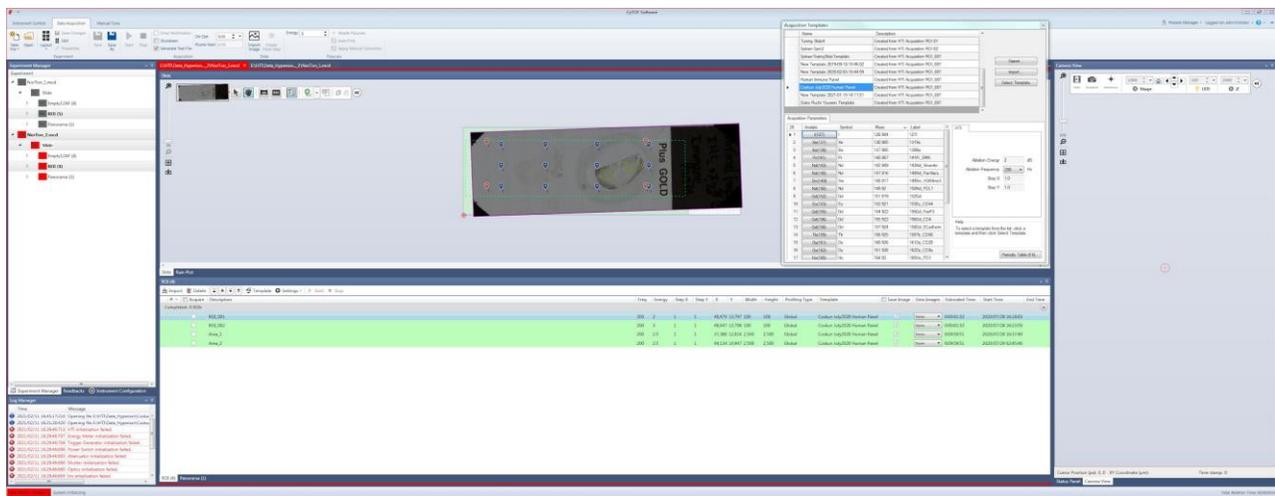

Since these product specifications can vary between different experimental runs, we also included some of the parameters associated with two experimental runs for one normal tonsil sample and one diseased tonsil sample. As shown in the snapshots below, different ablation energy values were tried out before choosing the ROIs' final values. This optimization process was done by testing out different values of ablation energies on smaller regions 100 μm x 100 μm instead of 2500 μm x 2500 μm . The value that resulted in a strong signal with the minimum background was finally chosen for the bigger ROIs.
