

## **Supplementary Information**

**Light stimulates anoxic and oligotrophic growth of glacial *Flavobacterium* strains that produce zeaxanthin**

This file contains Supplementary Figures (page 2) and Tables (page 9), which has provided additional information in the zeaxanthin-associated light stimulation of the glacial *Flavobacterium* strains in lower oxygen availability or poor nutrients.

**Supplementary figure titles and legends:**

**Supplementary Figure 1.** Assay of flexirubin produced by some *Flavobacterium* strains using 20% KOH described in Methods. Beneath are the glacial strain names, and Hh15T is a strain of *Cryobacterium luteum* isolated from the same glacier.

**Supplementary Figure 2. The spectra of carotenoids extracted from the glacial *Cryobacterium luteum* Hh15<sup>T</sup> and *Flavobacterium* XB07 and XB49.**

**Supplementary Figure 3. Light induced zeaxanthin production of the glacial *Flavobacterium* strains.** HPLC determined the carotenoid yields in the cultures of light exposure (red) and in dark (blue) from each four strains that carry the proteorhodopsin gene (lower) or not (upper). The same assay procedure was used as that in Figure 4c. Extraction of zeaxanthin was described in the methods section. Rt: retention time.

**Supplementary Figure 4. A Bayesian phylogenetic tree of the rhodopsin proteins from 37 glacial *Flavobacterium* strains and other types of rhodopsin proteins.**

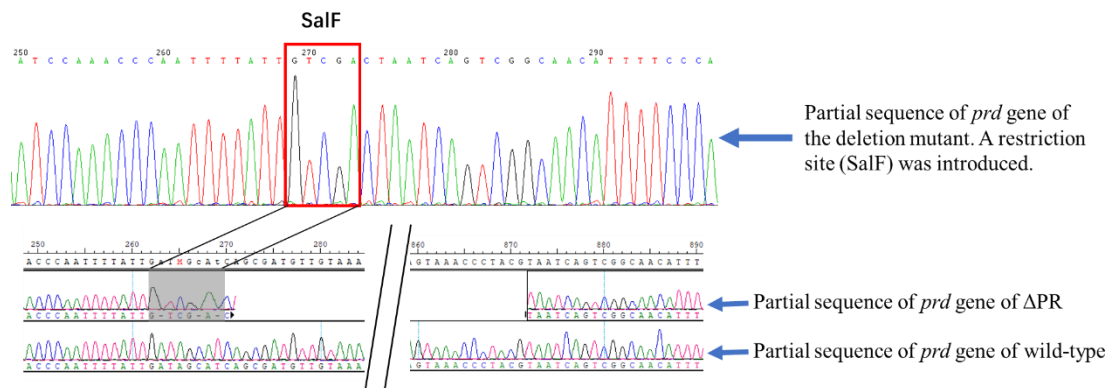

Strain numbers in blue and orange indicate those isolated from northern and southern glaciers, respectively. PR, proteorhodopsin; XR, xanthorhodopsin; HR, halorhodopsin. Bar, 0.2 amino acid substitution/site.

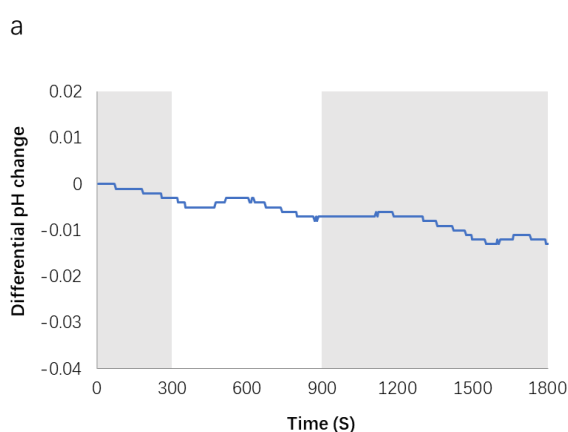

**Supplementary Figure 5. PCR verification of the absence of the not sequenced *prd* gene in some glacial *Flavobacterium* genomes.** A pair of primers listed in Supplementary Table S2 that specifically hybrid to the PR gene was used. Strains that have the *prd* gene sequenced were included as the references. M, DNA ladder.

**Supplementary Figure 6. Verification of the *prd* gene deletion in strain XB07 via DNA sequencing.** The genomic DNAs of strain XB07 wild type and the *prd* gene deletion mutant were sanger sequenced using primer PR\_delR (Supplementary Table 2) on ABI 3730. A sequencing chart presents an insertion of cleavage motif of the restriction DNase SalF replaced the *prd* encoding region comparing with that of the wild type.

**Supplementary Figure 7. Assay of light-driven proton pump activity (a) and enhanced glucose consumption (b) in the glacial *Flavobacterium* XB07.** **a.** Using the protocol of Feng et al. (2013), light-driven proton pump activity was determined via measuring the pH changes in the cell suspension (initial pH 7.0) at 14°C under photo flux of 50 photon m<sup>-2</sup>·s<sup>-1</sup>. Shaded areas represent dark conditions. **b.** The stationary spent PGY cultures that were grown in light and dark, and at 7 °C and 14 °C were assayed for the residual glucose contents using 3,5-dinitrosalicylic acid (DNS) reagent [Miller, 1959]. Triplicated cultures were assayed, and the averages and standard derivations are shown.

## Supplementary tables

Supplementary Table 1. Strains used in this study\*

Isolates	Strain No. in CGMCC	16S rRNA gene Acc. #	Most related species (16S rRNA similarity %)	Isolation location	Opt. T (°C)	Genome acc No of NCBI
