

**Target of Rapamycin, *PvTOR*, Is a Key Regulator of Arbuscule Development
during Mycorrhizal Symbiosis in *Phaseolus***

Manoj-Kumar Arthikala^{1#}, Kalpana Nanjareddy¹, Lourdes Blanco², Xóchitl Alvarado-Affantranger³, Miguel Lara²

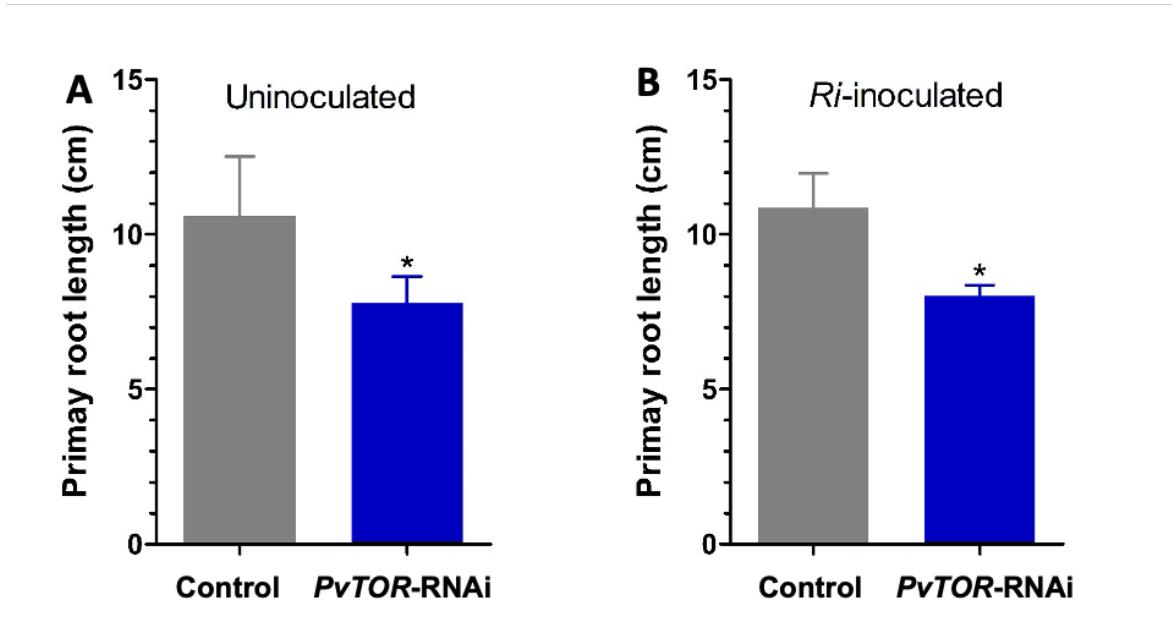

Figure S1. Knockdown of *PvTOR* inhibits primary root length in *P. vulgaris*. (A-B) Primary root length in uninoculated (**A**) and *Ri*-inoculated (**B**) transgenic roots of control and *PvTOR*-RNAi at 12 days post inoculation. The statistical significance of differences between control and *PvTOR*-RNAi roots was determined using an unpaired two-tailed Student's *t*-test (*, $P < 0.05$). Error bars refer to the SD of the mean of three biological replicates ($n > 30$). *Ri*, *R. irregularis*.

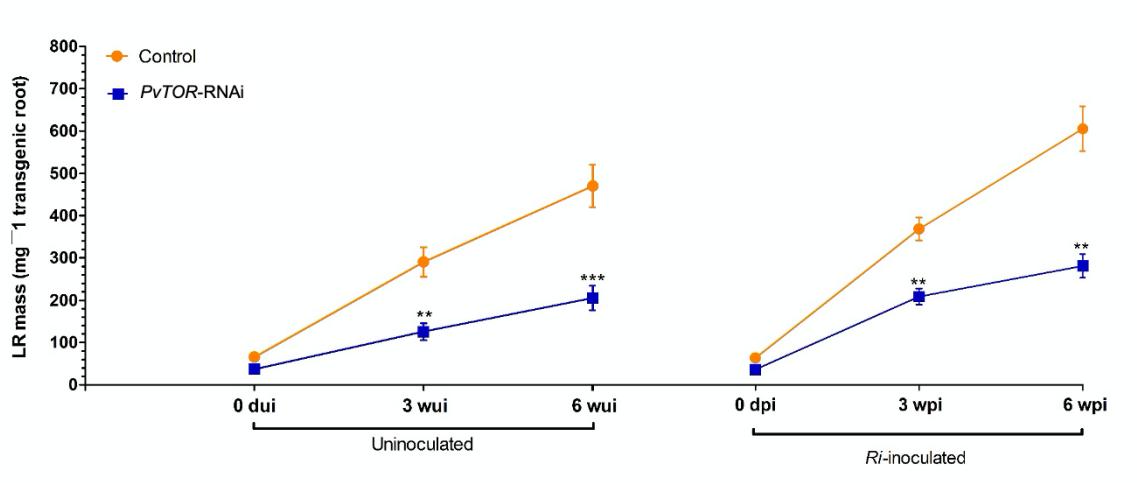

Figure S2. Quantitative analysis of lateral root mass in uninoculated and *Ri*-inoculated transgenic roots of control and *PvTOR-RNAi* at different time points. The statistical significance of differences between control and *PvTOR-RNAi* roots was determined using an unpaired two-tailed Student's *t*-test (**, $P < 0.01$; ***, $P < 0.001$). Error bars refer to the SE of the mean of three biological replicates ($n > 30$). LR, lateral root; *Ri*, *R. irregularis*; dui, day(s) uninoculated; dpi, day(s) post inoculation; wpi, week(s) post inoculation.

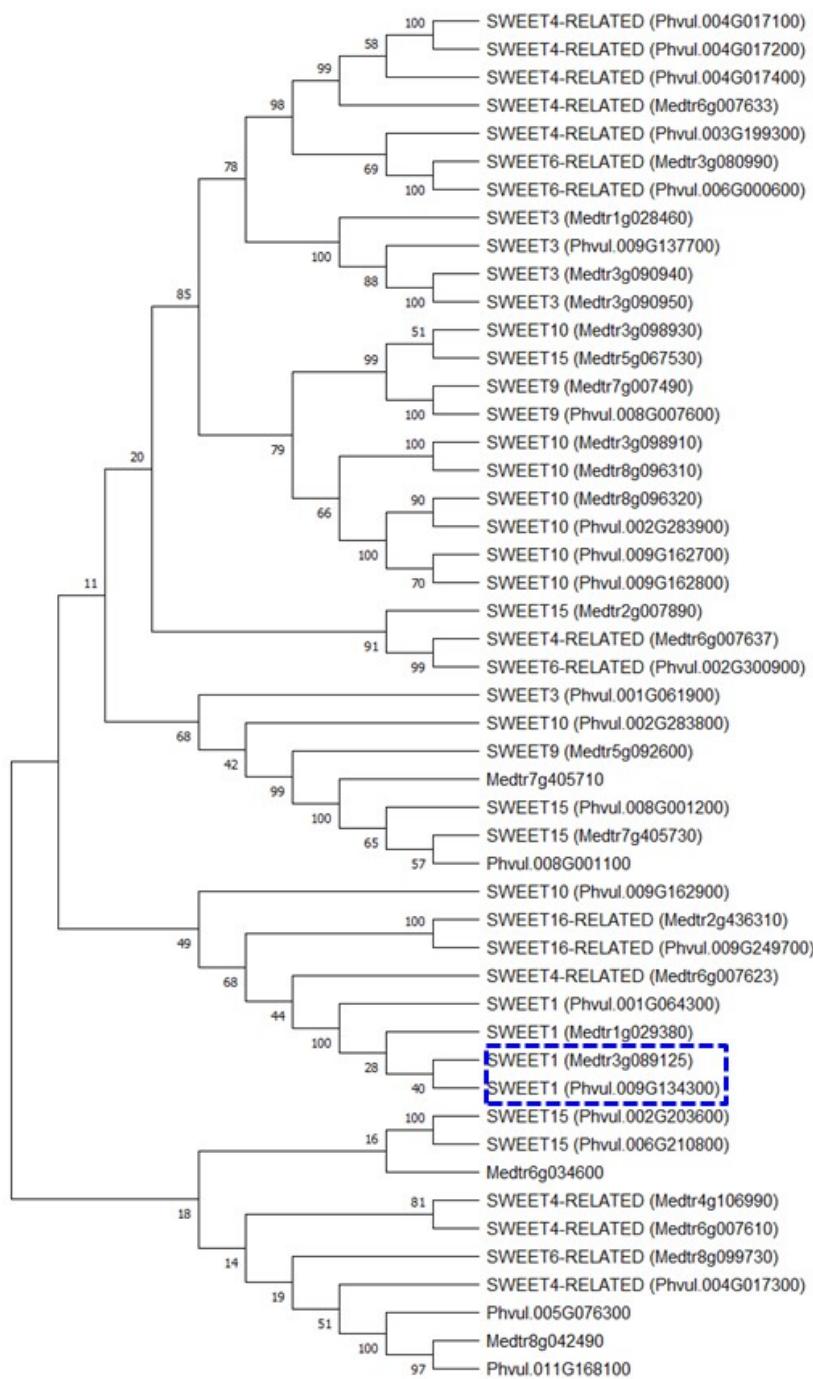

Figure S3. Phylogenetic analysis of *Phaseolus vulgaris* and *Medicago truncatula* SWEET genes. Protein sequences of SWEET homologs were identified in the Phytozome database. The phylogenetic tree was constructed using MEGA-X-10.1.1 software with the neighbor-joining (NJ) tree method with 1000 bootstrap values.

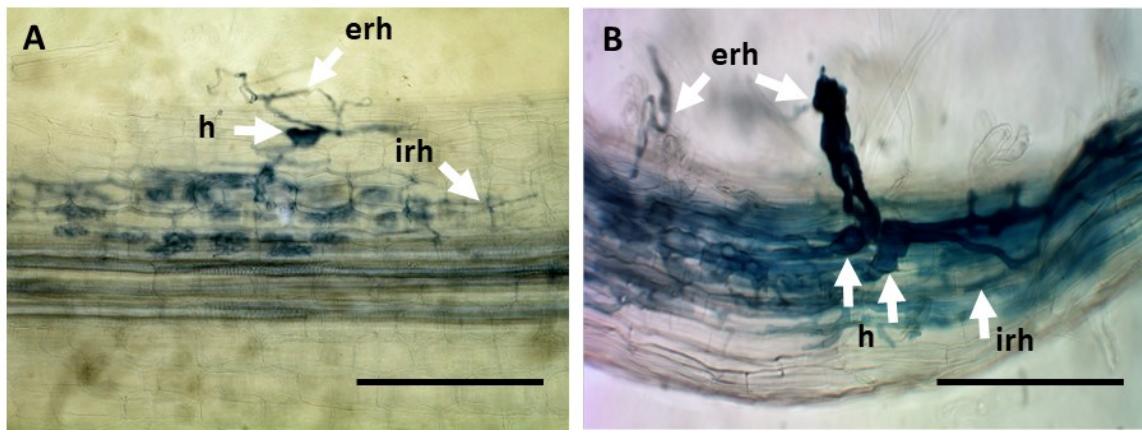

Figure S4. Micrograph of *R. irregularis*-inoculated transgenic roots showing hyphopodia at 3wpi. (A) Control and (B) *PvTOR*-RNAi. wpi, week(s) post inoculation; erh, extraradical hyphae; irh, intraradical hyphae; h, hyphopodia. Bars = 1 mm.

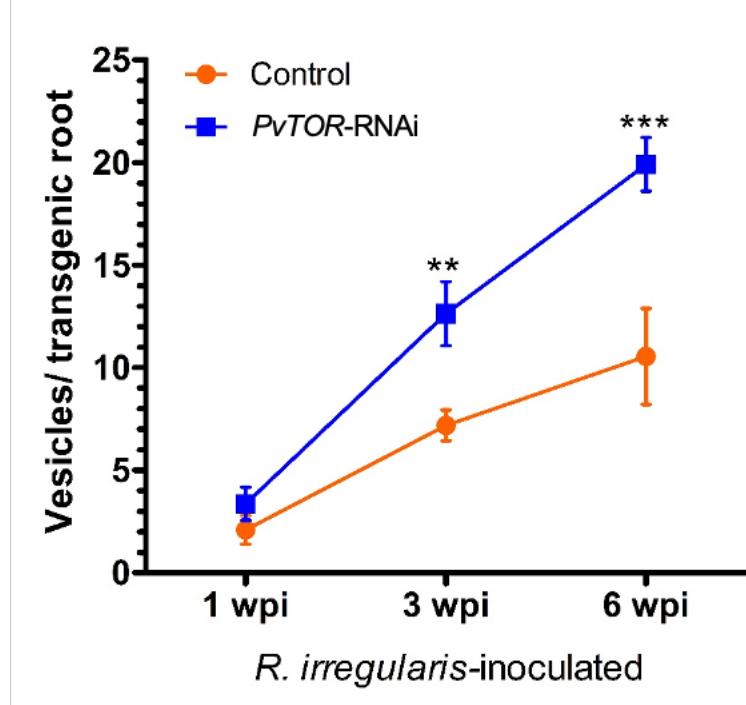

Figure S5. Quantification of vesicles in mycorrhized *P. vulgaris* control and *PvTOR-RNAi* roots at 1, 3 and 6 wpi. The statistical significance of differences between control and *PvTOR-RNAi* roots was determined using an unpaired two-tailed Student's *t*-test (**, $P < 0.01$; ***, $P < 0.001$). Error bars refer to the SD of the mean of three biological replicates ($n > 30$). wpi, week(s) post inoculation.

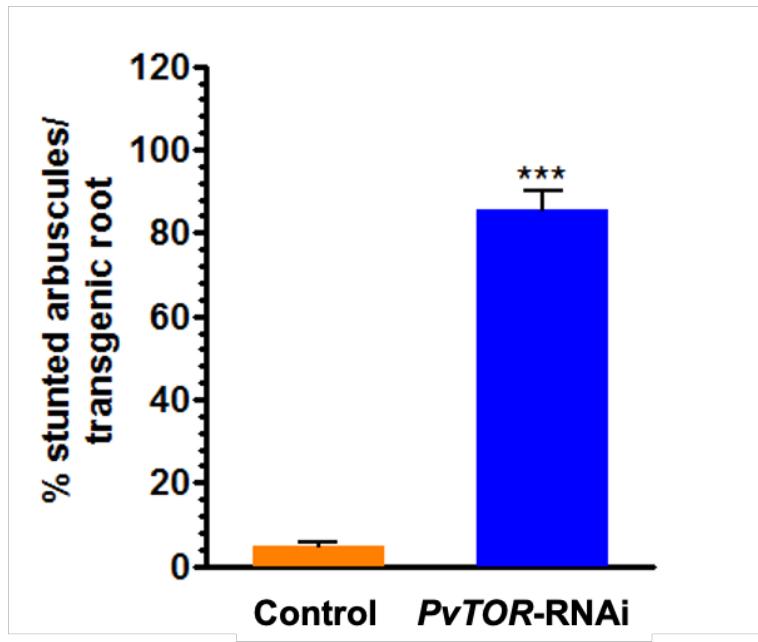

Figure S6. Quantification of stunted arbuscules per transgenic root of control and *PvTOR-RNAi* at 6 wpi with *R. irregularis*. The statistical significance of differences between control and *PvTOR-RNAi* roots was determined using an unpaired two-tailed Student's *t*-test (***, $P < 0.001$). Error bars refer to the SE of the mean of three biological replicates ($n > 30$). wpi, weeks post inoculation.

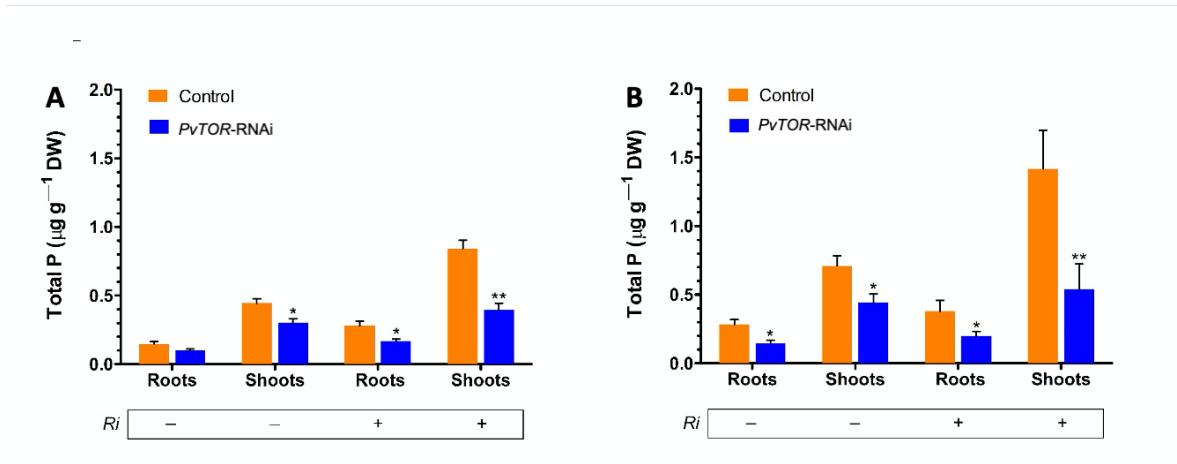

Figure S7. Total root and shoot phosphorus (P) concentration in mycorrhized composite plants of control and *PvTOR-RNAi* at (A) 3 wpi and (B) 6 wpi. The statistical significance of differences between control and *PvTOR-RNAi* samples was determined using an unpaired two-tailed Student's *t*-test (*, $P < 0.05$; **, $P < 0.01$). Error bars refer to the SD of the mean of three biological replicates ($n > 12$). wpi, week(s) post inoculation, *Ri*, *R. irregularis*.

Table S1: Primer sequences of *Phaseolus vulgaris* genes used to generate constructs and perform quantitative RT-PCR.
