

Supplementary Fig. S1. Differentiation from CD56^{bright} to CD56^{dim}/CD94^{high} to CD56^{dim}/CD94^{low} NK cells is accompanied by increasing requirements for IL-15 to induce their proliferation. Various NK cell subsets were sorted from PBMCs of normal donors, CFSE-labeled, cultured for 7 days, and their CFSE dilution as a measure of proliferation was determined by FACS.
