This file contains 9 figures (Fig. S1-S9) and 4 tables (Tables S1-S4), as well as Movie Legends.

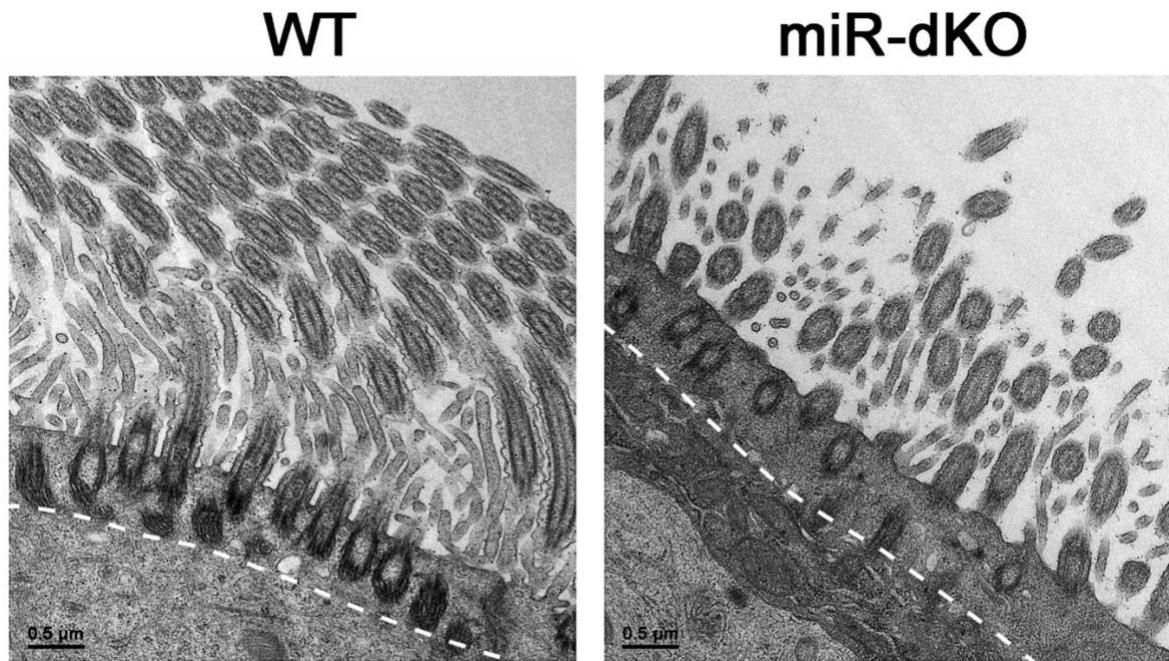

Fig. S1. TEM images showing the ultra-structure of the WT and miR-dKO oviductal epithelia. Basal bodies (broken dash lines) are abundant and well in the WT oviductal epithelium, but the basal bodies are much fewer and misaligned in the miR-dKO oviductal epithelium. Scale bar = 0.5 μ m. Five WT and miR-dKO mice were analyzed, and representative images are shown.

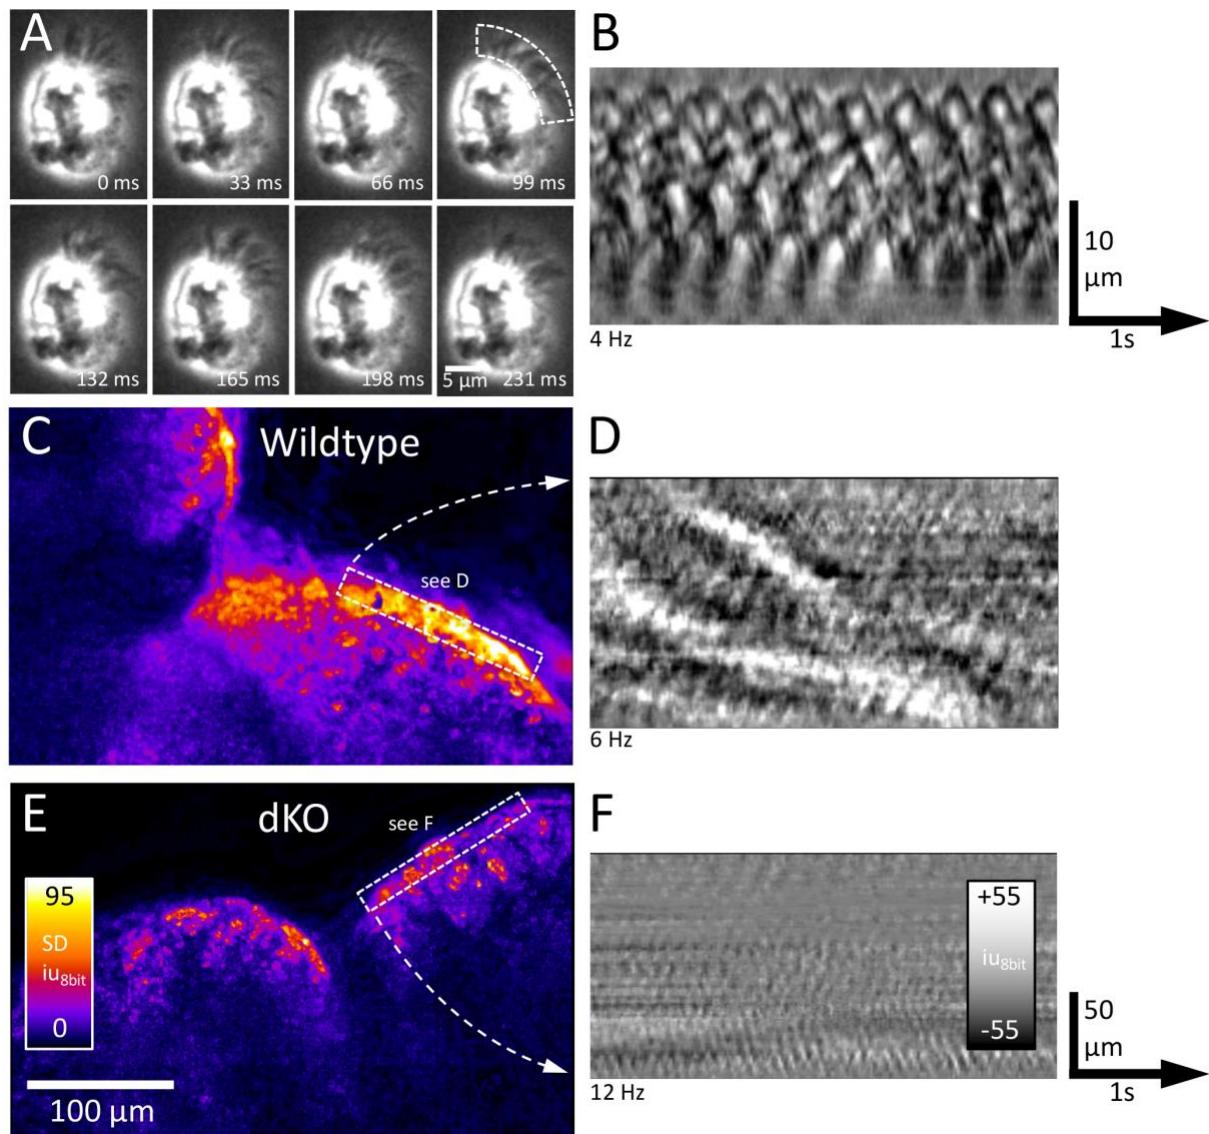

Fig. S2. Cilia movement in the epithelium of oviductal infundibulum. (A) Isolated ciliated cells from the infundibulum of wildtype mice were bulbous with ciliated membrane typically occupying a quadrant of the cell. (B) Oscillations of cilia, detected as changes in translucency due to regional clumping and separation of cilia was monitored using spatiotemporal maps constructed in an arc around the fringe. While the overall frequency of oscillation was relatively uniform within the fringe, slight changes in the phase of movement in small regions created interference patterns that changed every 1-2 seconds. (C) Wholemount oviduct preparation from a wildtype mouse that shows intense cilia movement, visualized as the deviation of intensity using standard deviation maps. (D) Spatiotemporal maps constructed along the edge of the epithelial lining (white dashed rectangle) showed uniform, strong oscillations from which slow propagating sweeping motions emerged (see white streaks). (E) Wholemount oviduct preparations of the infundibulum from miR-dKO (dKO) mice showed patchy regions of the epithelial lining that had weak oscillations. (F) The small amplitude oscillations of cilia occurred at a high frequency and emergent sweeping motions were absent.

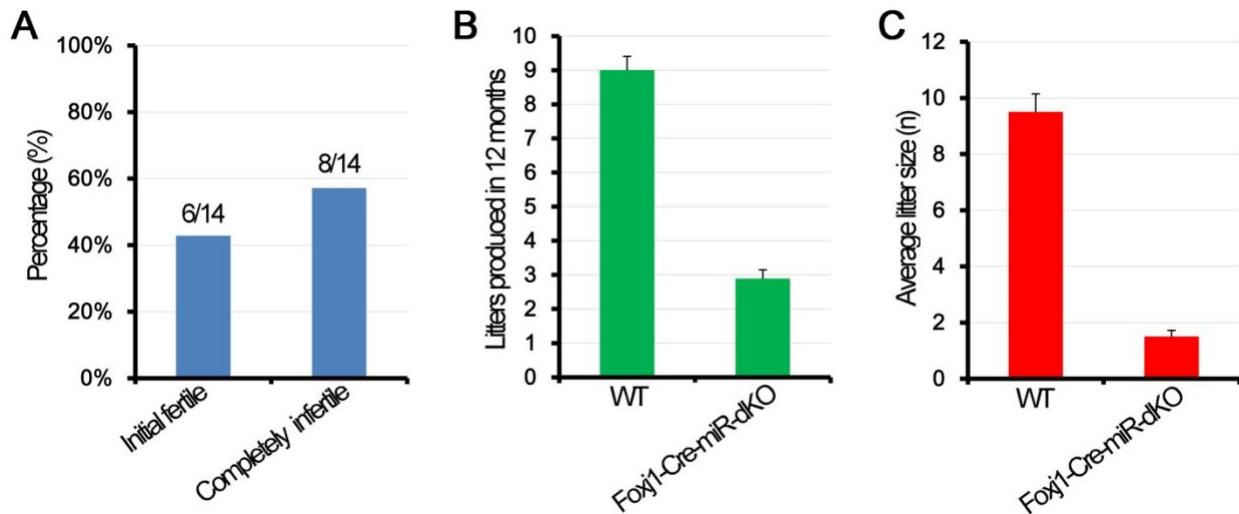

Fig. S3. Fecundity of female mice with cilia-specific knockout of miR-34b/c and miR-449 clusters (Foxj1-Cre-miR-dKO). (A) A total of 14 Foxj1-Cre-miR-dKO females were mated with fertility-proved males (one male with one female) for 12 months to test fecundity. ~57% (8 out of 14) Foxj1-Cre-miR-dKO females were completely infertile, whereas the rest (~43%) were initially fertile, but their fecundity decreased rapidly with age and became completely infertile after 6 months of age. (B) The number of litters produced by WT and initially fertile Foxj1-Cre-miR-dKO females ($n=6$) during the 12 month-long fecundity tests. (C) Litter size of WT and initially fertile Foxj1-Cre-miR-dKO females ($n=6$) during the 12 month-long fecundity tests.

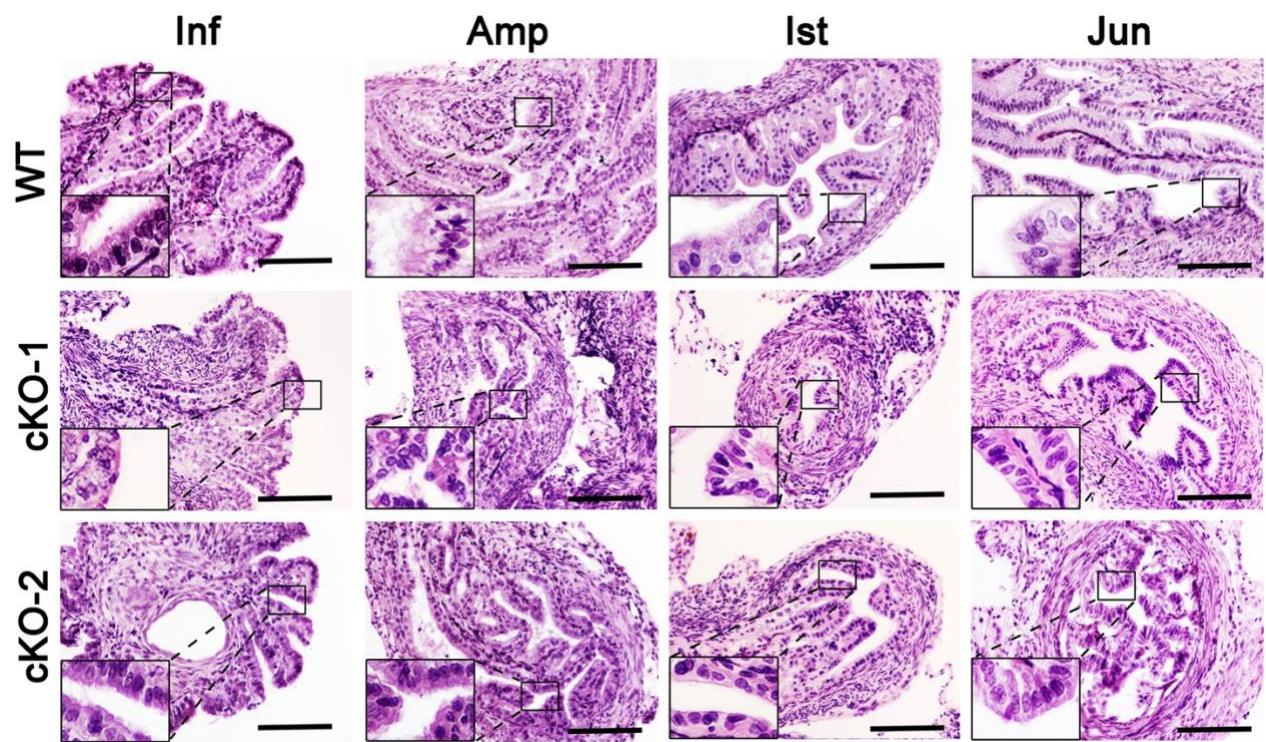

Fig. S4. Histology of the WT and conditional KO (*Foxj1-Cre-miR-dKO*) oviducts. The upper panels show normal cilia in the epithelium of infundibulum (Inf), ampulla (Amp), isthmus (Ist) and uterotubal junction (Jun). The middle panels indicate that cilia are absent in the epithelium of the four oviductal regions in those completely infertile *Foxj1-Cre-miR-dKO* females (cKO-1). The lower panels display partial cilia in the epithelium of the four oviductal regions in those initially fertile *Foxj1-Cre-miR-dKO* females (cKO-2). Insets represent the digital enlargement of framed areas in the original panels. n=4 oviducts. Scale bar = 50μm.

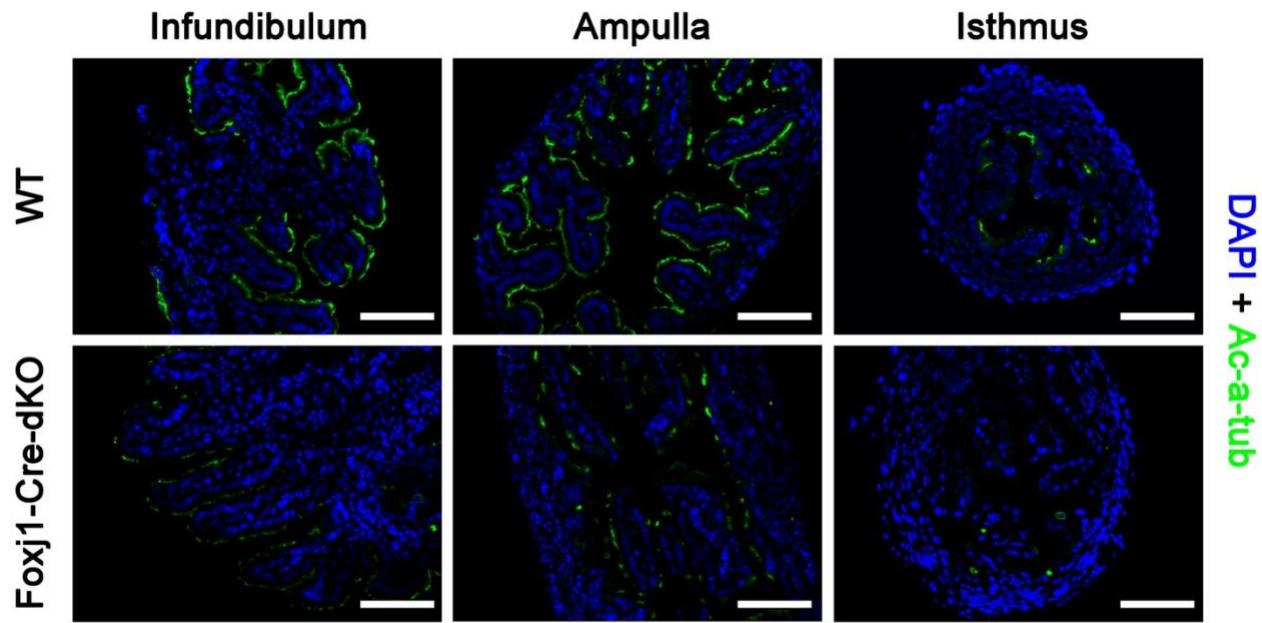

Fig. S5. Immunofluorescent staining of Ac-a-Tubulin, a ciliated cell marker, in the infundibulum, ampulla and isthmus of WT and Foxj1-Cre-miR-dKO oviducts. Three mice for each genotype were analyzed. Scale bar = 50 μ m.

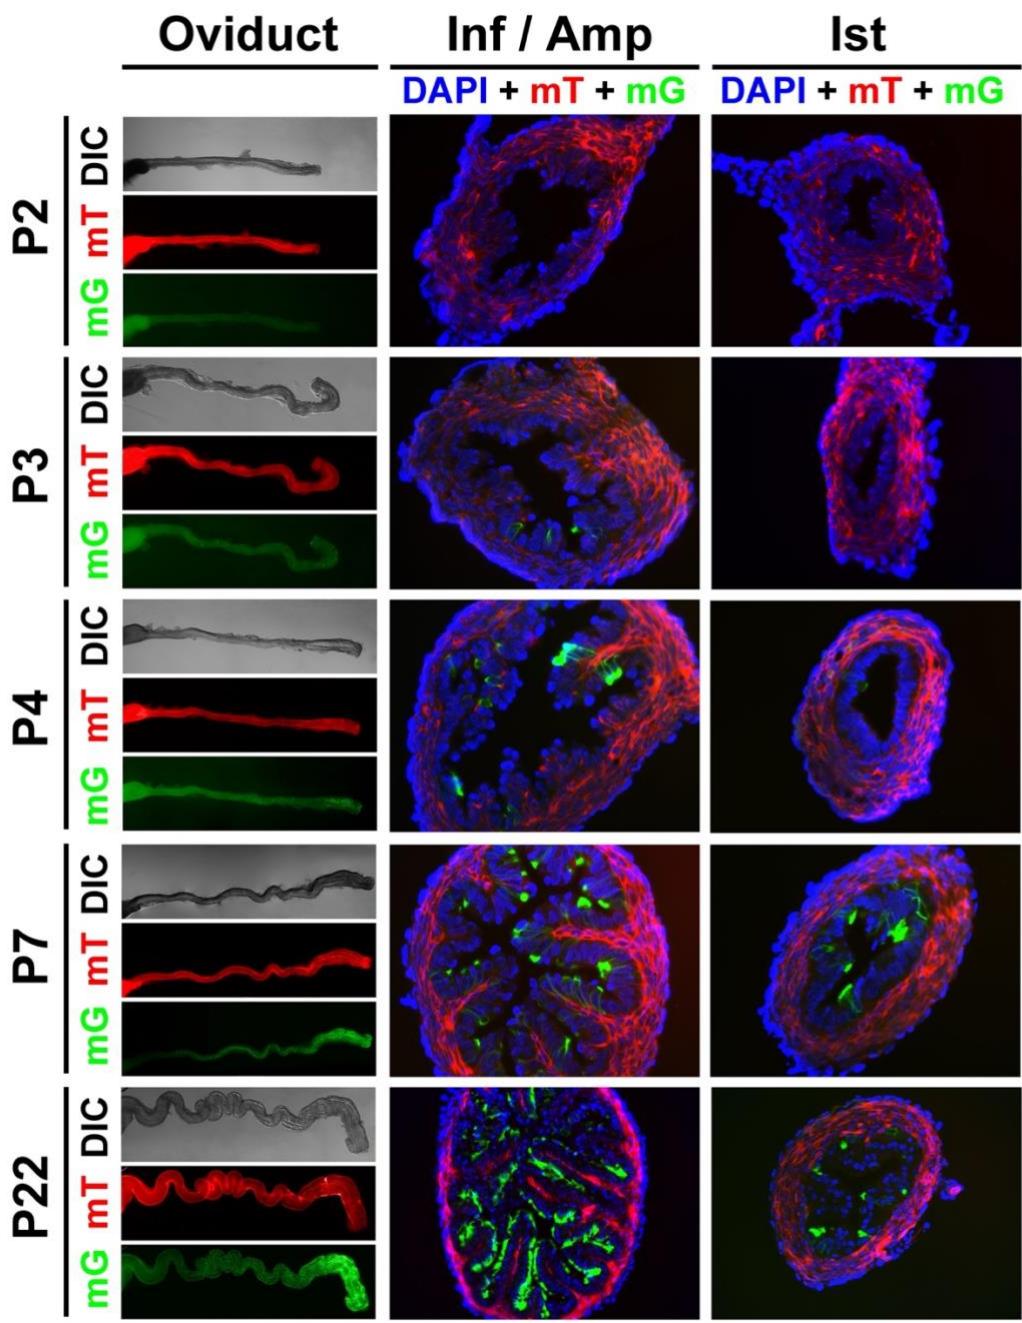

Fig. S6. Generation of a ciliated cell-specific, dual reporter mouse line (*Foxj1-Cre-mTmG*), which expresses membrane-tagged GFP (mG) in ciliated cells in the oviductal epithelium. In *Foxj1-Cre-mTmG* female mice, ciliated cells are mG-positive, whereas non-ciliated cells remain mT-positive (red). mG-positive ciliated cells start to appear in the *Foxj1-Cre-mTmG* oviducts at postnatal day 4 (P4), suggesting that *Foxj1-Cre*-mediated inactivation of the two miRNA clusters occurs after P4.

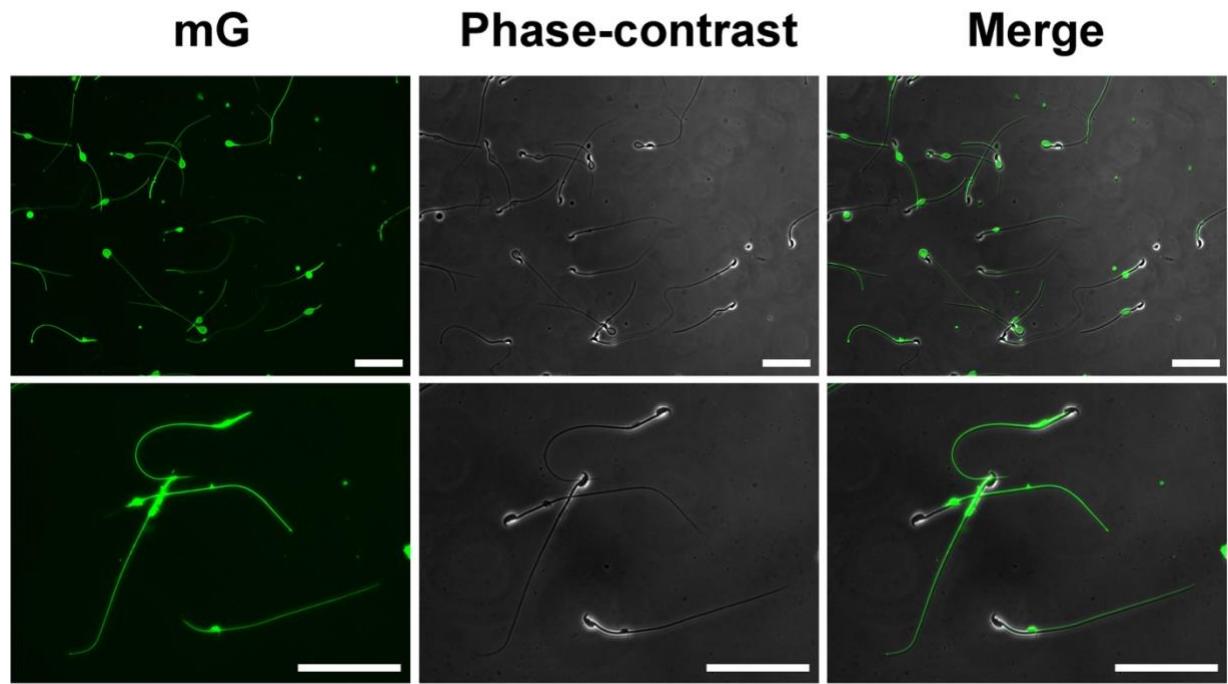

Fig. S7. Low- (Upper panels) and high-power (Lower panels) micrographs showing the “green” fluorescent sperm derived from *Stra8-Cre-mTmG^{+/Tg}* males. Scale bar= 50μm. Scale bar= 50μm.

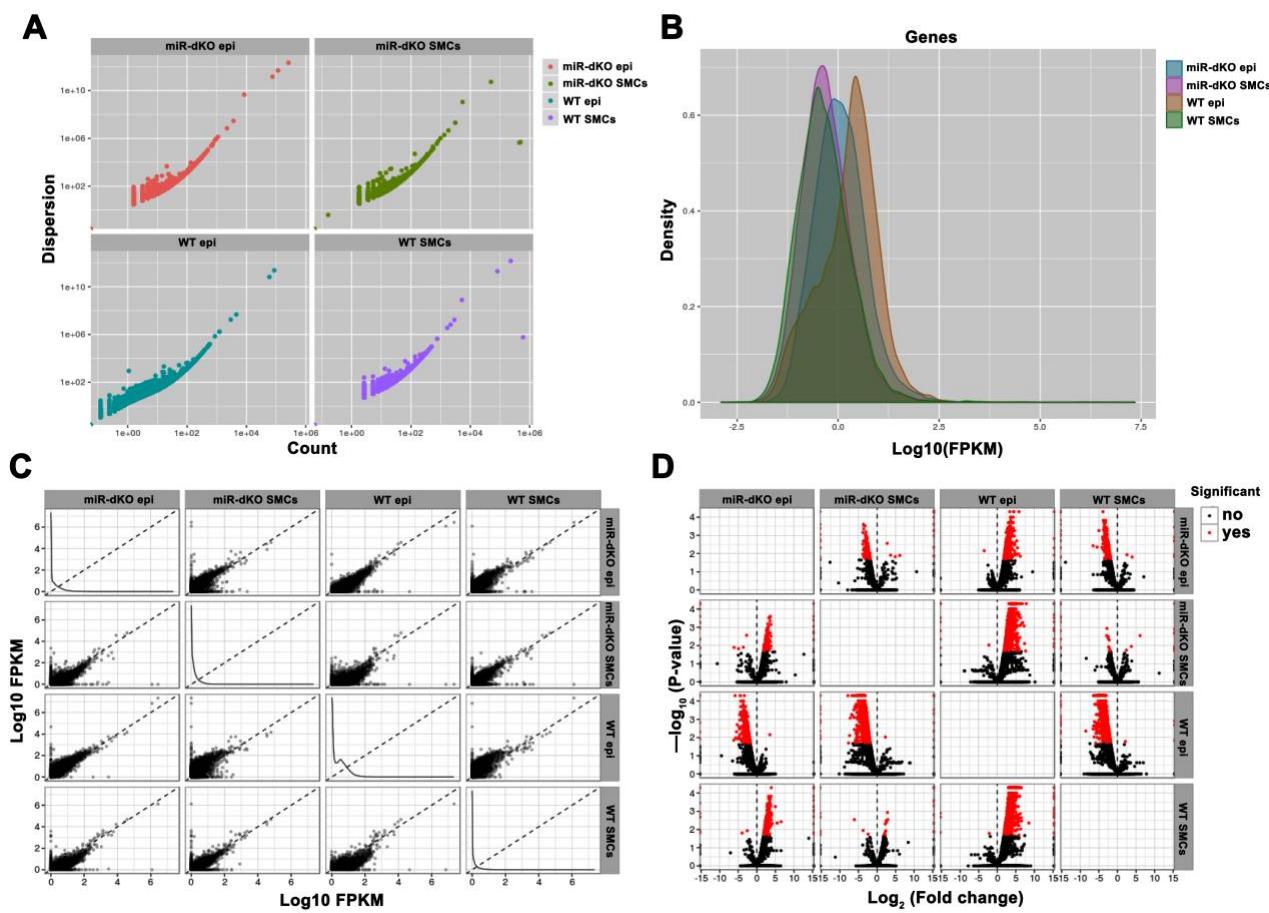

Fig. S8. Quality control data of the RNA-Seq analyses. (A) Overdispersion plots demonstrating the estimated overdispersion for each sample as a quality control measure. (B) Density plots showing the distribution of \log_{10} normalized FPKM scores across four sample groups. (C) Scatterplot matrix showing the pairwise scatterplots of the \log_{10} normalized FPKM scores across four sample groups. (D) The volcano plot showing the pairwise volcano plots of the \log_2 fold change and associated \log_{10} p-value across four sample groups.

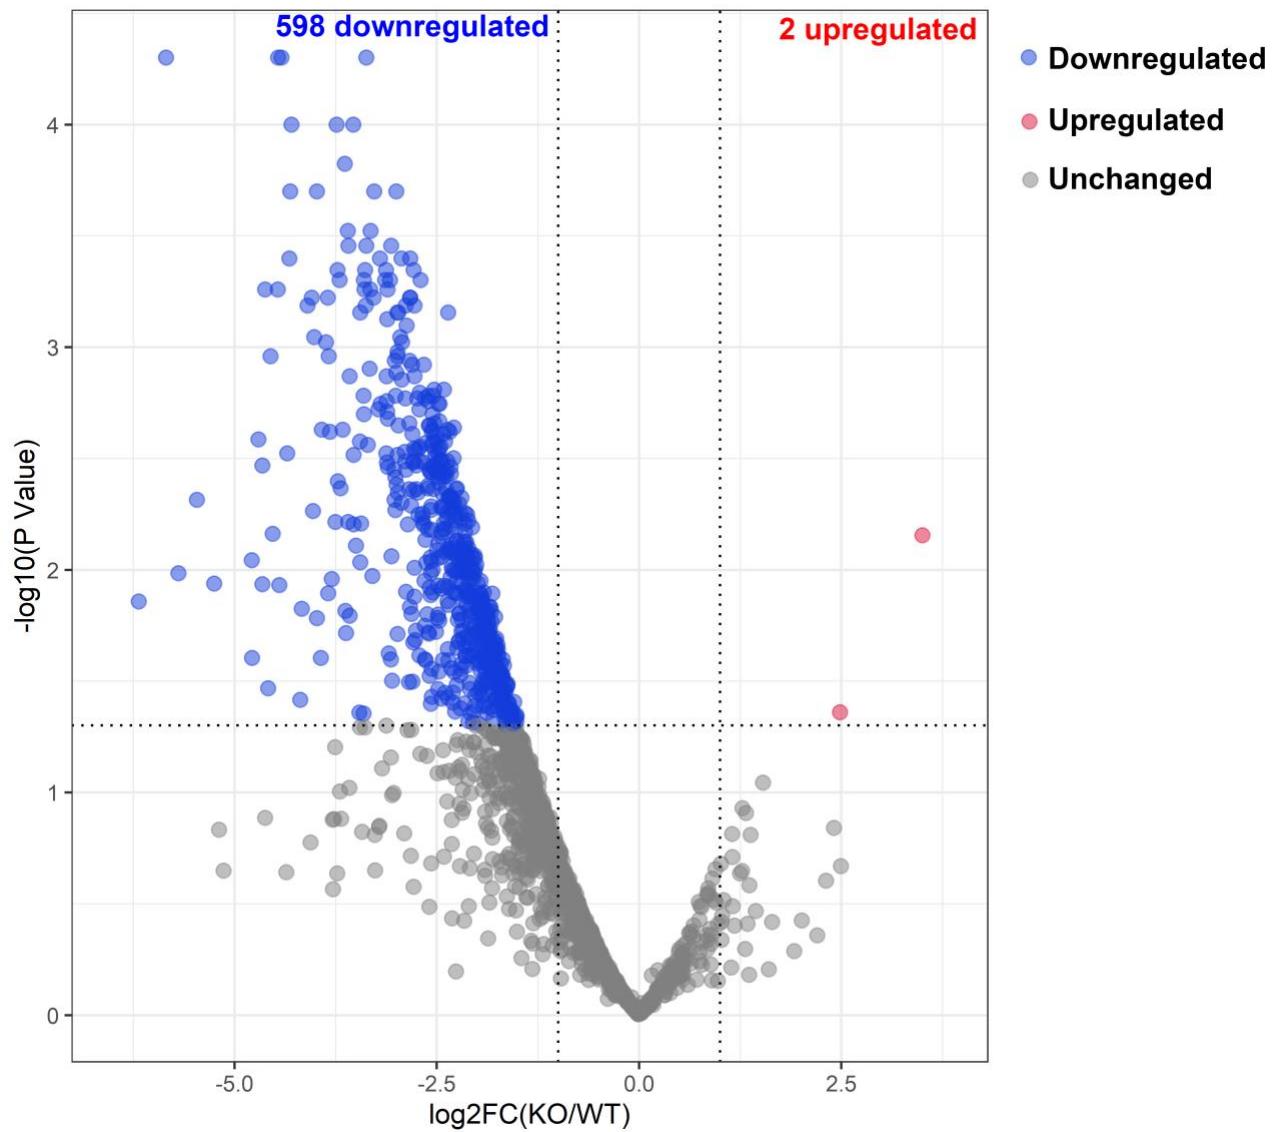

Fig. S9. Scatter plots showing the differential expression genes (DEGs) in the epithelium cells of miR-dKO and WT oviducts determined by RNA-seq analyses. A total of 600 genes were identified to be dysregulated in miR-dKO epithelium cells compared to that of WT controls. Blue dots indicate downregulated genes identified in miR-dKO oviductal epithelium cells, and red dots indicate upregulated genes identified in miR-dKO oviductal epithelium cells.

Movie Legends:

Movie S1. Cilia beating in the WT oviductal epithelium.

Movie S2. Cilia beating in the miR-dKO oviductal epithelium.

Movie S3. Dispersed single cells of the WT oviductal epithelium under lower magnification (10X).

Movie S4. Dispersed single cells of the miR-dKO oviductal epithelium under lower magnification (10X).

Movie S5. One WT ciliated cell in the infundibulum region under higher magnification (100X).

Movie S6. One miR-dKO ciliated cell with immature cilia in the infundibulum region under higher magnification (100X).

Table S1. The significantly dys-regulated gene transcripts as determined by RNA-Seq in oviductal epithelium cells of miR-dKO mice.
