

**A chromosome-level *Camptotheca acuminata* genome assembly provides
insights into the evolutionary origin of camptothecin biosynthesis**

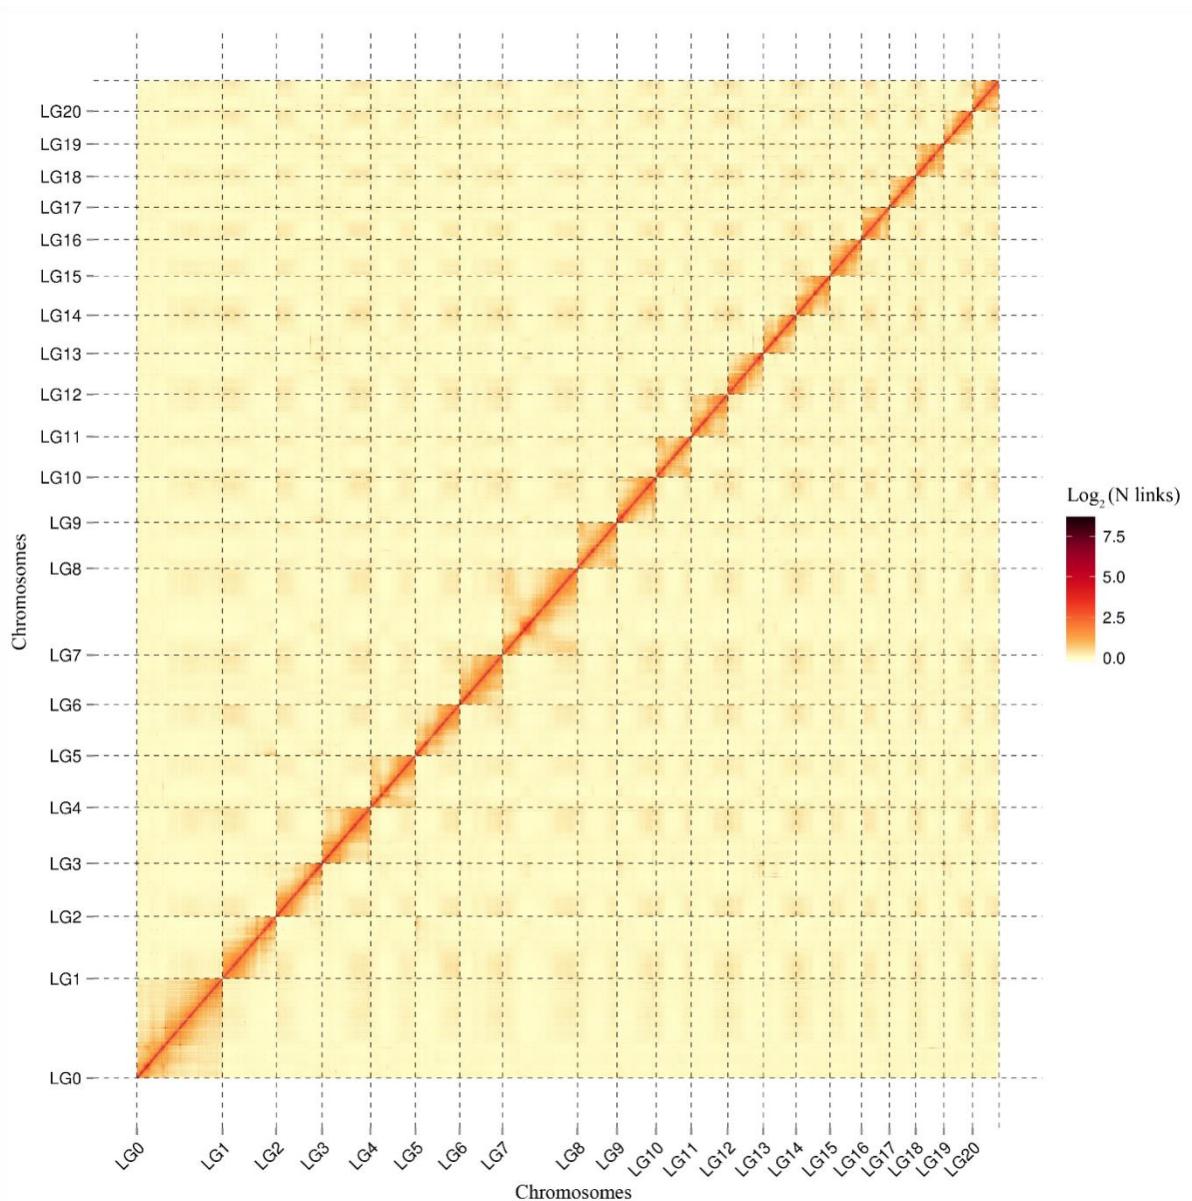

Kang *et al.*

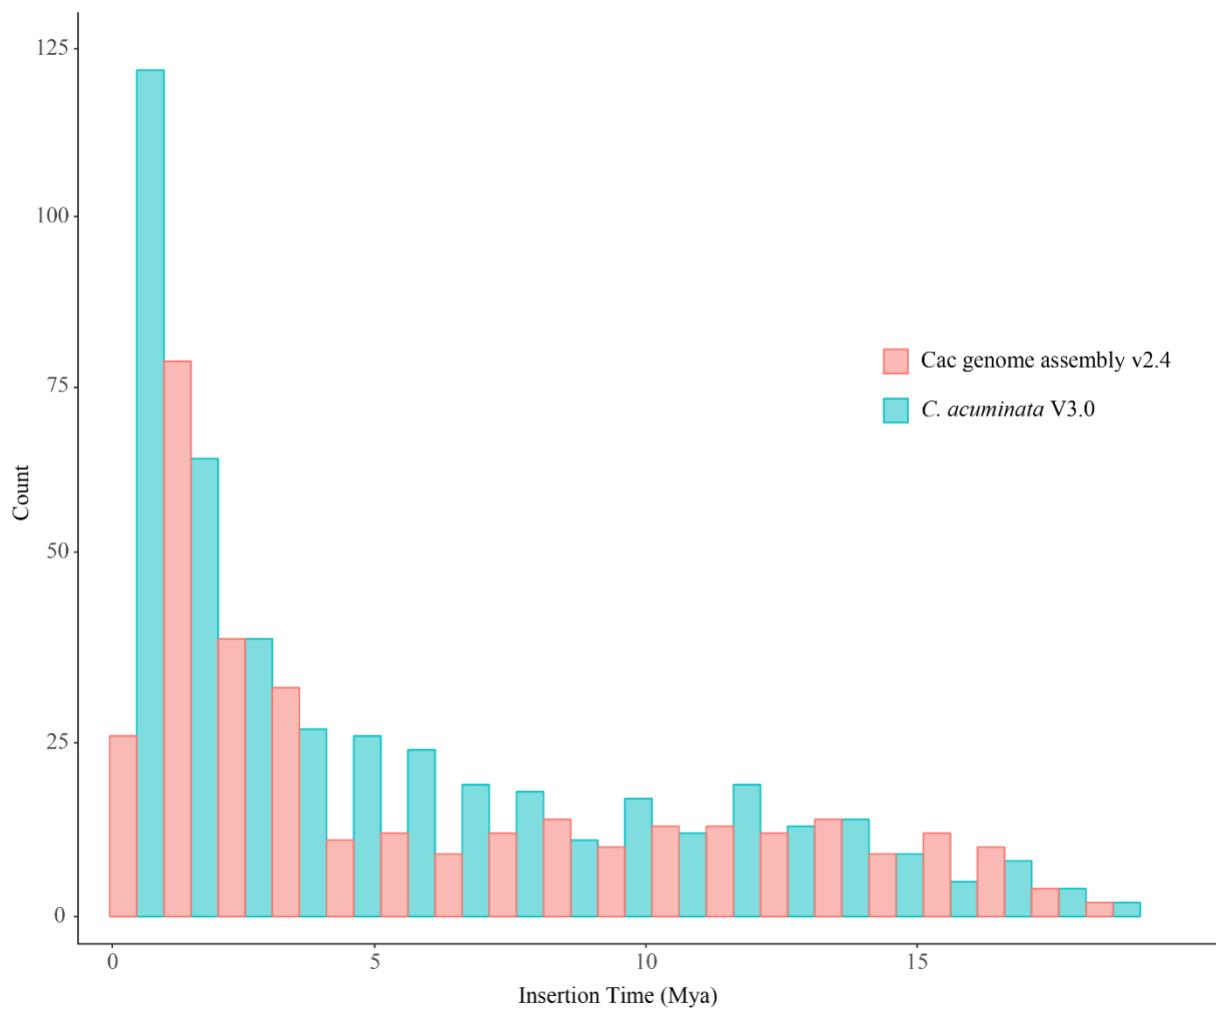

Supplementary Figure 1. Histogram of length distribution of raw *C. acuminata* PacBio subreads. Source data are provided as a Source data file.

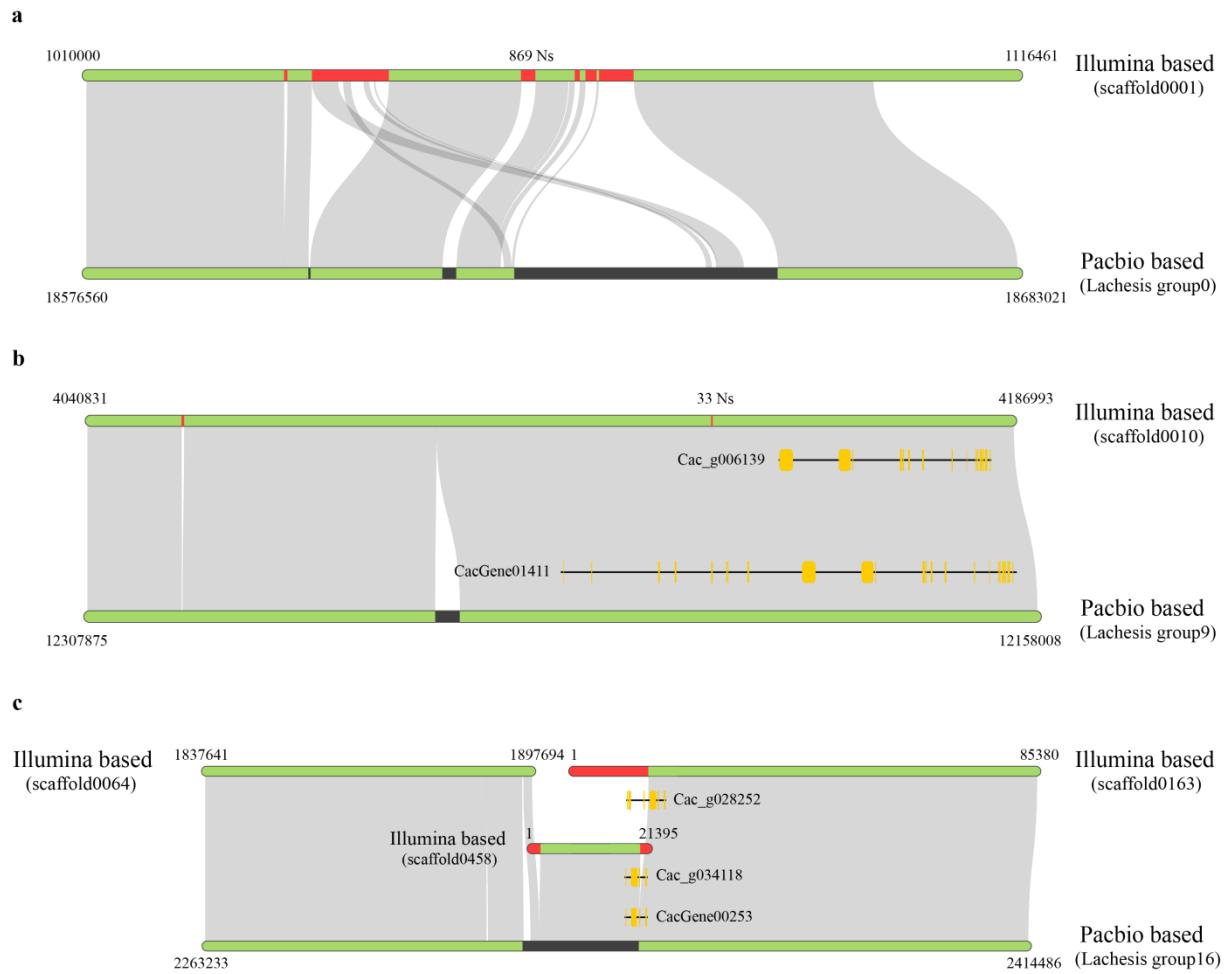

Supplementary Figure 2. Estimation of *C. acuminata* genome size by K-mer analysis. The figure shows the frequency of 17 k-mers, which are 17 bp sequences from clean reads of short-insert-size libraries. We identified 29,283,188,036 K-mers and the peak of K-mer depth is 71. Genome size can be estimated as (total K-mer number) / (the volume peak). The genome size of *C. acuminata* was thus estimated as 412.44 Mb, and the revised genome size is 404.95 Mb.

Supplementary Figure 3. Hi-C map of the *C. acuminata* genome showing genome-wide all-by-all interactions. The map shows a high resolution of individual chromosomes that are scaffolded and assembled independently.

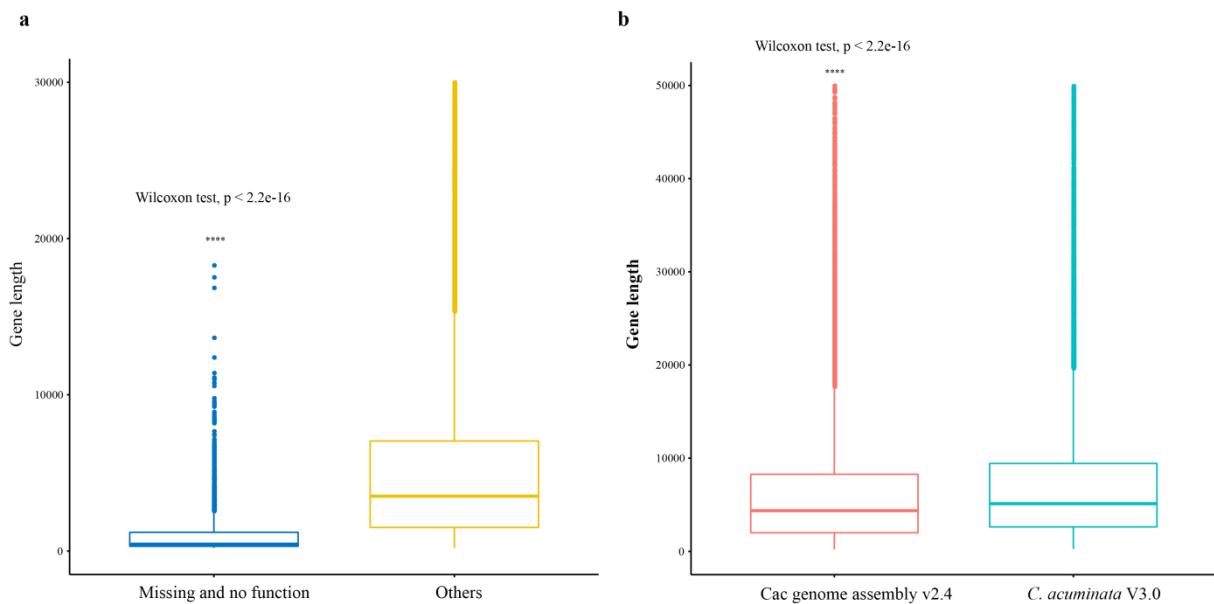

Supplementary Figure 4. The number of intact LTR-RTs birthed at different times (million years ago, Mya) in Cac genome assembly v2.4 and *C. acuminata* V3.0 genome. Source data are provided as a Source data file.

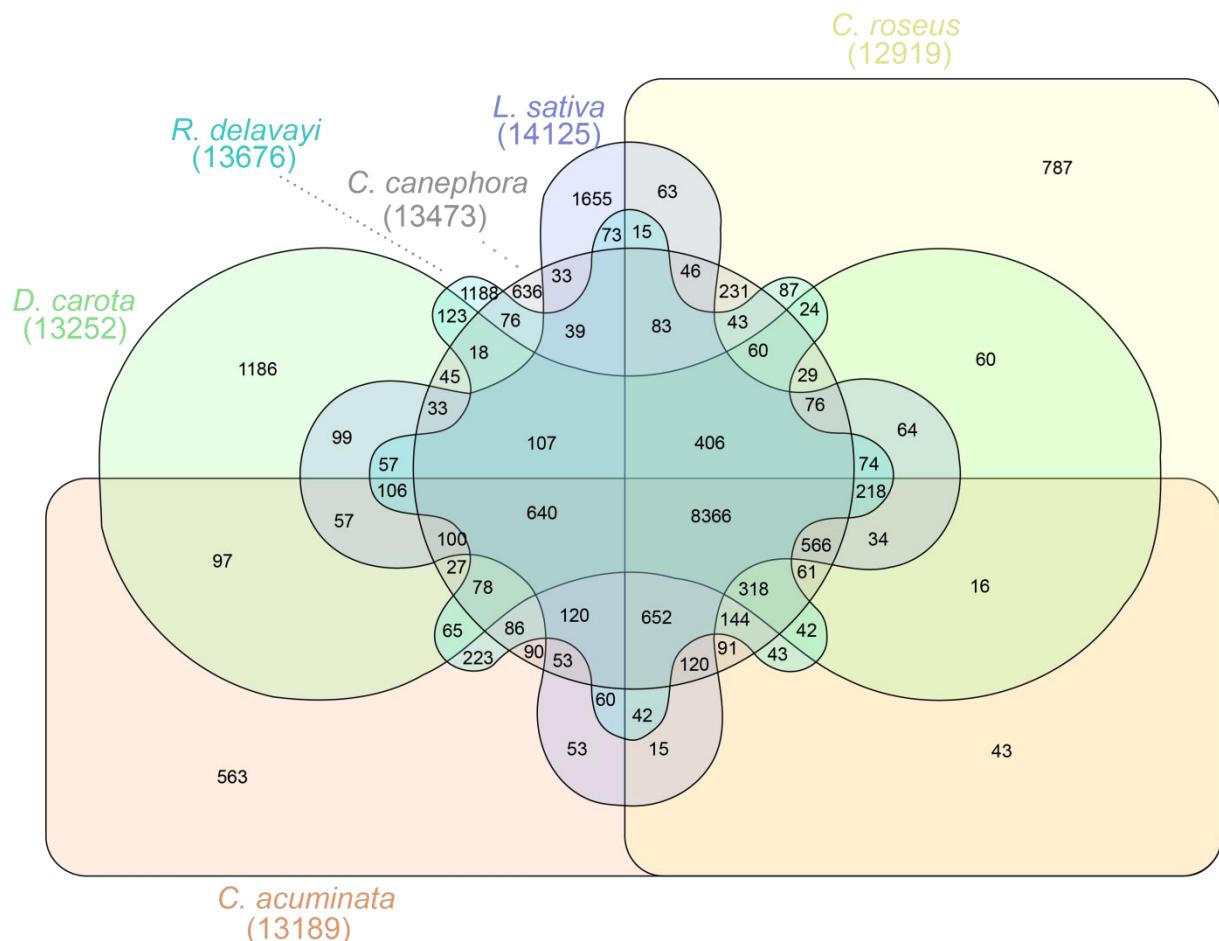

Supplementary Figure 5. Comparison of two *C. acuminata* genome assemblies. **a** Summary comparison of the Illumina-based and PacBio-based *C. acuminata* assemblies, showing the PacBio-based genome filled the gaps and correcting erroneous assembly (black) comparing with the Illumina-based sequences (red). **b-c** Comparison of the Illumina-based and PacBio-based *C. acuminata* assemblies, showing similar corrections that further lead to a correction in the protein-coding sequence prediction (yellow).

Supplementary Figure 7. Boxplot of protein-coding genes may have wrong structure annotation in Cac genome assembly v2.4 compare with *C. acuminata* V3.0. **a** Possible falsely annotated genes ($n = 2,273$) compare with other genes ($n = 29,588$) in Cac genome assembly v2.4 (significance tested by two-tailed Wilcoxon method with $W = 9359427$, p -value = $0 < 2.2e^{-16}$); **b** Possible partially annotated genes in Cac genome assembly v2.4 compare with their 1:1 ortholog genes in *C. acuminata* V3.0 (both $n = 18,116$, significance tested by two-tailed Wilcoxon method with $W = 181717587$, p -value = $3.959343e-70 < 2.2e^{-16}$). In **a-b** data are represented as boxplots where the middle line is the median, the lower and upper hinges correspond to the first and third quartiles, the upper whisker extends from the hinge to the largest value no further than $1.5 \times \text{IQR}$ from the hinge (where IQR is the inter-quartile range) and the lower whisker extends from the hinge to the smallest value at most $1.5 \times \text{IQR}$ of the hinge, while data beyond the end of the whiskers are outlying points that are plotted individually. Source data are provided as a Source data file.

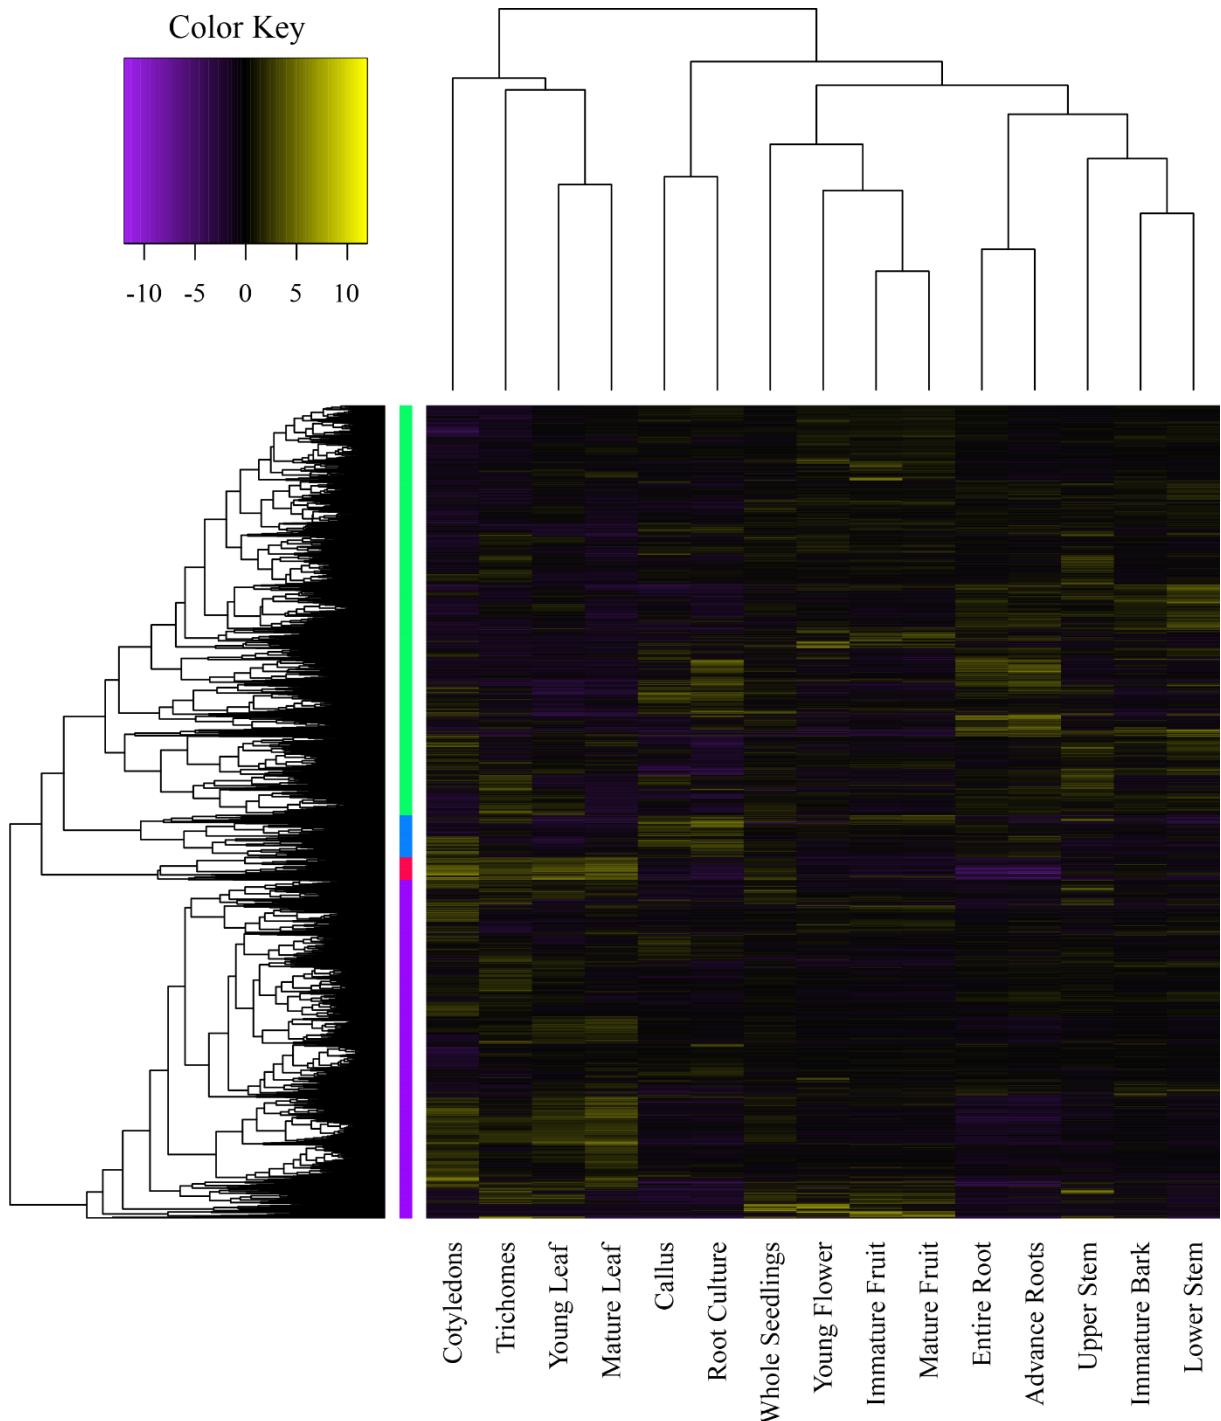

Supplementary Figure 8. Shared and unique gene families. Venn diagram representation of shared/unique gene families among *C. acuminata*, *R. delavayi*, *C. roseus*, *C. canephora*, *D. carota* and *L. sativa*. Only the numbers of gene families that have at least two members from either different species or the same species were shown here. Venn diagram generated by <http://www.interactivenn.net/>. Source data are provided as a Source data file.

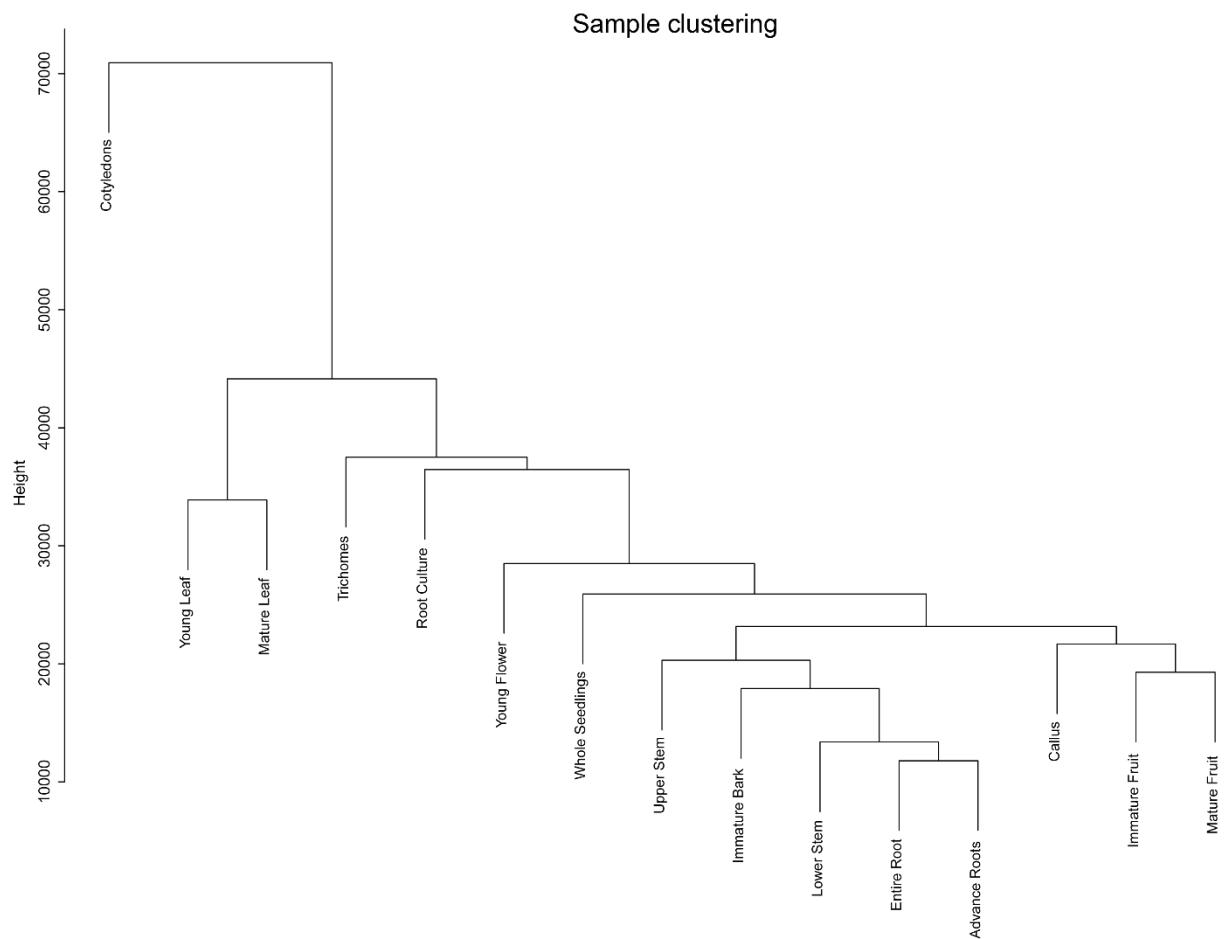

Supplementary Figure 9. Dot plot illustrating the comparative analysis of the *C. acuminata* and *V. vinifera* genomes. The red rectangles highlight several major duplication event, the dots represent the genome sequences' synteny detected by last v963.

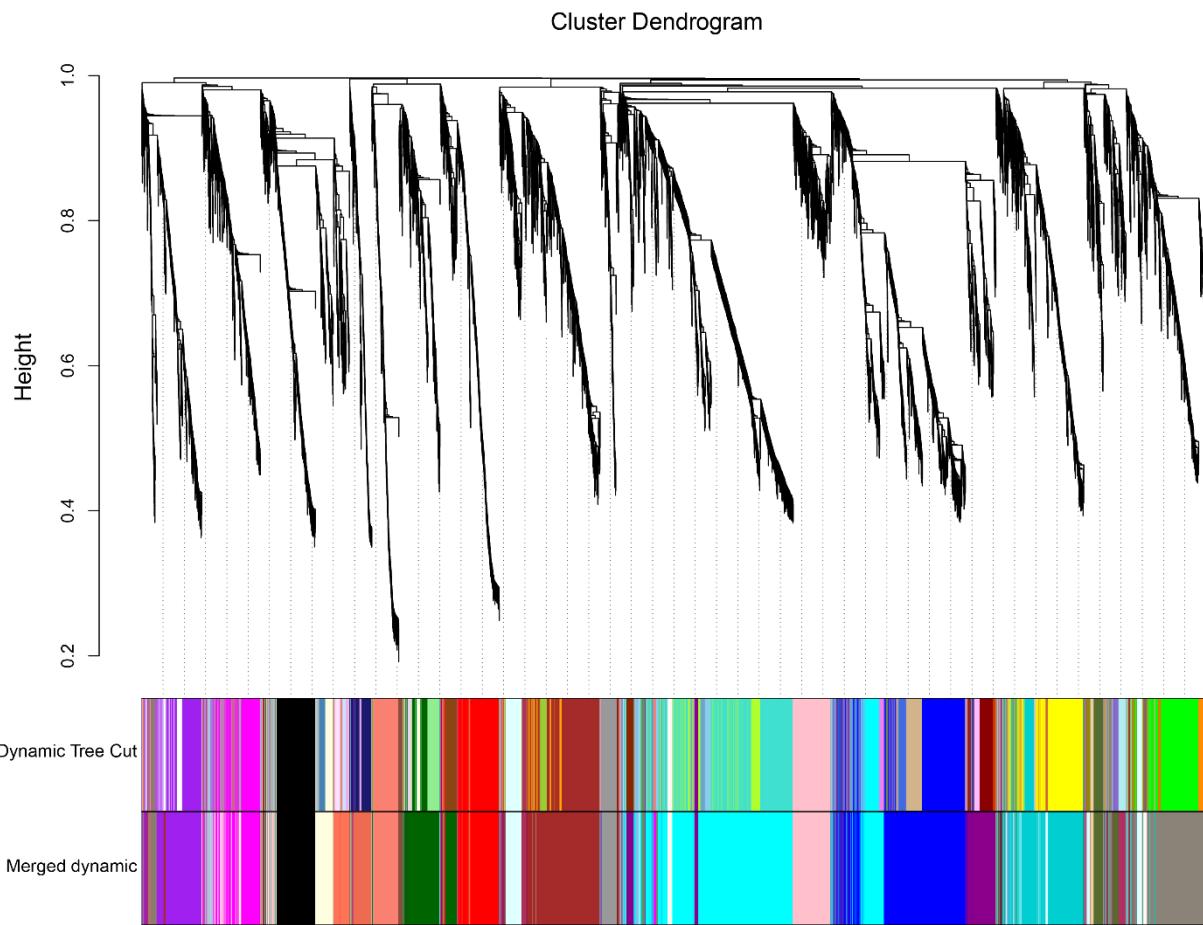

Supplementary Figure 10. Heat-map of differential expression among 15 tissues of *C. acuminata*.

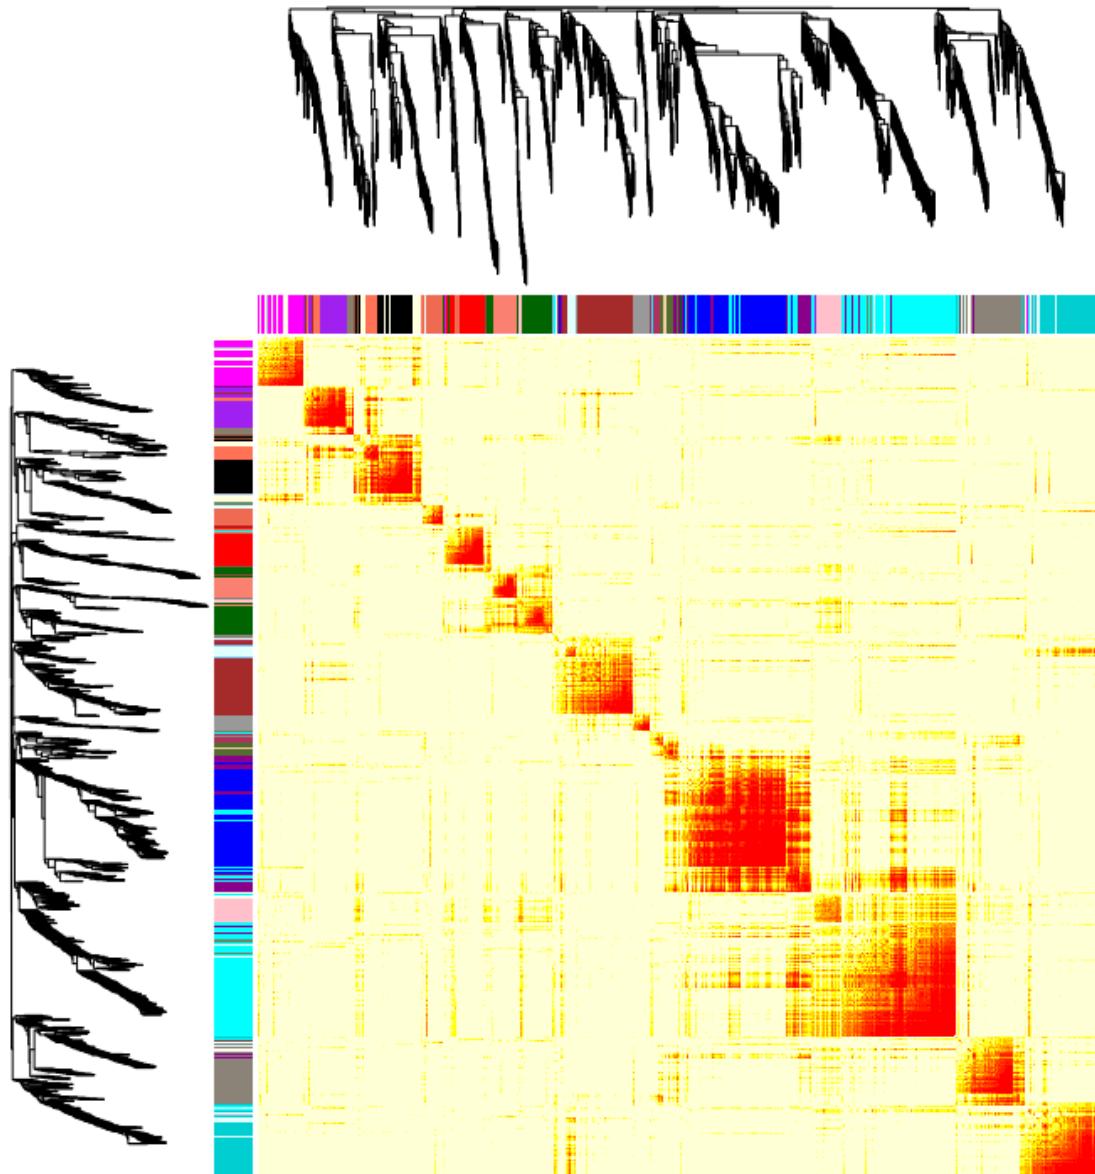

Supplementary Figure 11. Heat-map of differential expressed genes of *C. acuminata*.

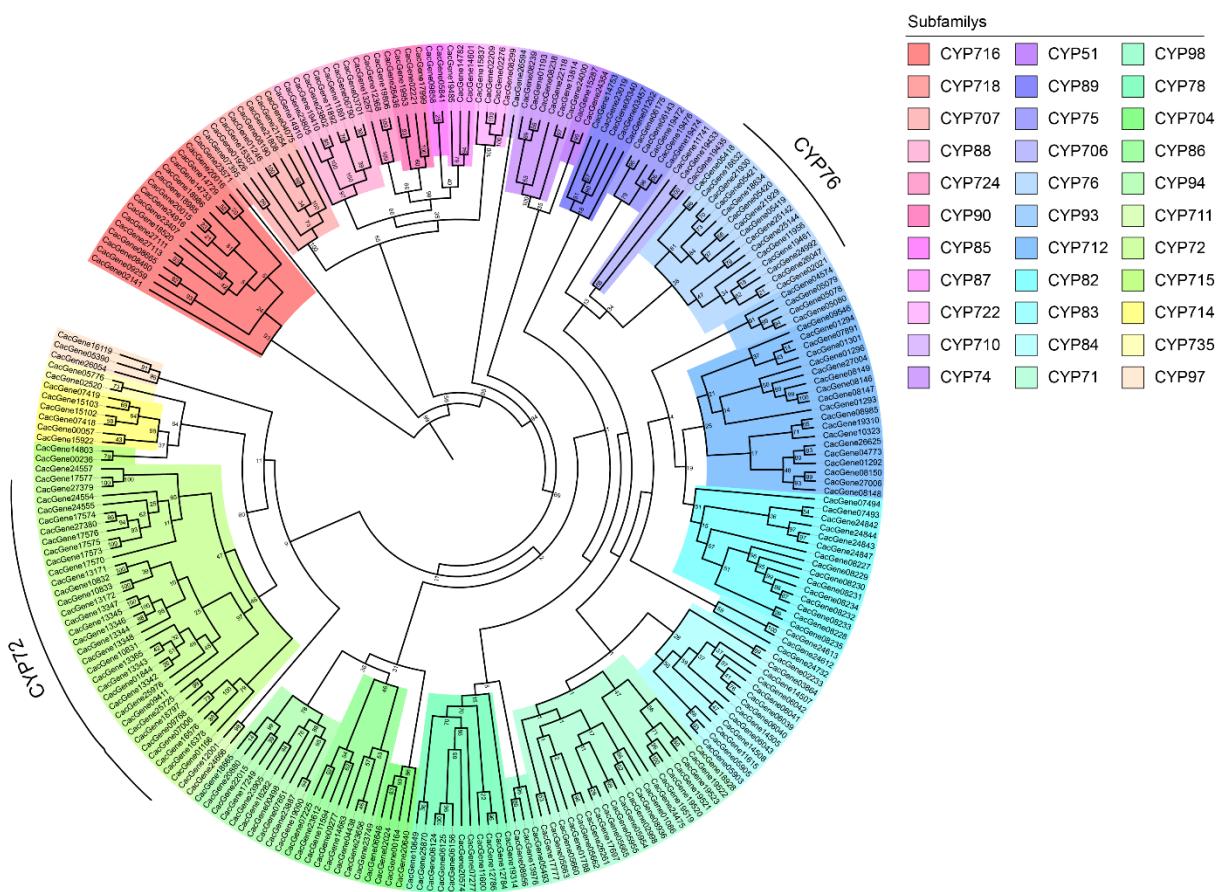

Supplementary Figure 12. Sample clustering for different tissues from WGCNA.

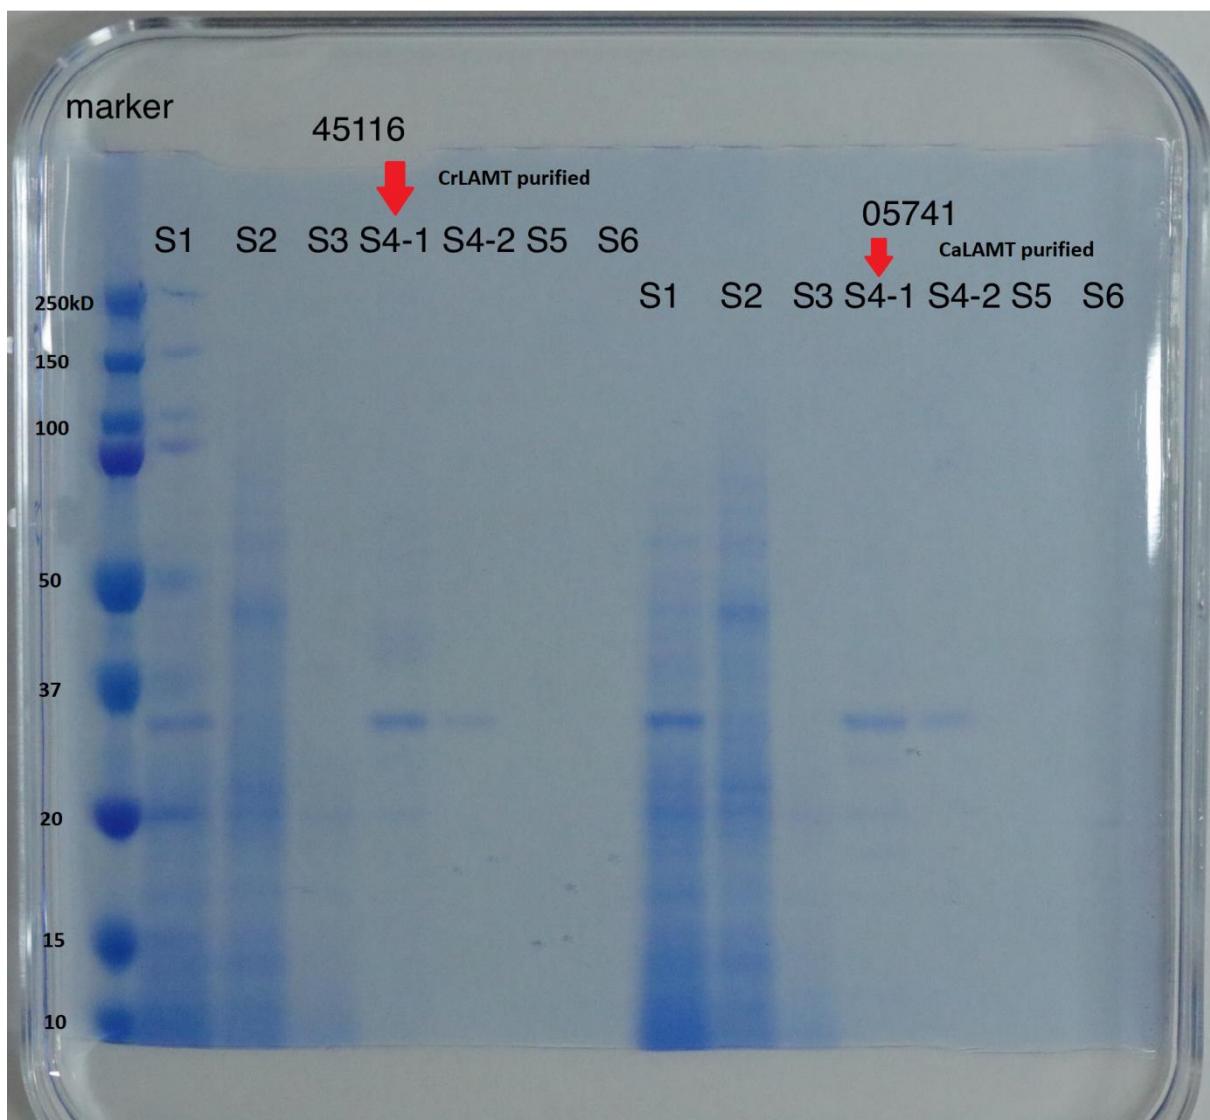

Supplementary Figure 13. Clustering dendrogram of differential expressed genes together with assigned merged module colours and the original module colours. The different colours under the dendrogram show co-expression modules identified using WGCNA. Some key genes in indole alkaloid biosynthetic pathway were assigned to the module with grey60 color.

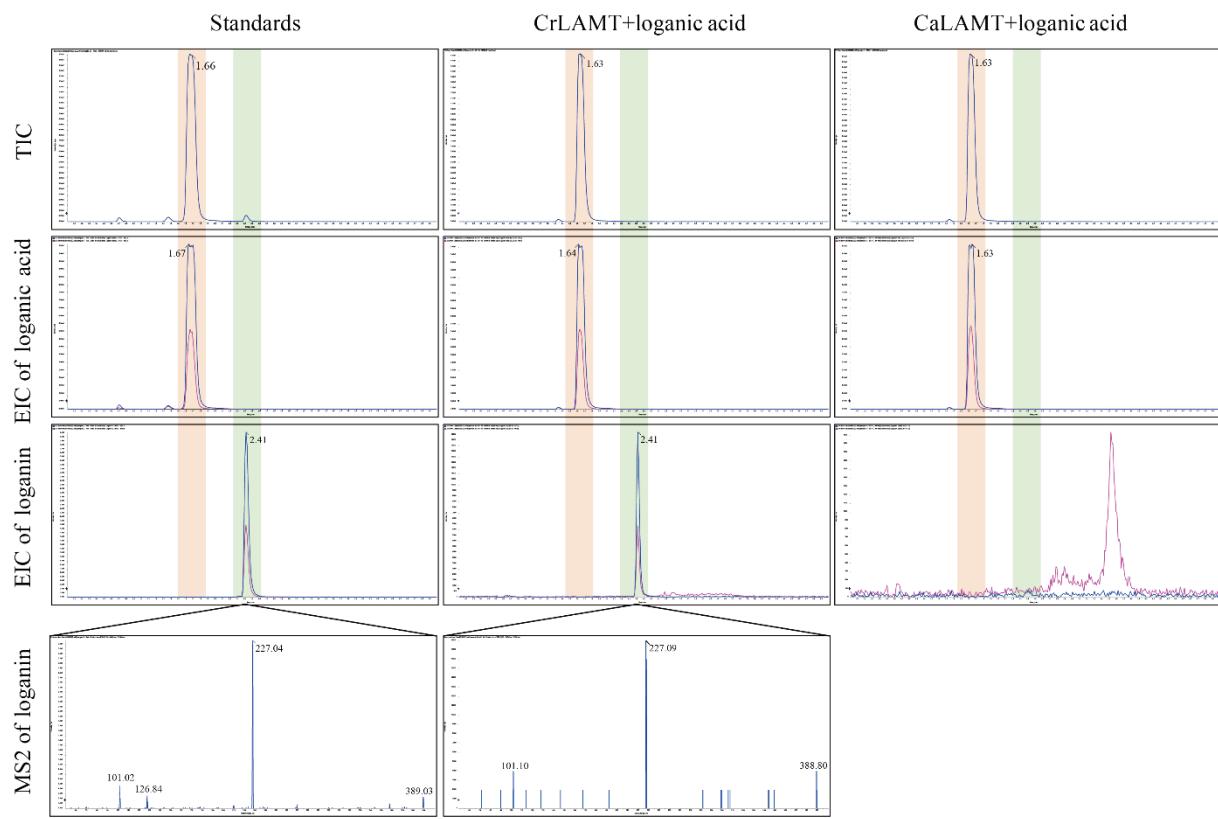

Supplementary Figure 14. Heatmap of the gene network using Topological Overlap Matrix among all differential expressed genes identified from different tissues. The left side and the top represent the gene dendrogram and module. The colour bar that next to the dendrogram shows the co-expressed modules.

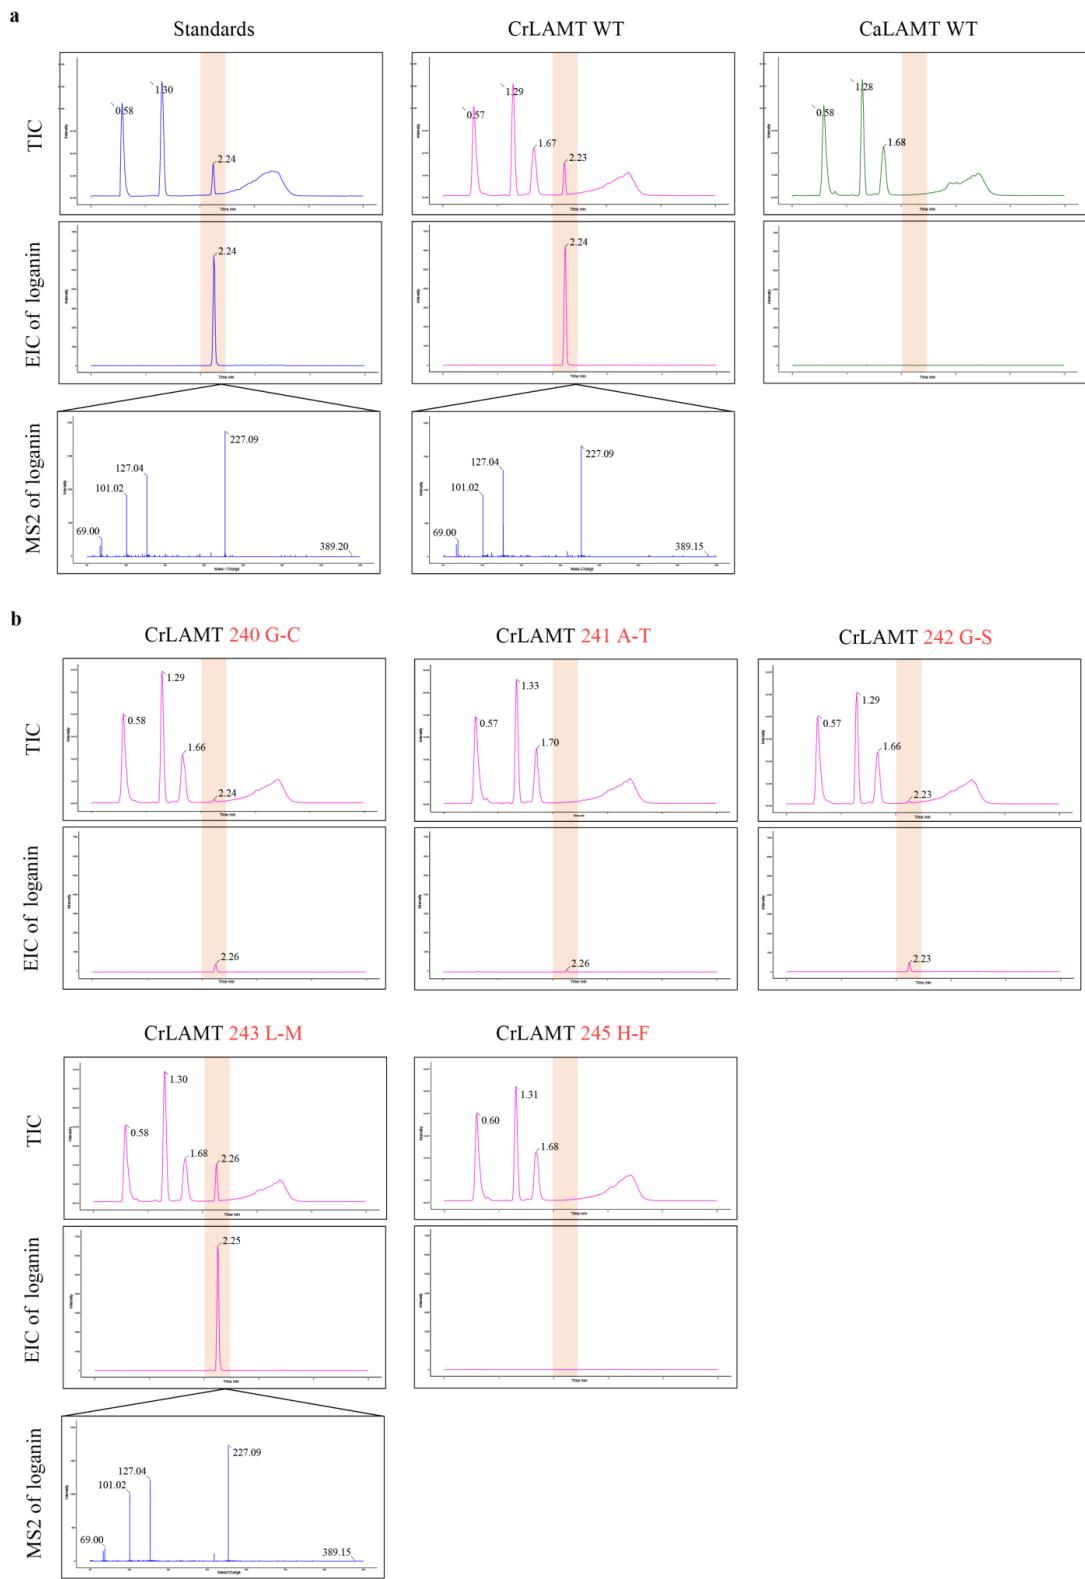

Supplementary Figure 15. Phylogenetic tree of the candidate CYP450 enzyme encoding genes identified in *C. acuminata* genome. Different colors indicate different CYP450 family members classified based on the protein domain annotation, homolog searching by *A. thaliana* and SwissProt protein database. Families which confirming involved in camptothecin biosynthesis previously were marked by arcs.

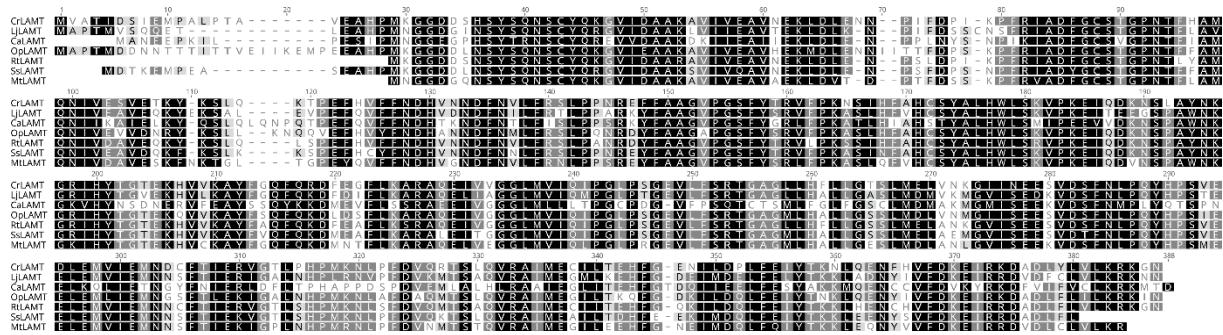

Supplementary Figure 16. SDS-PAGE of purified CrLAMT and CaLAMT. Line of the two purified proteins were highlighted by the red arrows. The experiment was repeated with similar results in line S4-1 and S4-2 respectively.

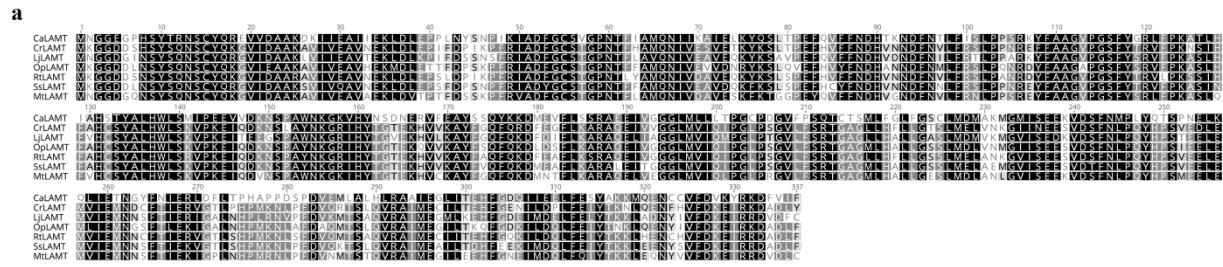

Supplementary Figure 17. Conversion reactions from loganic acid to loganin by CrLAMT and CaLAMT. TIC: Total Ion Chromatography, EIC: extracted ion chromatography. For MS2 model, the daughter ions of loganin (m/z , 389.2) was scanned between 50-400.

Supplementary Figure 18. Conversion reactions from loganic acid to loganin by CrLAMT WT, CaLAMT WT (**a**) and the CrLAMT mutants (**b**). TIC: Total Ion Chromatography, EIC: extracted ion chromatography. For MS2 model, the daughter ions of loganin (m/z , 389.2) was scanned between 50-400.

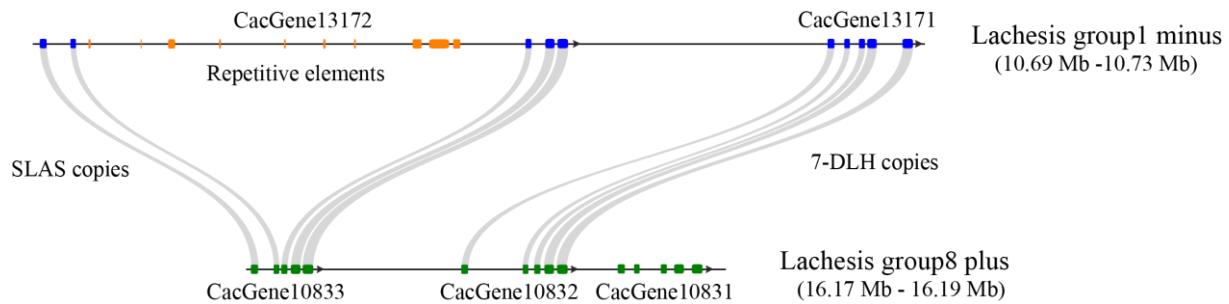

Supplementary Figure 19. Sequence alignment of LAMT encoding gene copies in *C. acuminata* and other species.

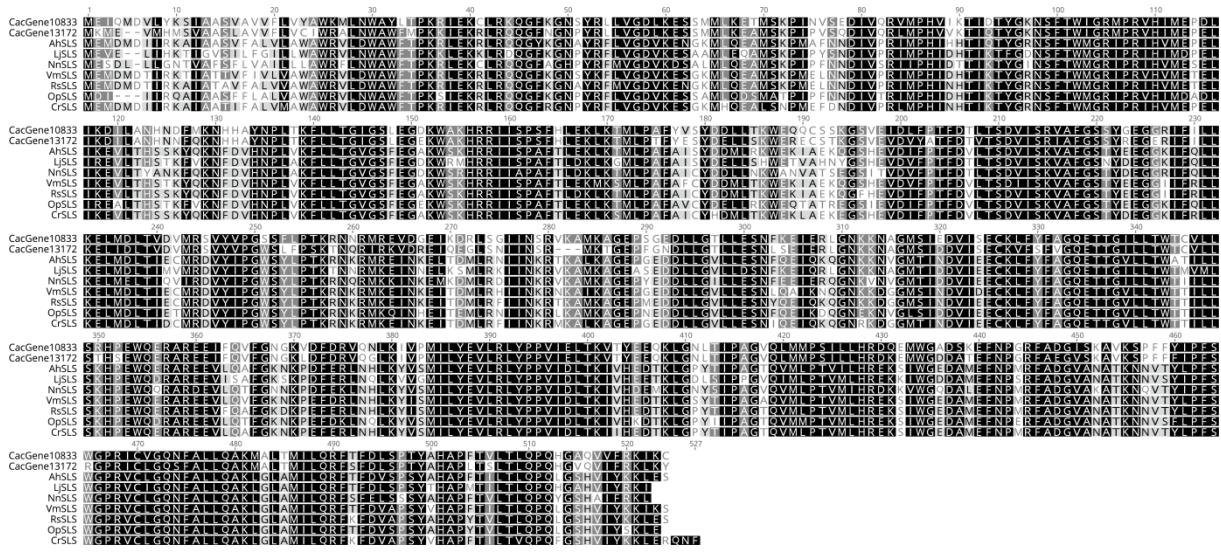

Supplementary Figure 20. Trimmed sequence alignment (a) and unrooted tree (b) used for selection analyses with LAMT encoding gene copies in *C. acuminata* and other species. Red indicate the foreground branches.

Supplementary Figure 21. Sequence alignment of SLAS CYP72A565 and CYP72A610 with their corresponding protein in *C. acuminata* genome assembly V3.0.

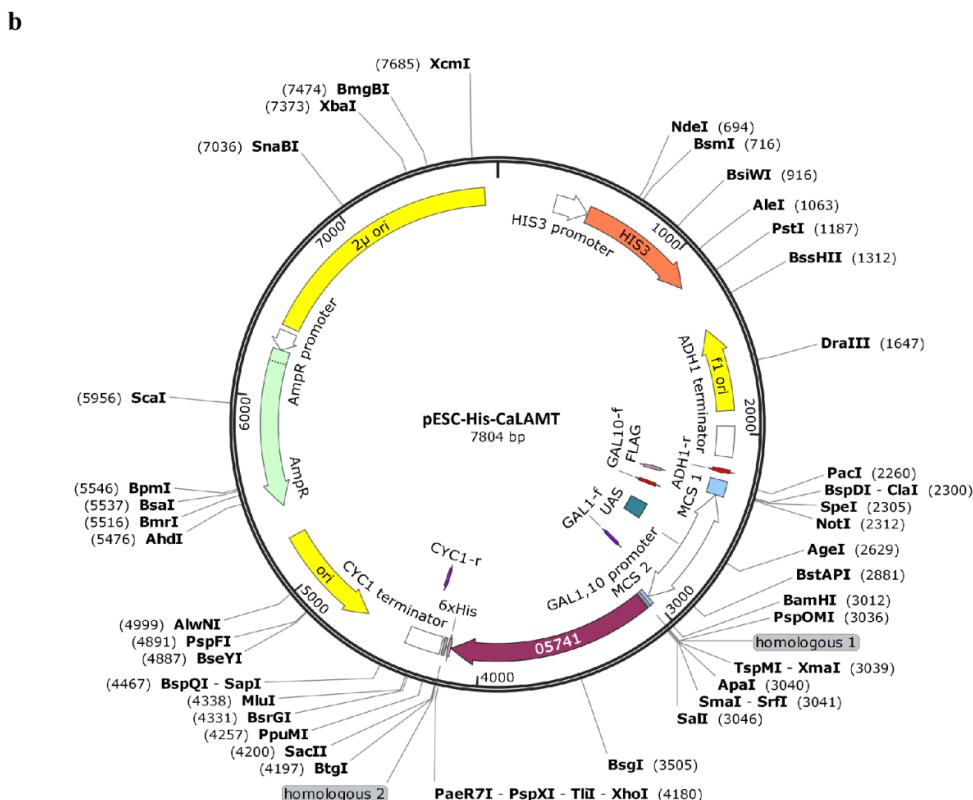

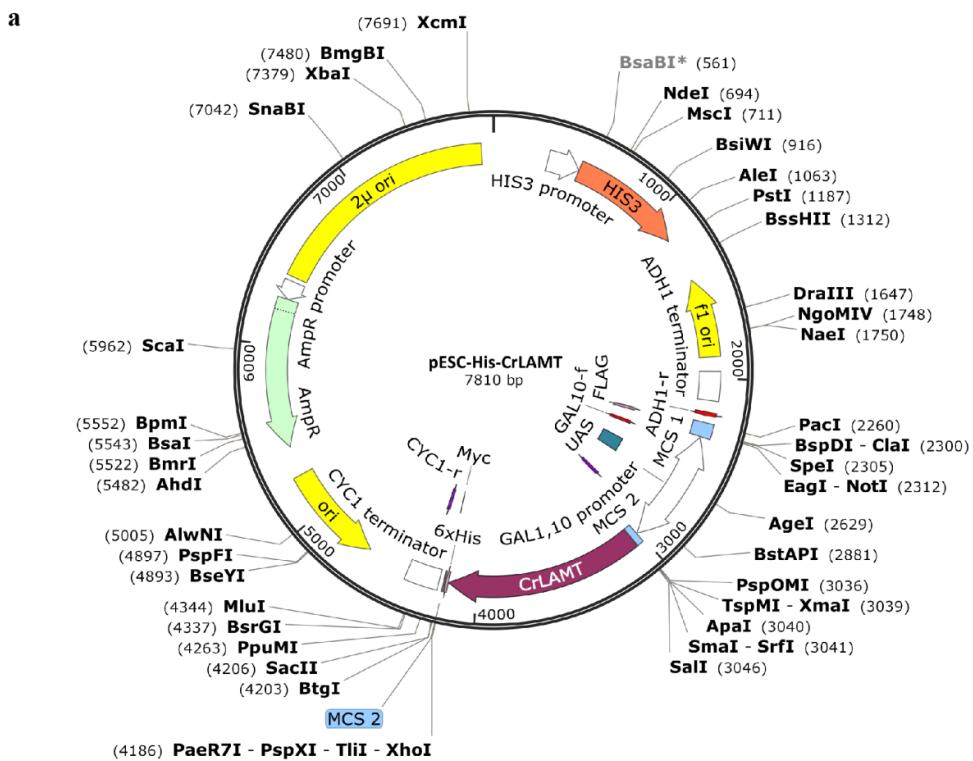

Supplementary Figure 22. Location and collinear relationship of 7-DLH and SLAS encoding gene copies in *C. acuminata* genome assembly V3.0.

Supplementary Figure 23. Sequence alignment of SLAS encoding gene copies in *C. acuminata* with SLS-like encoding genes in other species.

Supplementary Figure 24. Trimmed sequence alignment (**a**) and unrooted tree (**b**) used for selection analyses in SLAS encoding gene copies in *C. acuminata* and SLS-like encoding genes in other species. Red indicate the foreground branches. Positive sites were shown in blue.

Supplementary Figure 25. pESC-His expression vector with His tag of (a) CrLAMT and (b) CaLAMT.

Supplementary Table 1. Summary of DNA sequencing data.

Read type	Number of clean reads / subreads	Insert size (bp)	Total data (Gb)	Read length / Mean subread length (N50) (bp)	Sequence coverage (X) ¹
Illumina pair-end reads	158,859,043	350	47.66	2 x 150	118.18
Hi-C pair-end reads	197,679,512	300	59.30	2 x 150	146.45
Pacbio subreads	5,556,300	-	41.35	7,442 (10,334)	102.11

¹Depth was calculated under the estimate of a genome size of 404.95Mb.

Supplementary Table 2. Statistics of reads mapping rate and coverage of *C. acuminata* V3.0 genome assembly.

			Percentage (%)
Reads		Mapping rate	94.84
Genome	Coverage		95.71
	Coverage at least 4X		91.31
	Coverage at least 10X		86.62
	Coverage at least 20X		80.85

Supplementary Table 3. K-mer analysis of the *C. acuminata* V3.0 genome by using K-mer=17.

K-mer	K-mer number	K-mer depth (X)	Genome size (Mb)	Revised genome size (Mb)	Heterozygous ratio(%)	Repeat(%)
17	29,283,188,036	71	412.44	404.95	0.89	45.20

Supplementary Table 4. Statistics of *C. acuminata* V3.0 genome after assembly by Hi-C data.

Group	Sequence number ¹	Sequence length (bp) ¹

Total Sequences Ordered and Oriented (%)	376 (53.26)	393,985,980 (96.03)

¹Sequence number and length was calculated with all clustered sequences > 1 Kb.

Supplementary Table 5. Benchmarking Universal Single-Copy Orthologs (BUSCO) analysis about Cac genome assembly v2.4 and *C. acuminata* V3.0.

Total BUSCO groups searched	Complete single-copy BUSCOs	Complete duplicated BUSCOs	Fragmented BUSCOs	Missing BUSCOs	Complete BUSCOs percentage (%)
Cac genome assembly v2.4	1440	1244	104	36	56
<i>C. acuminata</i> V3.0	1440	1270	97	21	52

Supplementary Table 6. Intact LTR-RTs identified in Cac genome assembly v2.4 and *C. acuminata* V3.0.

Total intact LTR-RTs searched	Copia	Gypsy	Unknown
Cac genome assembly v2.4	340	180	65
<i>C. acuminata</i> V3.0	465	208	63

Source data are provided as a Source data file.

Supplementary Table 7. Classification of repetitive elements in the *C. acuminata* V3.0.

Type	Repeat size (bp)	number of elements	% of genome
DNA	28,477,637	114,478	6.86
LINE	19,209,794	41,079	4.63
SINE	1,114,895	7,584	0.27
LTR	56,029,493	74,750	13.50
Unclassified	50,997,452	214,155	12.29
Satellite	47,670	321	0.01
Simple repeats	494,387	2,623	0.12
Total interspersed repeats ¹	155,829,271	452,046	37.55
Total	156,371,328	454,990	37.68

¹Repetitive elements for masking genome for gene prediction, expect Satellite and Simple repeats. Because these type of repetitive elements are of short length, the probability of appearing in the coding region is high.

Supplementary Table 8. Comparison of predicted protein-coding genes between Cac genome assembly v2.4 and *C. acuminata* V3.0.

	Cac genome assembly v2.4	<i>C. acuminata</i> V3.0
Number of protein-coding gene	31,825	27,940
Number of transcripts	40,332	51,735
Average transcript length (bp)	6026.33	8394.99
Average exon length (bp)	286.32	269.81
Average intron length (bp)	1008.03	1052.31
Average number of exons per gene	5.07	6.14
Average exon length per gene (bp)	1450.68	1656.63

Supplementary Table 9. Summary of functional annotation of predicted genes for *C. acuminata* V3.0.

	Numbers of matching genes	Percent of annotated genes (%)
Total	27,940	100
SwissProt	22,121	79.17
InterPro	26,804	95.93
GO	24,691	88.38
TrEMBL	26,036	93.19
KEGG Pathway	9,320	33.36
Annotated ¹	27,122	97.07
Unannotated	818	2.93

¹At least one match in either of database above.

Supplementary Table 10. Summary of gene family clustering.

Species	Total genes	Genes in families	Family	Unclustered genes	Unique families	Genes per family
<i>A. thaliana</i>	27,416	23,178	12,561	4,238	825	1.85
<i>C. acuminata</i>	27,940	23,047	13,188	4,893	413	1.75
<i>C. roseus</i>	33,829	27,640	12,919	6,189	728	2.14
<i>C. canephora</i>	25,574	20,890	13,473	4,684	537	1.55
<i>D. carota</i>	32,113	26,088	13,252	6,025	1105	1.97
<i>L. sativa</i>	38,910	30,339	14,125	8,571	1593	2.15
