Figure E1 Legend. Selected Endoscopic Images Pre- and Post-Interventions. At baseline, the endoscopic activity is active, with exudates, rings, edema, and furrows (Ex2, R1, E1, F1, S0). There is non-response after six-food elimination diet (SFED) and a stricture is now noted (Ex1, R2, E1, F1, S9). After OVB, there is improvement in endoscopic appearance (Ex0, R1, E0, F0, S16), but when this was stopped and during the subcutaneous immunotherapy (SCIT) build-up phase there is a flare (Ex1, R1, E1, F1, S16). Finally after 8 months of maintenance SCIT and while off topical steroids, there is complete response (Ex0, R0, E0, F0, S0).
