## **Supplemental Figure Legend**

Supplementary Figure 1: Correlation of BMI with Visceral and Subcutaneous Fat in HIV-Associated NAFLD. A) In the overall sample, BMI loosely but significantly correlated with visceral fat (r = 0.29, P = 0.02). B) In contrast, BMI was strongly associated with subcutaneous fat (r = 0.86, P < 0.0001). Linear regression lines are shown with 95% confidence intervals.
