

BMJ Open

BMJ Open is committed to open peer review. As part of this commitment we make the peer review history of every article we publish publicly available.

When an article is published we post the peer reviewers' comments and the authors' responses online. We also post the versions of the paper that were used during peer review. These are the versions that the peer review comments apply to.

The versions of the paper that follow are the versions that were submitted during the peer review process. They are not the versions of record or the final published versions. They should not be cited or distributed as the published version of this manuscript.

BMJ Open is an open access journal and the full, final, typeset and author-corrected version of record of the manuscript is available on our site with no access controls, subscription charges or pay-per-view fees (<http://bmjopen.bmj.com>).

If you have any questions on BMJ Open's open peer review process please email info.bmjopen@bmj.com

BMJ Open

Areca nut use among the adult population in India: a nationally representative cross-sectional study

Journal:	<i>BMJ Open</i>
Manuscript ID	bmjopen-2020-043987
Article Type:	Original research
Date Submitted by the Author:	20-Aug-2020
Complete List of Authors:	Singh, Prashant Kumar; National Institute of Cancer Prevention and Research, Yadav, Amit Singh, Lucky; National Institute of Medical Statistics Mazumdar, Sumit; Centre for Health Economics Sinha, Dharendra ; South-East Regional Office, World Health Organisation, WHO FCTC Global Hub on Smokeless Tobacco Straif, Kurt; International Agency for Research on Cancer Singh, Shalini; Indian Council of Medical Research

3 **Areca nut use among the adult population in India: a nationally representative cross-**
4 **sectional study**
5

6
7 **Abstract**
8

9
10 **Objective:** Areca nut is one of the widely consumed substance abuse globally, after nicotine,
11 ethanol and caffeine and classified as carcinogenic to humans. This study examines the disparity
12 and determinants of areca nut use with and without tobacco in India.
13
14
15

16
17 **Design:** Nationally representative cross-sectional study.
18

19
20 **Participants:** We utilized nationally representative Global Adult Tobacco Survey (GATS) 2016-
21 17. The analytical sample size was 74,037 individual's aged 15 years and above.
22
23
24

25 **Measures:** Current use of areca nut without tobacco and with tobacco.
26
27

28 **Method:** We examined determinants of areca nut consumption (without tobacco and with
29 tobacco) using multinomial logistic regression, accounting for complex survey design.
30
31
32

33 **Results:** Finding shows 23.9% (95%CI 23.1-24.8) adult population consume areca nut, which
34 accounts for approximately 223.79 million users in India. Out of total areca nut users, 9.7%
35 (95%CI 9.1-10.4) users consumed areca nut with tobacco. When compared to females, males
36 were more prone to consume areca nut without tobacco (RR=1.13;95%CI 1.07-1.20) and with
37 tobacco (RR=2.02; 95%CI 1.85-2.21). Age, marital status, education, occupation, caste, religion
38 and region were significantly associated with areca nut use. However, the direction of
39 association differs with respect to the use of areca nut with tobacco and without tobacco.
40
41
42
43
44
45
46
47
48

49 **Conclusion:** Areca nut is not explicitly covered by the WHO Framework Convention on
50 Tobacco Control. The ongoing tobacco control efforts would not yield the desired outcome until
51 greater attention to areca nut use is reflected in the formulated health policies in the country.

9 **Strength and Limitations of this study**
10

- 11
- 12 • Despite growing scientific evidence of high addictiveness and several ill effects
13 associated with areca nut use, research on areca nut has not received much attention.
14
 - 15 • Using nationally representative survey, our analysis show nearly one-fourth adult
16 population (223.79 million) adults consume areca nut in India, with higher use among
17 adult men than women.
18
 - 19 • Considerbale regional variation exists with four states namely Uttar Pradesh (49.9
20 million), Maharashtra (26.7 million), Karnataka (19.8 million) and Tamil Nadu (17.7
21 million) accounts for half of the areca nut users in the country.
22
 - 23 • Age, sex, education, occupation, social group and regious affiliation significantly
24 determines areca nut use in the country.
25
 - 26 • Study is based on 15 years and older population, whereas the areca nut habits often start
27 at younger age.

Authors' contribution

PKS conceived the study. PKS and LS performed statistical analysis. PKS, LS and AY analyzed and interpreted the data. PKS and AY drafted the manuscript. SM, DN, KS and SS provided comments and contributed to the development of the final draft of the manuscript. All authors have supervised and approved the manuscript.

Data sharing statement

Data utilized by the study is available by emailing prashants.geo@gmail.com.

Introduction

Areca nut is one of the widely consumed substance abuse globally, after nicotine, ethanol and caffeine[1,2]. Owing to its addictive properties, areca nut is estimated to be consumed by hundreds of millions of people across various countries [3]. However, addiction to areca nut is largely prevalent in many Asia-Pacific countries and by emigrants from these countries in other parts of world. In countries such as mainland China, Taiwan, areca nut has been used in other preparations as well [3].

The International Agency for Cancer Research (IARC) classified areca nut use with or without tobacco as carcinogenic to humans[4]. A meta analysis found that areca nut use with tobacco (Relative Risk 7.03; 95%CI, 4.68–10.56) and areca nut use without tobacco (Relative Risk 3.22; 95%CI, 2.11–4.92) cause cancer of oral cavity in Indian subcontinent[5]. Furthermore, studies have documented that areca nut use adversely affects all organs of the human body[1,6]. Studies also found that areca nut use has been associated with dependence in users [7] and withdrawal effects with high severity of dependence [8] similar to those observed for nicotine dependence [8]. Children in their early age typically begin chewing habits with different kinds of areca nut product[9].

Despite growing scientific evidence of high addictiveness and several ill effects associated with areca nut use, research on areca nut has not received much attention[3]. The large global and national movement that addresses tobacco control under the ambit of the WHO Framework Convention on Tobacco Control (FCTC) has focused primarily on smoking and has been less effective in controlling SLT[10]. Tobacco control policies, though, applicable to areca nut products containing tobacco, considerable number of people consume areca nut without tobacco, which poses greater public health challenges in controlling and regulating the substance [11].

Existing studies on areca nut lack representativeness. We searched PubMed for articles with no language restrictions from all time to 20 March 2020, using the search terms ["disparity" OR "determinant" OR "factor"] AND ["areca nut" OR "betel nut" OR "supari" OR "suppari" OR "supaari" OR "betel quid"] AND ["India"] to review published and peer-reviewed literature. All existing studies that we identified were restricted to a specific geographical area or population groups in India and none of them were nationally representative. None of the existing studies have examined diverse habits of areca nut use, its disparity and determinants using nationally representative survey. A recent global review calls for more research to understand the epidemiology of areca nut use across different populations and geographies [3].

While India's share to overall areca nut production and consumption remains at the top, no attempts have been made to explore the patterns and determinants of the use of areca nut based on large scale representative surveys. This study aims to examine the disparity and determinants of areca nut use, with and without tobacco using nationally-representative Global Adult Tobacco Survey (GATS) conducted in 2016-17.

Methods and materials

Study Design and Participants

We utilized nationally representative cross-sectional Global Adult Tobacco Survey (GATS) 2016-17, conducted in all 29 states and three Union Territories (UTs) of India [12]. The study included whole GATS sample of 74,037 adults aged 15 and above. A multi-stage sampling design separately for rural and urban areas was adopted to draw a representative sample considering the 2011 census population figures. The household and individual response rate was 93%. Further details related to survey methodology, sampling design, household and individual

1
2
3 selection, data collection, management and monitoring procedures have been described
4
5 elsewhere[12].
6
7

8 ***Dependent variables*** 9

10
11 The outcome variable was current use of areca nut use, assessed based on following questions
12
13 covered in the GATS:
14
15

- 16 1. Do you consume *pan masala* without tobacco?
- 17 2. Do you consume betel quid without tobacco?
- 18 3. Do you consume areca nut of any type, plain, powdered or flavoured?
- 19 4. On average, how many times a day do you use the following products? Also, let me know
20
21 if you use the product, but not every day – Betel quid with tobacco?
- 22 5. On average, how many times a day do you use the following products? Also, let me know
23
24 if you use the product, but not every day – *Gutka*, areca nut-tobacco lime mixture, or
25
26 *mawa*?
- 27 6. On average, how many times a day do you use the following products? Also, let me know
28
29 if you use the product, but not every day – *Pan masala* with tobacco?
30
31
32
33
34
35
36
37
38
39

40 Based on the above-mentioned questions asked in GATS, we constructed three sets of
41
42 variables: (i) areca nut use without tobacco, (ii) areca nut use with tobacco and (iii) areca nut use
43
44 with and without tobacco. Definition of specific products can be found with the GATS 2 national
45
46 report[13].
47
48

- 49 (i) Areca nut use without only tobacco includes
50
51 a. *Pan masala* without tobacco
52
53 b. Betel quid without tobacco
54
55
56
57
58
59
60

- 1
- 2
- 3 c. Areca nut of any type
- 4
- 5 (ii) Areca nut use with only tobacco includes
- 6
- 7 a. *Gutka*, areca nut-tobacco lime mixture, or *mawa*
- 8
- 9
- 10 b. *Pan masala* with tobacco
- 11
- 12 c. Betel quid with tobacco
- 13
- 14 (iii) Both forms - Areca nut use with and without tobacco at the same time.
- 15
- 16 (iv) Any form –who uses any of these products
- 17
- 18
- 19

20 ***Independent variables***

21
22 A range of socioeconomic, demographic, awareness related and contextual level variables
23 included in this study[14–18]. These variables include age (categorized as 15-18, 19-23, 24-30,
24 31-40, 41-50, 51-60 and 60+) and sex as male and female. Individual's education was measured
25 as: (i) no education, (ii) below than primary, (iii) primary completed, (iv) below than secondary,
26 (v) secondary completed, (vi) completed higher secondary, (vii) completed college/university
27 and (viii) completed post-graduate level. Individual's occupation on the other side was assessed
28 based on self-reported information as (i) student, (ii) government sector, (iii) non-government
29 sector, (iv) casual/ daily labourer, (v) self-employed, (vi) homemaker, (vii) retired and (viii)
30 unemployed.

31
32 A wealth index was calculated based on availability of electricity, flush toilet, radio, television,
33 fixed telephone or cell phone, refrigerator, washing machine, moped/scooter/motorcycle and car
34 using PCA (Principle Component Analysis) methodology[19]. Individual's were divided into
35 five wealth quintiles based on their household score ranges from 1 being poorest to 5 being
36 wealthiest, with each category representing 20 percent of the score [19].

37
38 A composite knowledge variable which measures the poor health impact of smokeless tobacco

1
2
3 use was constructed based considering following information asked in the survey: smokeless
4 tobacco causes serious illness (yes/no), smokeless tobacco cause oral cancer (yes/no), smokeless
5 tobacco cause dental diseases (yes/no), smokeless tobacco cause harm to fetus during pregnancy
6 (yes/no), and do you think tobacco leads to addiction (yes/no). The new knowledge variable
7 categorised as: (i) 'no, to all five awareness' (ii) 'no, to at least one awareness' and (iii) 'yes, to
8 all five awareness'. Social (caste) group was categorised based on individual's self-reporting as
9 Scheduled Castes (SCs), Scheduled Tribes (STs), Other Backward Classes (OBCs) and others.
10 These broad categorization of social group is based on their socioeconomic disadvantage in
11 education, health, nutrition, employment by federal government. Religion captures self-reported
12 follower/believer of Hinduism, Islam, Christianity and others (which mainly include Sikhs, Jains,
13 Buddhists and non-believers). Study also considered place of residence as rural and urban as well
14 as all 29 states and three UTs in the analysis.

31 *Analytical Strategy*

32
33
34 At first, prevalence of areca nut consumption with and without tobacco at national and sub-
35 national levels along with rural-urban and male-female differences was shown. χ^2 tests were
36 performed to examine the differences in prevalence of areca nut use with all independent
37 variables. To examine the associated between areca nut use with various socioeconomic and
38 demographic characteristics, multinomial logistic regression was used. In the multinomial logit
39 regression, it is assumed that log odds of outcome/dependent variable either follow linear form
40 or non-binary form; and each outcome/dependent variable is modelled relative to the baseline
41 group or outcome[20]. In this study, instead of binomial we have considered (i) 'non-areca nut
42 user (baseline group)', (ii) 'areca nut use with tobacco', (iii) 'areca nut use without tobacco' and
43 lastly (iv) 'dual user'. The study reported the relative risk ratio (RR) along with 95% confidence
44
45
46
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 intervals [21]. We calculated the population burden based on GATS weighted sample population
4
5 figures, which were provided in the GATS India report. Appropriate adjustment for sampling
6
7 weights was considered during the analysis using STATA 15 version [22].
8
9

10 ***Ethics statement***

11
12
13 The second round of GATS obtained ethical clearance from the Ethics Committee of Tata
14
15 Institute of Social Sciences[13]. No ethics clearance was required for this study, as we used
16
17 secondary analysis using publicly available data.
18
19

20 ***Patient and public involvement***

21
22
23 No patients were involved in the development of the research question or the outcome measures
24
25 nor the design of the study.
26
27

28 **Results**

29 ***Descriptive statistics***

30
31
32 Of the 74037 sample, 40265 (48.9%) were women and 33772 (51.1%) were men, and 47549
33
34 (65.5%) individuals were resided in rural areas. One out of four respondents were illiterate and
35
36 nearly 78% were aware about the adverse health effects of SLT use (Supplementary table 1).
37
38

39
40
41 We found that overall, betel quid without tobacco (8.7%; 95%CI 6.7-10.2) was consumed
42
43 largely, followed by areca nut of any type (8%; 95%CI 5.9-10.3) at the national level (Table 1).
44
45

46
47 Among men, the prevalence of *gutka*, areca nut-tobacco lime mixture or *mawa* was consumed
48
49 the most (17.8%; 95%CI 15.1-20.2), whereas, among women, betel quid without tobacco was
50
51 largely consumed (9.0%; 95%CI 6.1-11.9). In urban areas, both betel quid without tobacco and
52
53 areca nut of any type were largely consumed, while in the rural areas it was mainly betel quid
54
55 without tobacco. Regional pattern suggests that betel quid with tobacco were predominately
56
57
58
59
60

1
2
3 consumed in many north-eastern states, while betel quid without tobacco was mainly used in
4
5 south (Supplementary table 2).
6
7

8 ***Regional and socioeconomic disparity in areca nut*** 9

10
11 We found 23.9 (95%CI 23.1-24.8) adults were consuming areca nut at national level and out of
12
13 this 14.2% (95%CI 13.6-14.9) were consuming without tobacco (Table 2). Areca nut use
14
15 without tobacco was largely being consumed across north-eastern states, apart from other bigger
16
17 states like Karnataka (28.8%; 95%CI 25.6-32.1), Tamil Nadu (25.5%; 95%CI 21.9-29.5) and
18
19 Maharashtra (20%; 95%CI 17.0-22.5). Nearly 223.4 million people out of total 932,488,000
20
21 population aged 15 and above consume areca nut in India (Table 3). The distribution of areca nut
22
23 user both in terms of population and proportion across states were as follows: Uttar Pradesh with
24
25 49.9 million users contributes to nearly 22% of all areca nut users, followed by Maharashtra with
26
27 26.7 million users (12%), Karnataka with 19.8 million (9%) and Tamil Nadu with 17.7 million
28
29 users (8%). Together, these four states share nearly 51% of all areca nut users in the country. Not
30
31 much difference exists between urban and rural areas in areca nut usage patterns (Supplementary
32
33 table 3). In 18 states/UTs, however, areca nut use was higher in urban areas than rural
34
35 counterparts. In 13 states/UTs, the opposite pattern was evident. Consumption of areca nut in any
36
37 form was higher among males as compared to females both at national level as well as in
38
39 majority of states (Supplementary table 4).
40
41
42
43
44
45

46 All forms of areca nut use was higher in the age group 31-50 years (Table 4). 28.8% men
47
48 (95%CI 27.7-30.0) and 27.1% widowed/separated/divorced (95%CI 25.3-29.1) were consuming
49
50 areca nut. Individuals who had completed below the primary level of schooling consumed higher
51
52 proportion of areca nut. Areca nut use was highest among daily wage labourers (30.2%; 95%CI
53
54
55
56
57
58
59
60

1
2
3 28.7-31.7). We found that STs (25.6%; 95%CI 23.0-27.5) and Muslims (30.8%; 95%CI 28.4-
4
5 33.2) were consuming higher rates of areca nut.
6
7

8 ***Determinants of areca nut use***

9

10
11 Regression results suggest that the likelihood of areca nut use in both forms were positively
12 associated with increase in age (Table 5), except that areca nut use without tobacco was lower
13 among the age group 51 and above, as compared to the 15-18 age groups. Probability of areca
14 nut use was higher among males as compared to females in all three forms. The likelihood of
15 areca nut use without tobacco was higher across all the educational categories as compared to
16 illiterate. However, areca nut with tobacco and dual-use was declining with increase in
17 education. The likelihood of areca nut use with tobacco and dual-use was significantly higher
18 among SCs than other social groups. Probability of all the three forms of areca nut use was
19 higher among Muslims as compared to Hindus.
20
21
22
23
24
25
26
27
28
29
30
31

32 **Discussion**

33

34
35 The findings of the study revealed that nearly one out of every four adults in India consumes
36 areca nut, that is, almost 223.79 million people, making areca nut a much bigger public health
37 challenge in dealing with substance abuse and addiction in the country. Moreover, nearly 10%
38 consumed areca nut with tobacco. Thus, considering the wide range of adverse health impacts,
39 effective implementation on banning of tobacco as an ingredient with areca nut products under
40 regulation 2.3.4 of the Food Safety and Standards Regulation, 2011 and ban on manufacture and
41 sale of areca nut products, as implemented in some of the states, is urgently needed [1].
42
43
44
45
46
47
48
49
50

51 We found considerable regional and socioeconomic differences in the use of areca nut. In four
52 states, Meghalaya, Assam, Mizoram and Manipur, over half of the population consume areca
53
54
55
56
57
58
59

1
2
3 nut. Further, Karnataka, Uttar Pradesh, Tamil Nadu, Maharashtra and Odisha, constitute nearly
4
5 55% of the country's areca nut users. As far as other SES determinants are concerned, the
6
7 findings confirmed age, gender, marital status, education, occupation, social group and religion
8
9 are significantly associated with areca nut use. However, the direction of association differs with
10
11 respect to areca nut use with and without tobacco.
12
13

14
15 We found protective effect of secondary and above level education in the case of areca nut use
16
17 with tobacco and in both forms. A study from Pakistan also observed that the use of areca nut
18
19 users increased by grade among school children aged 4 to 16 years [18]. Areca nut use were
20
21 higher among male than among female, a finding that is consistent with other studies conducted
22
23 in Tamil Nadu and Assam in India [17,23] and elsewhere [11]. However, finding also showed
24
25 that in 11 states, areca nut use was higher among women as compared to men. The age-wise
26
27 pattern suggests that areca nut use without tobacco began to decline from age 51 onwards. But in
28
29 the case of areca nut consumption with tobacco and in both forms, it increased with age. People
30
31 in more advanced ages who consume areca nut with tobacco were highly addicted and less aware
32
33 about the cessation methods.
34
35
36

37
38 Similar to other studies from India and other neighbouring countries [15,24], we also observed
39
40 higher use of areca nut with tobacco among daily wage/casual labourers. This study further adds
41
42 that areca nut use without tobacco too was largely consumed by daily wage/casual labourers,
43
44 followed by non-government sector. Evidences suggests that many misconceptions including
45
46 consuming areca nut improves concentration, pleasure, helps in anxiety and muscle relaxation
47
48 and suppresses appetite increases the likelihood of consumption among those who are engaged in
49
50 casual labour and have long working hours [14,25,26]. We found higher use of areca nut among
51
52 STs and SCs than other caste groups. Further, Muslims were more likely to consume all three
53
54
55
56
57
58
59

1
2
3 forms of areca nut as compared with Hindus. Previous studies documented higher use of tobacco
4 including SLT, among SCs/STs and Muslims [16,27].
5
6

7
8 State-wise urban-rural differences suggest that in 18 states, areca nut use was higher in urban
9 areas than in rural areas. Regression results also revealed higher use areca nut without tobacco in
10 urban areas than rural counterparts. Studies from India and Pakistan documented that *pan masala*
11 and *gutka* are very popular even in urban areas due to aggressive advertising, targeting middle
12 class and adolescents, which improved sale many tobacco and related products including areca
13 nut [28].
14
15
16
17
18
19
20
21

22
23 Our study had some limitations. Information related to areca nut use in different forms in the
24 GATS was based on respondents self-reporting. Thus, the study cannot rule out social
25 desirability bias – a tendency among some people to respond to questions in a way which they
26 deem to be more acceptable than would be their ‘correct’ answer [29]. Considering the cross-
27 sectional design of the survey, we did not examine the cause and effect relationship between
28 socioeconomic characteristics and areca nut use. Similarly, the available data did not allow us to
29 estimate trends of areca nut usage over time, but future analyses of repeated GATS may inform
30 on important trends. Another limitation is that the study is based on 15 years and older
31 population, whereas the areca nut habits often start at younger age. The future Global Youth
32 Tobacco Survey (GYTS) should have areca nut related questions similar to GATS so that
33 detailed usage pattern of areca nut could be examined among younger population of the country.

48 **Conclusion**

49
50
51 It is now well established that areca nut use in any form is highly addictive, a well known risk
52 factor for oral, pharynx and oesophageal cancers and is associated with many adverse health
53 effects. This study adds to the existing knowledge that areca nut consumption in India was much
54
55
56
57
58
59
60

1
2
3 higher than the overall smokeless tobacco. Moreover, a significant proportion of areca nut was
4 consumed along with tobacco, which elevates the adverse health impacts and co-morbidities
5 further. Thus, it calls for urgent policy intervention to prevent both new generations from taking
6 up areca nut use habit and helping current users to quit. Such policy efforts to control areca nut
7 use should be guided by the huge differences in its use across states, gender and socioeconomic
8 groups in the country. Unlike tobacco, for which the WHO FCTC provides evidence-based
9 policies, no global policy exists for the regulation and control of areca nut use and its cessation.
10 Also, there is a need for further research and population-based interventions to find treatment for
11 areca nut dependence. In addition, research is needed to examine the intention to quit among
12 areca nut users, separately for all three categories - those who use areca nut with tobacco,
13 without tobacco and those who use both forms, to develop an appropriate intervention model for
14 cessation. This information may be collected within the GATS survey by adding a few additional
15 questions on areca nut for future analysis. Given that areca nut use follows a complex pattern by
16 SES and regional trajectories, separately for with and without tobacco, future research is needed
17 to explore the various intersections between SES and areca nut use in different regions of India
18 to gain better clarity.

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	2	(a) Indicate the study's design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	5	Explain the scientific background and rationale for the investigation being reported	5-6
Objectives	6	State specific objectives, including any prespecified hypotheses	6
Methods			
Study design	6	Present key elements of study design early in the paper	6-7
Setting	6	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	6-7
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	7-9
Data sources/ measurement	6	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	7-9
Bias	8	Describe any efforts to address potential sources of bias	6
Study size	9	Explain how the study size was arrived at	6
Quantitative variables	8	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	9-10
Statistical methods	9-10	(a) Describe all statistical methods, including those used to control for confounding (b) Describe any methods used to examine subgroups and interactions (c) Explain how missing data were addressed (d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy (e) Describe any sensitivity analyses	9-10 10-10 6

Results			Page no
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage (c) Consider use of a flow diagram	12
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	12
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	12-14
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	12-14
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N.A.
Discussion			
Key results	18	Summarise key results with reference to study objectives	14
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	18
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	14-18
Generalisability	21	Discuss the generalisability (external validity) of the study results	19
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	19

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

BMJ Open

Areca nut consumption with and without tobacco among the adult population: a nationally representative study from India

Journal:	<i>BMJ Open</i>
Manuscript ID	bmjopen-2020-043987.R1
Article Type:	Original research
Date Submitted by the Author:	10-Mar-2021
Complete List of Authors:	Singh, Prashant Kumar; National Institute of Cancer Prevention and Research, Yadav, Amit Singh, Lucky; National Institute of Medical Statistics Mazumdar, Sumit; Centre for Health Economics Sinha, Dharendra ; South-East Regional Office, World Health Organisation, WHO FCTC Global Hub on Smokeless Tobacco Straif, Kurt; International Agency for Research on Cancer Singh, Shalini; Indian Council of Medical Research
Primary Subject Heading:	Smoking and tobacco
Secondary Subject Heading:	Addiction
Keywords:	Public health < INFECTIOUS DISEASES, Health policy < HEALTH SERVICES ADMINISTRATION & MANAGEMENT, Cancer pain < ONCOLOGY

1
2
3 **Areca nut consumption with and without tobacco among the adult population: a**
4 **nationally representative study from India**
5
6
7

8 **Abstract**
9

10
11 **Objective:** Areca nut is one of the most widely consumed substances globally, after nicotine,
12 ethanol and caffeine and classified as carcinogenic to humans. This study examines the
13 disparity and determinants of areca nut consumption with and without tobacco in India.
14
15

16
17
18 **Design:** Nationally representative cross-sectional study.
19

20
21 **Participants:** We utilized the nationally representative Global Adult Tobacco Survey
22 (GATS) 2016-17. The analytical sample size was 74,037 individual's aged 15 years and
23 above with a response rate of 92.9%.
24
25

26
27
28 **Measures:** Current consumption of areca nut without tobacco and with tobacco.
29

30
31 **Method:** We examined determinants of areca nut consumption (without tobacco and with
32 tobacco) using multinomial logistic regression, accounting for the survey design.
33
34

35
36 **Results:** About 23.9% (95%CI 23.1-24.8) of the adult population consume areca nut, i.e.
37 approximately 223.79 million people in India; 9.7% (95%CI 9.1-10.4) the majority of users
38 (14.2% 95%CI 13.5-14.9) consumed areca nut with tobacco. When compared to females,
39 males were more likely to consume areca nut (with tobacco RR=2.02; 95%CI 1.85-2.21 and
40 without tobacco RR=1.13; 95%CI 1.07-1.20). Age, marital status, education, occupation,
41 caste, religion and region were significantly associated with areca nut consumption.
42 However, the direction and magnitude of association differs with respect to the areca nut
43 consumption with and without tobacco.

6 **Strengths and Limitations of this study**
7
8

- 9
- 10 • Using a nationally representative survey with a high response rate, this study
11 disentangled the current prevalence of areca nut consumption with and without
12 tobacco in India, which has significant policy implications.
13
 - 14 • The study provided detailed information on socioeconomic determinants of areca nut
15 consumption, with and without tobacco, and separately for men and women, which
16 may further guide future policy
17
 - 18 • The survey covers only people 15 years and older, whereas areca nut consumption
19 often starts at younger age.
20
 - 21 • The survey is cross-sectional and cannot provide insights into trends of Areca nut
22 consumption over time.

Introduction

Areca nut is one of the most widely consumed substances globally, after nicotine, ethanol and caffeine[1,2]. Owing to its addictive properties, areca nut is estimated to be consumed by hundreds of millions of people across various countries [3]. However, addiction to areca nut is primarily prevalent in many Asia-Pacific countries and by emigrants from these countries in other parts of world [3]. It is not only known by several, sometimes local names, but also consumed in several forms e.g. pan masala, gutkha, mawa, dohra, kharra, betel etc. with or without tobacco[4,5]. Some forms of consumption may also include other constituents, such as betel leaf, slaked lime and various spices.

The International Agency for Research on Cancer (IARC) classified areca nut consumption with or without tobacco as carcinogenic to humans[6]. A meta-analysis based on 50 studies worldwide reported increased relative risks for cancer of the oral cavity and oropharynx for the Indian subcontinent and areca nut consumption with tobacco (Relative Risk 7.03; 95%CI, 4.68–10.56) and areca nut consumption without tobacco (Relative Risk 3.22; 95%CI, 2.11–4.92) [7]. A global systematic review based on 62 studies concluded that consumption of areca nut affects almost all organs of the human body, including the brain, heart, lungs, gastrointestinal tract and reproductive organs; and causes or aggravates pre-existing conditions such as neuronal injury, myocardial infarction, cardiac arrhythmias, hepatotoxicity, asthma, central obesity, type II diabetes, hyperlipidemia, metabolic syndrome[8]. It has harmful effects on the foetus when used during pregnancy[8]. Previous studies observed that areca nut dependency among users [9] and its withdrawal effects [10] were similar to those observed among nicotine users [10]. It is also a gateway product in children who start using different kinds of areca nut products at an early age [11].

Despite growing scientific evidence of high addictiveness and several ill effects(8-11) associated with areca nut consumption, research on areca nut has not received much

1
2
3 attention[3]. The large global and national movement that addresses tobacco control under
4 the ambit of the WHO Framework Convention on Tobacco Control (FCTC) has focused
5 primarily on smoking and has been less effective in controlling smokeless tobacco (SLT)
6 [12]. The regulatory framework for areca nut control has also remained limited to prescribing
7 health warnings on areca nut products by the Food Safety and Standard Authority of India
8 (FSSAI). Further, use of tobacco and nicotine as an ingredient in any food item is also
9 prohibited under FSSAI regulations, thereby restricting mixing of tobacco in areca nut
10 products and vice-versa[1]. Although tobacco control policies are applicable to areca nut
11 products which contain tobacco a considerable number of people now consume areca nut
12 without tobacco, which poses greater public health challenges in controlling and regulating
13 the substance [13].

14
15 A comprehensive search of the literature revealed that studies on areca nut use in India lack
16 representativeness and published studies were restricted to a specific geographical area or
17 population groups. None of the published studies have examined diverse habits of areca nut
18 consumption, its disparity and determinants using a nationally representative survey. Also, a
19 recent global review calls for more research to better understand the epidemiology of areca
20 nut consumption across different populations and geographies [3].

21
22 India, with a population of over 1.30 billion, exhibits one of the highest socioeconomic and
23 demographic heterogeneities ever experienced anywhere in the world at the regional
24 level[14]. There is considerable evidence of marked regional inequities in tobacco use[15],
25 health and healthcare [16]and mortality outcomes [17]in India. These differences are
26 primarily the outcome of differences in community-level development, population
27 composition, state health expenditure, poverty levels, status of women, and availability,
28 accessibility and affordability of maternal and child health care services and their utilization
29 [18–20].

1
2
3 While India's share to overall areca nut production and consumption remains at the top in the
4 world, no attempts have been made to explore the patterns and determinants of the
5 consumption of areca nut based on large scale representative surveys. This study aims to
6 examine the disparity and determinants of areca nut consumption, with and without tobacco
7 using the nationally-representative Global Adult Tobacco Survey (GATS) conducted in 2016-
8 17.

17 **Methods and materials**

20 ***Study Design and Participants***

23 We utilized the nationally representative cross-sectional Global Adult Tobacco Survey
24 (GATS) 2016-17, conducted in all 29 states and three Union Territories (UTs) of India [21].
25 The study included whole GATS sample of 74,037 adults aged 15 and above. A multi-stage
26 sampling design separately for rural and urban areas was adopted to draw a representative
27 sample considering the 2011 census population figures. The household response rate and
28 person-level response rate were 96.7 percent and 96.0 percent respectively resulting in an
29 overall response rate of 92.9 percent.

32 The sampling was done independently in each state/UT; and within the state/UT, it was done
33 independently for urban and rural areas. In urban areas, a three stage sampling process was
34 adopted. At the first level, the list of all the wards from all cities and towns of the state/ UT
35 constituted the urban sampling frame, from which a required sample of wards (Primary
36 Sampling Units - PSUs) was selected using probability proportional to size (PPS) sampling.
37 At the second level, a list of all census enumeration blocks (CEBs) in each selected ward
38 constituted the sampling frame from which one CEB was selected by PPS from each ward. At
39 the third level, a list of all residential households in each selected CEB constituted the
40 sampling frame, from which a sample of required number of households was selected.

1
2
3 In rural areas, a two stage sampling process was adopted. At the first stage of sampling, all
4 villages in the state/UT formed the sampling frame. All small villages having less than five
5 households were removed from the sampling frame. Villages with five to 49 households as
6 per Census of India, 2011 were linked with the neighbouring larger villages. The required
7 number of PSUs (villages) within each stratum was selected according to PPS sampling. At
8 the second stage, a list of all residential households in each selected village constituted the
9 sampling frame, from which a sample of the required number of households was selected.

10
11
12 A household listing operation was carried out in each sample area. All large villages with 300
13 or more households were segmented into three or more segments (depending on village size)
14 of almost equal proportions, each being about 100-200 households. From all the segments in
15 each large village, two segments were selected by using PPS sampling. Thirty households
16 (plus three more, accounting for non-response) were selected from the list of households by
17 systematic random sampling. The 33 selected households in a PSU were divided into two
18 groups: 1) households for interview of a male member, and 2) households for interview of a
19 female member; this was in proportion to the total sample size of male and female interviews
20 in a state. From the total number of male/ female members aged 15 or above in a household,
21 one member was randomly selected for the interview.

22
23
24 Further details related to survey methodology, sampling design, household and individual
25 selection, data collection, management and monitoring procedures have been described
26 elsewhere[21].

27 ***Dependent variables***

28
29 The outcome variable was current consumption of areca nut use, assessed based on the
30 following questions covered in the GATS:

- 31 i. Do you consume *pan masala* without tobacco? (response options: yes, no and

- 1
2
3 refused)
4
5
6 ii. Do you consume betel quid without tobacco? (response options: yes, no and refused)
7
8 iii. Do you consume areca nut of any type, plain, powdered or flavoured? (response
9
10 options: yes, no and refused)
11
12 iv. Betel quid with tobacco? (response: on average, how many times a day do you use)
13
14 v. *Gutka*, areca nut-tobacco lime mixture, or *mawa*? (response: on average, how many
15
16 times a day do you use)
17
18
19 vi. *Pan masala* with tobacco? (response: on average, how many times a day do you use)
20
21

22 Based on the above-mentioned questions asked in GATS, we constructed three sets of
23 variables: (i) areca nut consumption only without tobacco, (ii) areca nut consumption only
24 with tobacco and (iii) areca nut consumption with and without tobacco, dual use. Definition
25 of specific products can be found with the GATS 2 national report[22].
26
27
28
29
30

31 ***Independent variables***

32
33
34 A range of socioeconomic (education, occupation, caste, religious affiliation and wealth
35 quintile), demographic (age, sex, marital status,), awareness related and contextual level
36 variables included in this study which were found to be associated with areca nut
37 consumption in previous studies [23–27]. These variables include age (categorised as 15-18,
38 19-23, 24-30, 31-40, 41-50, 51-60 and 60+) and sex as male and female. Individual's
39 education was measured as: (i) no formal education, (ii) below primary, (iii) primary
40 completed, (iv) below secondary, (v) secondary completed, (vi) completed higher secondary,
41 (vii) completed college/university and (viii) completed post-graduate level. Individual's
42 occupation on the other side was assessed based on self-reported information as (i) student,
43 (ii) government sector, (iii) non-government sector, (iv) casual/ daily labourer, (v) self-
44 employed, (vi) homemaker, (vii) retired and (viii) unemployed.

3 A wealth index was calculated based on availability of electricity, flush toilet, radio,
4 television, fixed telephone or cell phone, refrigerator, washing machine,
5 moped/scooter/motorcycle and car using Principle Component Analysis (PCA)
6 methodology[28]. There are various ways to assign weighting values to the indicator
7 variables. Ad hoc weights, such as assigning “1” for a bicycle, “3” for a motorcycle, and “5”
8 for a car or truck, work to a certain extent, but they are arbitrary and are difficult to assign
9 when the wealth ordering is not readily apparent. For this reason, Filmer and Pritchett
10 recommended using principal components analysis (PCA) to assign the indicator weights, the
11 procedure that is used for the wealth index[29]. This procedure first standardizes the indicator
12 variables (calculating z scores); then the factor coefficient scores (factor loadings) are
13 calculated; and finally, for each household, the indicator values are multiplied by the loadings
14 and summed to produce the household’s index value. In this process, only the first of the
15 factors produced is used to represent the wealth index. The resulting sum is itself a
16 standardized score with a mean of zero and a standard deviation of one[28]. Individuals were
17 divided into five wealth quintiles based on their household score ranges from 1 being poorest
18 to 5 being wealthiest, with each category representing 20 percent of the score[28].

37
38
39
40
41 A composite knowledge variable which measures the poor health impact of smokeless
42 tobacco use was constructed based on the following information asked in the survey:
43 smokeless tobacco causes serious illness (yes/no), smokeless tobacco cause oral cancer
44 (yes/no), smokeless tobacco cause dental diseases (yes/no), smokeless tobacco cause harm to
45 fetus during pregnancy (yes/no), and do you think smokeless tobacco leads to addiction
46 (yes/no). The new knowledge variable was categorised as: (i) ‘no, to all five awareness’ (ii)
47 ‘no, to at least one awareness’ and (iii) ‘yes, to all five awareness’.

54
55
56
57 Caste (social group) as categorised based on individual’s self-reporting as Scheduled Castes
58 (SCs), Scheduled Tribes (STs), Other Backward Classes (OBCs) and others. This broad
59
60

1
2
3 categorization of caste is based on their socioeconomic disadvantage in education, health,
4 nutrition, and employment by federal government. For instance, a study has shown that as
5 compared to other caste, children (age 2-5 years) and adolescents (age 6-18 years) belonging
6 to scheduled tribes had the greatest risk of mortality (OR = 1.94, 95% CI = 1.47, 2.57),
7 followed by those from scheduled castes (OR = 1.35, 95% CI = 1.05, 1.74) and other
8 backward classes (OR = 1.33, 95% CI = 1.05,1.67) [17]. Other studies have also shown lower
9 enrolment and completion of education among scheduled castes and scheduled tribes due to
10 various factors [30,31]. Religion captures self-reported follower/believer of Hinduism, Islam,
11 Christianity and others (which mainly include Sikhs, Jains, Buddhists and non-believers). The
12 study also considered place of residence as rural and urban as well as all 29 states and three
13 UTs in the analysis.

24 *Analytical strategy*

25
26 At first, prevalence of areca nut consumption with and without tobacco at national and sub-
27 national levels along with rural-urban and male-female differences was analyzed. Chi-
28 squared (χ^2) tests were performed to examine whether variations in areca nut consumption
29 across independent variables were statistically significant. To examine the associated
30 between areca nut consumption with various socioeconomic and demographic characteristics,
31 multinomial logistic regression was used. In the multinomial logit regression, it is assumed
32 that log odds of outcome/dependent variable either follow linear form or non-binary form;
33 each outcome/dependent variable is modelled relative to the baseline group or outcome[32].
34 In this study, we have considered (i) 'non-areca nut user (baseline group)', (ii) 'areca nut
35 consumption only with tobacco', (iii) areca nut consumption only without tobacco' and (iv)
36 'areca nut consumption with and without tobacco, dual use'. The study reported the relative
37 risk ratio (RRR) along with 95% confidence intervals [33]. We calculated the population
38 burden based on GATS weighted sample population figures, which were provided in the

58
59
60

1
2
3 were predominately consumed in many north-eastern states, while betel quid without tobacco
4
5 was mainly used in south (**Supplementary table 2**).

8 ***Regional disparity in areca nut consumption***

10
11 We found 23.9 (95%CI 23.1-24.8) adults were consuming areca nut at national level and
12
13 14.2% (95%CI 13.6-14.9) were consuming areca nut without tobacco (**Table 2**). **Figure 1**
14
15 shows considerable variations in areca nut consumption across states and UTs of India. In
16
17 many states areca nut consumption in any form was over 40% among men (like, Uttar
18
19 Pradesh, Assam Meghalaya, Mizoram, and Manipur) and women (like, Karnataka, and all
20
21 north-eastern states except Nagaland). Areca nut consumption without tobacco was largely
22
23 being consumed across north-eastern states, apart from other bigger states like Karnataka
24
25 (28.8%; 95%CI 25.6-32.1), Tamil Nadu (25.5%; 95%CI 21.9-29.5) and Maharashtra (20%;
26
27 95%CI 17.0-22.5). Nearly 223.4 million people out of the total 932,488,000 population aged
28
29 15 and above consume areca nut in India (**Table 3**). The distribution of areca nut users both
30
31 in terms of population and proportion across states were as follows: Uttar Pradesh with 49.9
32
33 million users contributes to nearly 22% of all areca nut users, followed by Maharashtra with
34
35 26.7 million users (12%), Karnataka with 19.8 million (9%) and Tamil Nadu with 17.7
36
37 million users (8%). Together, these four states share nearly 51% of all areca nut users in the
38
39 country. Not much difference exists between urban and rural areas in areca nut usage patterns
40
41 (**Supplementary table 3**). In 18 states/UTs, however, areca nut consumption was higher in
42
43 urban areas than rural counterparts. In 13 states/UTs, the opposite pattern was evident.

50 ***Demographic and socioeconomic differences in areca nut consumption***

52
53 Consumption of areca nut in any form was higher among males as compared to females both
54
55 at national level as well as in a majority of states (**Supplementary table 4**). All forms of
56
57 areca nut consumption were higher in the age group 31-50 years (**Table 4**) as compared with
58
59
60

1
2
3 other age categories. 28.8% men (95%CI 27.7-30.0) and 27.1% widowed/separated/divorced
4 (95%CI 25.3-29.1) were consuming areca nut. Individuals who had completed below the
5 primary level of schooling consumed higher proportion of areca nut. Areca nut consumption
6 was highest among daily wage labourers (30.2%; 95%CI 28.7-31.7). We found that a high
7 percentage of Scheduled Tribes (25.6%; 95%CI 23.0-27.5) and Muslims (30.8%; 95%CI
8 28.4-33.2) were consuming areca nut.

17 *Determinants of areca nut consumption: regression analysis*

19
20 Regression results suggest that as compared to 15-18 age group, the likelihood of areca nut
21 consumption with tobacco and dual use was higher in higher age groups (**Table 5**); except
22 that areca nut consumption without tobacco was lower among the age group 51 and above, as
23 compared to the 15-18 age groups. Probability of areca nut consumption was higher among
24 males as compared to females for all three forms. The likelihood of areca nut consumption
25 without tobacco was higher across all the educational categories as compared to those who
26 had no formal education. However, the probability of areca nut consumption with tobacco
27 and in dual-form was declining with increase in the education level of respondents. The
28 likelihood of areca nut consumption with tobacco and dual-use was significantly higher
29 among Schedules Castes than Other castes. Probability of all the three forms of areca nut
30 consumption was higher among Muslims as compared to Hindus.

46 **Discussion**

47
48 The findings of the study revealed that nearly one out of every four adults in India consumes
49 areca nut, that is, almost 223.79 million users, making areca nut consumption a bigger public
50 health challenge than use of smokeless tobacco (199 million users) in dealing with substance
51 use and addiction in the country. The large number of users of areca nut, a known carcinogen
52 presents a huge public health challenge for the country. Moreover, nearly 10% consume areca
53
54
55
56
57
58
59
60

1
2
3 nut with tobacco. Thus, considering the wide range of adverse health impacts, effective
4 implementation on banning of tobacco as an ingredient with areca nut products under
5 regulation 2.3.4 of the Food Safety and Standards Regulation, 2011 and ban on manufacture
6 and sale of areca nut products, as implemented in some of the states, is urgently needed [1].
7
8
9
10
11

12 We found considerable regional and socioeconomic differences in the consumption of areca
13 nut. In four states, Meghalaya, Assam, Mizoram and Manipur, over half of the population
14 consume areca nut. Further, Karnataka, Uttar Pradesh, Tamil Nadu, Maharashtra and Odisha,
15 constitute nearly 55% of the country's areca nut users. As far as other determinants are
16 concerned, the findings confirmed that age, gender, marital status, education, occupation,
17 castes and religion are significantly associated with areca nut consumption. However, the
18 direction of association differs with respect to areca nut consumption with and without
19 tobacco. Cheaper and abundant availability, due to large scale domestic production of areca
20 nut could be one of the key reasons for such high prevalence in the country.
21
22
23
24
25
26
27
28
29
30
31
32
33

34 We found protective effect of secondary and above level education in the case of areca nut
35 consumption with tobacco and in both forms. A study from Pakistan also observed that the
36 consumption of areca nut users increased by grade among school children aged 4 to 16 years
37 [27]. Areca nut consumption were higher among male than among female, a finding that is
38 consistent with other studies conducted in Tamil Nadu and Assam in India [26,35] and
39 countries like Thailand and Taiwan [13]. It may be because areca nut consumption results in
40 staining of teethe which may not be liked by young and adult females. The age-wise pattern
41 suggests that areca nut consumption without tobacco began to decline from age 51 onwards.

56
57
58
59
60

61 Similar to other studies from India and other neighbouring countries [24,36], we also
62 observed higher consumption of areca nut with tobacco among daily wage/casual labourers.

1
2
3 This study further adds that areca nut consumption without tobacco too was largely
4 consumed by daily wage/casual labourers, followed by non-government sector. Evidences
5 suggests that many misconceptions including consuming areca nut improves concentration,
6 pleasure, helps in anxiety and muscle relaxation and suppresses appetite increases the
7 likelihood of consumption among those who are engaged in casual labour and have long
8 working hours [23,37,38]. We found higher consumption of areca nut among STs and SCs
9 than other caste groups. Further, Muslims were more likely to consume all three forms of
10 areca nut as compared with Hindus. Previous studies documented higher consumption of
11 tobacco including SLT, among SCs/STs and Muslims [25,39].

23

24 Urban-rural differences by state suggest that in 18 states, areca nut consumption was higher
25 in urban areas than in rural areas. Regression results also revealed higher consumption of
26 areca nut without tobacco in urban areas than rural counterparts. This is likely due to higher
27 awareness about harms related to tobacco use in urban areas than rural counterparts. Studies
28 from India and Pakistan documented that *pan masala* and *gutka* are very popular even in
29 urban areas due to aggressive advertising, targeting middle class and adolescents, which
30 improved sale many tobacco and related products including areca nut [40].

39
40

41 Our study had some limitations. Information related to areca nut consumption in different
42 forms in the GATS was based on respondents self-reporting. Thus, the study cannot rule out
43 social desirability bias – a tendency among some people to respond to questions in a way
44 which they deem to be more acceptable than would be their ‘correct’ answer [41]. The
45 nomenclature of various areca nut products in geographically diverse country like India could
46 be a source of concern, which is difficult to capture in the large scale surveys. Considering
47 the cross-sectional design of the survey, we did not examine the cause and effect relationship
48 between socioeconomic characteristics and areca nut consumption. Similarly, the available
49 data did not allow us to estimate trends of areca nut usage over time, but future analyses of
50
51
52
53
54
55
56
57
58
59
60

1
2
3 repeated GATS may inform on important trends. Another limitation is that the study is based
4
5 on 15 years and older population, whereas the areca nut habits often start at younger age. The
6
7 future Global Youth Tobacco Survey (GYTS) should have areca nut related questions similar
8
9 to GATS so that detailed usage pattern of areca nut could be examined among younger
10
11 population of the country.
12
13

14 15 **Conclusion**

16
17
18 It is now well established that areca nut consumption in any form is highly addictive, a well-
19
20 known risk factor for oral, pharynx and oesophageal cancers and is associated with many
21
22 adverse health effects. This study adds to the existing knowledge that areca nut consumption
23
24 in India was much higher than the overall smokeless tobacco. Moreover, a significant
25
26 proportion of areca nut was consumed along with tobacco, which elevates the adverse health
27
28 impacts and co-morbidities further. Thus, it calls for urgent policy intervention to prevent
29
30 both new generations from taking up areca nut consumption habit and helping current users
31
32 to quit. Such policy efforts to control areca nut consumption should be guided by the huge
33
34 differences in its consumption across states, gender and socioeconomic groups in India.
35
36 Unlike tobacco, for which the WHO FCTC provides evidence-based policies, no global
37
38 policy exists for the regulation and control of areca nut consumption and its cessation. Also,
39
40 there is a need for further research and population-based interventions to find treatment for
41
42 areca nut dependence. In addition, research is needed to examine the intention to quit among
43
44 areca nut users, separately for all three categories - those who consumption areca nut with
45
46 tobacco, without tobacco and those who consume in both the forms, to develop an
47
48 appropriate intervention model for cessation. This information may be collected within the
49
50 GATS survey by adding a few additional questions on areca nut for future analysis. Given
51
52 that areca nut consumption follows a complex pattern by SES and regional trajectories,
53
54 separately for with and without tobacco, future research is needed to explore the various
55
56
57
58
59
60

1
2
3 intersections between SES and areca nut consumption in different regions of India to gain
4
5 better clarity.

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	2	(a) Indicate the study's design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	5	Explain the scientific background and rationale for the investigation being reported	5-6
Objectives	6	State specific objectives, including any prespecified hypotheses	6
Methods			
Study design	6	Present key elements of study design early in the paper	6-7
Setting	6	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	6-7
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	7-9
Data sources/ measurement	6	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	7-9
Bias	8	Describe any efforts to address potential sources of bias	6
Study size	9	Explain how the study size was arrived at	6
Quantitative variables	8	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	9-10
Statistical methods	9-10	(a) Describe all statistical methods, including those used to control for confounding (b) Describe any methods used to examine subgroups and interactions (c) Explain how missing data were addressed (d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy (e) Describe any sensitivity analyses	9-10 10-10 6

For peer review only

Results			Page no
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage (c) Consider use of a flow diagram	12
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	12
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	12-14
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	12-14
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N.A.
Discussion			
Key results	18	Summarise key results with reference to study objectives	14
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	18
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	14-18
Generalisability	21	Discuss the generalisability (external validity) of the study results	19
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	19

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.

BMJ Open

Areca nut consumption with and without tobacco among the adult population: a nationally representative study from India

Journal:	<i>BMJ Open</i>
Manuscript ID	bmjopen-2020-043987.R2
Article Type:	Original research
Date Submitted by the Author:	24-Mar-2021
Complete List of Authors:	Singh, Prashant Kumar; National Institute of Cancer Prevention and Research, Yadav, Amit Singh, Lucky; National Institute of Medical Statistics Mazumdar, Sumit; Centre for Health Economics Sinha, Dharendra ; South-East Regional Office, World Health Organisation, WHO FCTC Global Hub on Smokeless Tobacco Straif, Kurt; International Agency for Research on Cancer Singh, Shalini; Indian Council of Medical Research
Primary Subject Heading:	Smoking and tobacco
Secondary Subject Heading:	Addiction
Keywords:	Public health < INFECTIOUS DISEASES, Health policy < HEALTH SERVICES ADMINISTRATION & MANAGEMENT, Cancer pain < ONCOLOGY

3 **Areca nut consumption with and without tobacco among the adult population: a**
4 **nationally representative study from India**
5
6
7

8 **Abstract**
9

10
11 **Objective:** Areca nut is one of the most widely consumed substances globally, after nicotine,
12 ethanol and caffeine and classified as carcinogenic to humans. This study examines the
13 disparity and determinants of areca nut consumption with and without tobacco in India.
14
15

16
17
18 **Design:** Nationally representative cross-sectional study.
19

20
21 **Participants:** We utilized the nationally representative Global Adult Tobacco Survey
22 (GATS) 2016-17. The analytical sample size was 74,037 individual's aged 15 years and
23 above with a response rate of 92.9%.
24
25

26
27
28 **Measures:** Current consumption of areca nut without tobacco and with tobacco.
29

30
31 **Method:** We examined determinants of areca nut consumption (without tobacco and with
32 tobacco) using multinomial logistic regression, accounting for the survey design.
33
34

35
36 **Results:** About 23.9% (95%CI 23.1-24.8) of the adult population consume areca nut, i.e.
37 approximately 223.79 million people in India; majority of users (14.2% 95%CI 13.5-14.9)
38 consumed areca nut with tobacco. When compared to females, males were more likely to
39 consume areca nut (with tobacco RR=2.02; 95%CI 1.85-2.21 and without tobacco RR=1.13;
40 95%CI 1.07-1.20). Age, marital status, education, occupation, caste, religion and region were
41 significantly associated with areca nut consumption. However, the direction and magnitude
42 of association differs with respect to the areca nut consumption with and without tobacco.
43
44
45
46
47
48
49
50

51
52
53 **Conclusion:** The on-going tobacco control efforts would not address the majority of areca
54 nut users until greater attention to areca nut consumption with and without tobacco is
55 reflected in health policies in India.

review only

Introduction

Areca nut is one of the most widely consumed substances globally, after nicotine, ethanol and caffeine[1,2]. Owing to its addictive properties, areca nut is estimated to be consumed by hundreds of millions of people across various countries [3]. However, addiction to areca nut is primarily prevalent in many Asia-Pacific countries and by emigrants from these countries in other parts of world [3]. It is not only known by several, sometimes local names, but also consumed in several forms e.g. pan masala, gutkha, mawa, dohra, kharra, betel etc. with or without tobacco[4,5]. Some forms of consumption may also include other constituents, such as betel leaf, slaked lime and various spices.

The International Agency for Research on Cancer (IARC) classified areca nut consumption with or without tobacco as carcinogenic to humans[6]. A meta-analysis based on 50 studies worldwide reported increased relative risks for cancer of the oral cavity and oropharynx for the Indian subcontinent and areca nut consumption with tobacco (Relative Risk 7.03; 95%CI, 4.68–10.56) and areca nut consumption without tobacco (Relative Risk 3.22; 95%CI, 2.11–4.92) [7]. A global systematic review based on 62 studies concluded that consumption of areca nut affects almost all organs of the human body, including the brain, heart, lungs, gastrointestinal tract and reproductive organs; and causes or aggravates pre-existing conditions such as neuronal injury, myocardial infarction, cardiac arrhythmias, hepatotoxicity, asthma, central obesity, type II diabetes, hyperlipidemia, metabolic syndrome[8]. It has harmful effects on the foetus when used during pregnancy[8]. Previous studies observed that areca nut dependency among users [9] and its withdrawal effects [10] were similar to those observed among nicotine users [10]. It is also a gateway product in children who start using different kinds of areca nut products at an early age [11].

Despite growing scientific evidence of high addictiveness and several ill effects(8-11) associated with areca nut consumption, research on areca nut has not received much

1
2
3 attention[3]. The large global and national movement that addresses tobacco control under
4 the ambit of the WHO Framework Convention on Tobacco Control (FCTC) has focused
5 primarily on smoking and has been less effective in controlling smokeless tobacco (SLT)
6 [12]. The regulatory framework for areca nut control has also remained limited to prescribing
7 health warnings on areca nut products by the Food Safety and Standard Authority of India
8 (FSSAI). Further, use of tobacco and nicotine as an ingredient in any food item is also
9 prohibited under FSSAI regulations, thereby restricting mixing of tobacco in areca nut
10 products and vice-versa[1]. Although tobacco control policies are applicable to areca nut
11 products which contain tobacco a considerable number of people now consume areca nut
12 without tobacco, which poses greater public health challenges in controlling and regulating
13 the substance [13].

16
17
18
19
20
21
22
23
24
25
26
27
28

29 A comprehensive search of the literature revealed that studies on areca nut use in India lack
30 representativeness and published studies were restricted to a specific geographical area or
31 population groups. None of the published studies have examined diverse habits of areca nut
32 consumption, its disparity and determinants using a nationally representative survey. Also, a
33 recent global review calls for more research to better understand the epidemiology of areca
34 nut consumption across different populations and geographies [3].
35
36
37
38
39
40
41
42

43 India, with a population of over 1.30 billion, exhibits one of the highest socioeconomic and
44 demographic heterogeneities ever experienced anywhere in the world at the regional
45 level[14]. There is considerable evidence of marked regional inequities in tobacco use[15],
46 health and healthcare [16]and mortality outcomes [17]in India. These differences are
47 primarily the outcome of differences in community-level development, population
48 composition, state health expenditure, poverty levels, status of women, and availability,
49 accessibility and affordability of maternal and child health care services and their utilization
50 [18–20].

1
2
3 While India's share to overall areca nut production and consumption remains at the top in the
4 world, no attempts have been made to explore the patterns and determinants of the
5 consumption of areca nut based on large scale representative surveys. This study aims to
6 examine the disparity and determinants of areca nut consumption, with and without tobacco
7 using the nationally-representative Global Adult Tobacco Survey (GATS) conducted in 2016-
8 17.

17 **Methods and materials**

20 ***Study Design and Participants***

23 We utilized the nationally representative cross-sectional Global Adult Tobacco Survey
24 (GATS) 2016-17, conducted in all 29 states and three Union Territories (UTs) of India [21].
25 The study included whole GATS sample of 74,037 adults aged 15 and above. A multi-stage
26 sampling design separately for rural and urban areas was adopted to draw a representative
27 sample considering the 2011 census population figures. The person level response rate was
28 96.0 percent (95.6% in urban areas and 96.3% in rural areas). The overall response rate,
29 calculated as the product of response rates at the household and person level, was 92.9
30 percent.

31
32
33
34
35
36
37
38
39
40
41
42 The sampling was done independently in each state/UT; and within the state/UT, it was done
43 independently for urban and rural areas. In urban areas, a three stage sampling process was
44 adopted. At the first level, the list of all the wards from all cities and towns of the state/ UT
45 constituted the urban sampling frame, from which a required sample of wards (Primary
46 Sampling Units - PSUs) was selected using probability proportional to size (PPS) sampling.
47
48
49 At the second level, a list of all census enumeration blocks (CEBs) in each selected ward
50 constituted the sampling frame from which one CEB was selected by PPS from each ward. At
51
52
53
54
55
56
57
58
59
60

1
2
3 the third level, a list of all residential households in each selected CEB constituted the
4
5 sampling frame, from which a sample of required number of households was selected.
6
7

8 In rural areas, a two stage sampling process was adopted. At the first stage of sampling, all
9
10 villages in the state/UT formed the sampling frame. All small villages having less than five
11
12 households were removed from the sampling frame. Villages with five to 49 households as
13
14 per Census of India, 2011 were linked with the neighbouring larger villages. The required
15
16 number of PSUs (villages) within each stratum was selected according to PPS sampling. At
17
18 the second stage, a list of all residential households in each selected village constituted the
19
20 sampling frame, from which a sample of the required number of households was selected.
21
22
23

24 A household listing operation was carried out in each sample area. All large villages with 300
25
26 or more households were segmented into three or more segments (depending on village size)
27
28 of almost equal proportions, each being about 100-200 households. From all the segments in
29
30 each large village, two segments were selected by using PPS sampling. Thirty households
31
32 (plus three more, accounting for non-response) were selected from the list of households by
33
34 systematic random sampling. The 33 selected households in a PSU were divided into two
35
36 groups: 1) households for interview of a male member, and 2) households for interview of a
37
38 female member; this was in proportion to the total sample size of male and female interviews
39
40 in a state. From the total number of male/ female members aged 15 or above in a household,
41
42 one member was randomly selected for the interview.
43
44
45
46
47

48 Further details related to survey methodology, sampling design, household and individual
49
50 selection, data collection, management and monitoring procedures have been described
51
52 elsewhere[21].
53
54

55 ***Dependent variables***

56
57
58
59
60

The outcome variable was current consumption of areca nut use, assessed based on the following questions covered in the GATS:

- i. Do you consume *pan masala* without tobacco? (response options: yes, no and refused)
- ii. Do you consume betel quid without tobacco? (response options: yes, no and refused)
- iii. Do you consume areca nut of any type, plain, powdered or flavoured? (response options: yes, no and refused)
- iv. Betel quid with tobacco? (response: on average, how many times a day do you use)
- v. *Gutka*, areca nut-tobacco lime mixture, or *mawa*? (response: on average, how many times a day do you use)
- vi. *Pan masala* with tobacco? (response: on average, how many times a day do you use)

Based on the above-mentioned questions asked in GATS, we constructed three sets of variables: (i) areca nut consumption only without tobacco, (ii) areca nut consumption only with tobacco and (iii) areca nut consumption with and without tobacco, dual use. Definition of specific products can be found with the GATS 2 national report[22].

Independent variables

A range of socioeconomic (education, occupation, caste, religious affiliation and wealth quintile), demographic (age, sex, marital status,), awareness related and contextual level variables included in this study which were found to be associated with areca nut consumption in previous studies [23–27]. These variables include age (categorised as 15-18, 19-23, 24-30, 31-40, 41-50, 51-60 and 60+) and sex as male and female. Individual's education was measured as: (i) no formal education, (ii) below primary, (iii) primary completed, (iv) below secondary, (v) secondary completed, (vi) completed higher secondary, (vii) completed college/university and (viii) completed post-graduate level. Individual's

1
2
3 occupation on the other side was assessed based on self-reported information as (i) student,
4
5 (ii) government sector, (iii) non-government sector, (iv) casual/ daily labourer, (v) self-
6
7 employed, (vi) homemaker, (vii) retired and (viii) unemployed.
8
9

10 A wealth index was calculated based on availability of electricity, flush toilet, radio,
11
12 television, fixed telephone or cell phone, refrigerator, washing machine,
13
14 moped/scooter/motorcycle and car using Principle Component Analysis (PCA)
15
16 methodology[28]. There are various ways to assign weighting values to the indicator
17
18 variables. Ad hoc weights, such as assigning “1” for a bicycle, “3” for a motorcycle, and “5”
19
20 for a car or truck, work to a certain extent, but they are arbitrary and are difficult to assign
21
22 when the wealth ordering is not readily apparent. For this reason, Filmer and Pritchett
23
24 recommended using principal components analysis (PCA) to assign the indicator weights, the
25
26 procedure that is used for the wealth index[29]. This procedure first standardizes the indicator
27
28 variables (calculating z scores); then the factor coefficient scores (factor loadings) are
29
30 calculated; and finally, for each household, the indicator values are multiplied by the loadings
31
32 and summed to produce the household’s index value. In this process, only the first of the
33
34 factors produced is used to represent the wealth index. The resulting sum is itself a
35
36 standardized score with a mean of zero and a standard deviation of one[28]. Individuals were
37
38 divided into five wealth quintiles based on their household score ranges from 1 being poorest
39
40 to 5 being wealthiest, with each category representing 20 percent of the score[28].
41
42
43
44
45
46
47

48 A composite knowledge variable which measures the poor health impact of smokeless
49
50 tobacco use was constructed based on the following information asked in the survey:
51
52 smokeless tobacco causes serious illness (yes/no), smokeless tobacco cause oral cancer
53
54 (yes/no), smokeless tobacco cause dental diseases (yes/no), smokeless tobacco cause harm to
55
56 fetus during pregnancy (yes/no), and do you think smokeless tobacco leads to addiction
57
58 (yes/no). The new knowledge variable was categorised as: (i) ‘no, to all five awareness’ (ii)
59
60

1
2
3 'no, to at least one awareness' and (iii) 'yes, to all five awareness'.
4
5

6 Caste (social group) as categorised based on individual's self-reporting as Scheduled Castes
7 (SCs), Scheduled Tribes (STs), Other Backward Classes (OBCs) and others. This broad
8 categorization of caste is based on their socioeconomic disadvantage in education, health,
9 nutrition, and employment by federal government. For instance, a study has shown that as
10 compared to other caste, children (age 2-5 years) and adolescents (age 6-18 years) belonging
11 to scheduled tribes had the greatest risk of mortality (OR = 1.94, 95% CI = 1.47, 2.57),
12 followed by those from scheduled castes (OR = 1.35, 95% CI = 1.05, 1.74) and other
13 backward classes (OR = 1.33, 95% CI = 1.05, 1.67) [17]. Other studies have also shown lower
14 enrolment and completion of education among scheduled castes and scheduled tribes due to
15 various factors [30,31]. Religion captures self-reported follower/believer of Hinduism, Islam,
16 Christianity and others (which mainly include Sikhs, Jains, Buddhists and non-believers). The
17 study also considered place of residence as rural and urban as well as all 29 states and three
18 UTs in the analysis.

25
26
27
28
29
30
31
32
33
34

35 36 *Analytical strategy* 37

38
39 At first, prevalence of areca nut consumption with and without tobacco at national and sub-
40 national levels along with rural-urban and male-female differences was analyzed. Chi-
41 squared (χ^2) tests were performed to examine whether variations in areca nut consumption
42 across independent variables were statistically significant. To examine the associated
43 between areca nut consumption with various socioeconomic and demographic characteristics,
44 multinomial logistic regression was used. In the multinomial logit regression, it is assumed
45 that log odds of outcome/dependent variable either follow linear form or non-binary form;
46 each outcome/dependent variable is modelled relative to the baseline group or outcome[32].
47
48 In this study, we have considered (i) 'non-areca nut user (baseline group)', (ii) 'areca nut
49 consumption only with tobacco', (iii) areca nut consumption only without tobacco' and (iv)
50
51
52
53
54
55
56
57
58
59
60

1
2
3 'areca nut consumption with and without tobacco, dual use'. The study reported the relative
4 risk ratio (RRR) along with 95% confidence intervals [33]. We calculated the population
5 burden based on GATS weighted sample population figures, which were provided in the
6 GATS India report[22]. The analysis was adjusted for sampling weights and multistage
7 sampling design using *svy* command in STATA. Analysis was carried out in STATA, version
8
9
10
11
12
13
14
15 [34]

16 17 *Ethics statement*

18
19
20 The second round of GATS obtained ethical clearance from the Ethics Committee of Tata
21 Institute of Social Sciences[22]. No ethics clearance was required for this study, as we
22 performed a secondary analysis using publicly available data.
23
24
25
26

27 28 *Patient and public involvement*

29
30 No patients were involved in the development of the research question, the outcome measures
31 or the design of the study.
32
33
34

35 36 **Results**

37 38 *Descriptive statistics*

39
40 Of the 74037 respondents, 40265 (48.9%) were women and 33772 (51.1%) were men, and
41 47549 (65.5%) individuals resided in rural areas. One out of four respondents had no formal
42 education and nearly 78% were aware about the adverse health effects of SLT consumption
43
44
45
46
47
48 **(Supplementary table 1).**

49
50 We found that overall, betel quid without tobacco (8.7%; 95%CI 6.7-10.2) was consumed
51 largely, followed by areca nut of any type (8%; 95%CI 5.9-10.3) at the national level (**Table**

1
2
3 without tobacco and areca nut of any type were largely consumed, while in the rural areas it
4 was mainly betel quid without tobacco. Regional pattern suggests that betel quid with tobacco
5 were predominately consumed in many north-eastern states, while betel quid without tobacco
6 was mainly used in south (**Supplementary table 2**).

Regional disparity in areca nut consumption

15 We found 23.9 (95%CI 23.1-24.8) adults were consuming areca nut at national level and
16 14.2% (95%CI 13.6-14.9) were consuming areca nut without tobacco (**Table 2**). **Figure 1**
17 shows considerable variations in areca nut consumption across states and UTs of India. In
18 many states areca nut consumption in any form was over 40% among men (like, Uttar
19 Pradesh, Assam Meghalaya, Mizoram, and Manipur) and women (like, Karnataka, and all
20 north-eastern states except Nagaland). Areca nut consumption without tobacco was largely
21 being consumed across north-eastern states, apart from other bigger states like Karnataka
22 (28.8%; 95%CI 25.6-32.1), Tamil Nadu (25.5%; 95%CI 21.9-29.5) and Maharashtra (20%;
23 95%CI 17.0-22.5). Nearly 223.4 million people out of the total 932,488,000 population aged
24 15 and above consume areca nut in India (**Table 3**). The distribution of areca nut users both
25 in terms of population and proportion across states were as follows: Uttar Pradesh with 49.9
26 million users contributes to nearly 22% of all areca nut users, followed by Maharashtra with
27 26.7 million users (12%), Karnataka with 19.8 million (9%) and Tamil Nadu with 17.7
28 million users (8%). Together, these four states share nearly 51% of all areca nut users in the
29 country. Not much difference exists between urban and rural areas in areca nut usage patterns
30 (**Supplementary table 3**). In 18 states/UTs, however, areca nut consumption was higher in
31 urban areas than rural counterparts. In 13 states/UTs, the opposite pattern was evident.

Demographic and socioeconomic differences in areca nut consumption

1
2
3 Consumption of areca nut in any form was higher among males as compared to females both
4 at national level as well as in a majority of states (**Supplementary table 4**). All forms of
5 areca nut consumption were higher in the age group 31-50 years (**Table 4**) as compared with
6 other age categories. 28.8% men (95%CI 27.7-30.0) and 27.1% widowed/separated/divorced
7 (95%CI 25.3-29.1) were consuming areca nut. Individuals who had completed below the
8 primary level of schooling consumed higher proportion of areca nut. Areca nut consumption
9 was highest among daily wage labourers (30.2%; 95%CI 28.7-31.7). We found that a high
10 percentage of Scheduled Tribes (25.6%; 95%CI 23.0-27.5) and Muslims (30.8%; 95%CI
11 28.4-33.2) were consuming areca nut.

22

Determinants of areca nut consumption: regression analysis

23
24
25
26
27 Regression results suggest that as compared to 15-18 age group, the likelihood of areca nut
28 consumption with tobacco and dual use was higher in higher age groups (**Table 5**); except
29 that areca nut consumption without tobacco was lower among the age group 51 and above, as
30 compared to the 15-18 age groups. Probability of areca nut consumption was higher among
31 males as compared to females for all three forms. The likelihood of areca nut consumption
32 without tobacco was higher across all the educational categories as compared to those who
33 had no formal education. However, the probability of areca nut consumption with tobacco
34 and in dual-form was declining with increase in the education level of respondents. The
35 likelihood of areca nut consumption with tobacco and dual-use was significantly higher
36 among Schedules Castes than Other castes. Probability of all the three forms of areca nut
37 consumption was higher among Muslims as compared to Hindus.

Discussion

52
53
54
55
56 The findings of the study revealed that nearly one out of every four adults in India consumes
57 areca nut, that is, almost 223.79 million users, making areca nut consumption a bigger public
58
59
60

1
2
3 health challenge than use of smokeless tobacco (199 million users) in dealing with substance
4 use and addiction in the country. The large number of users of areca nut, a known carcinogen
5 presents a huge public health challenge for the country. Moreover, nearly 10% consume areca
6 nut with tobacco. Thus, considering the wide range of adverse health impacts, effective
7 implementation on banning of tobacco as an ingredient with areca nut products under
8 regulation 2.3.4 of the Food Safety and Standards Regulation, 2011 and ban on manufacture
9 and sale of areca nut products, as implemented in some of the states, is urgently needed [1].

10
11 We found considerable regional and socioeconomic differences in the consumption of areca
12 nut. In four states, Meghalaya, Assam, Mizoram and Manipur, over half of the population
13 consume areca nut. Further, Karnataka, Uttar Pradesh, Tamil Nadu, Maharashtra and Odisha,
14 constitute nearly 55% of the country's areca nut users. As far as other determinants are
15 concerned, the findings confirmed that age, gender, marital status, education, occupation,
16 castes and religion are significantly associated with areca nut consumption. However, the
17 direction of association differs with respect to areca nut consumption with and without
18 tobacco. Cheaper and abundant availability, due to large scale domestic production of areca
19 nut could be one of the key reasons for such high prevalence in the country.

20
21 We found protective effect of secondary and above level education in the case of areca nut
22 consumption with and without tobacco. A study from Pakistan also observed that the
23 consumption of areca nut users increased by grade among school children aged 4 to 16 years
24 [27]. Areca nut consumption were higher among male than among female, a finding that is
25 consistent with other studies conducted in Tamil Nadu and Assam in India [26,35] and
26 countries like Thailand and Taiwan [13]. It may be because areca nut consumption results in
27 staining of teethe which may not be liked by young and adult females. The age-wise pattern
28 suggests that areca nut consumption without tobacco began to decline from age 51 onwards.

1
2
3 But in the case of areca nut consumption with tobacco and in both forms, it increased with
4
5 age.
6
7

8 Similar to other studies from India and other neighbouring countries [24,36], we also
9
10 observed higher consumption of areca nut with tobacco among daily wage/casual labourers.
11
12 This study further adds that areca nut consumption without tobacco too was largely
13
14 consumed by daily wage/casual labourers, followed by non-government sector. Evidences
15
16 suggests that many misconceptions including consuming areca nut improves concentration,
17
18 pleasure, helps in anxiety and muscle relaxation and suppresses appetite increases the
19
20 likelihood of consumption among those who are engaged in casual labour and have long
21
22 working hours [23,37,38]. We found higher consumption of areca nut among STs and SCs
23
24 than other caste groups. Further, Muslims were more likely to consume all three forms of
25
26 areca nut as compared with Hindus. Previous studies documented higher consumption of
27
28 tobacco including SLT, among SCs/STs and Muslims [25,39].
29
30
31
32
33

34 Urban-rural differences by state suggest that in 18 states, areca nut consumption was higher
35
36 in urban areas than in rural areas. Regression results also revealed higher consumption of
37
38 areca nut without tobacco in urban areas than rural counterparts. This is likely due to higher
39
40 awareness about harms related to tobacco use in urban areas than rural counterparts. Studies
41
42 from India and Pakistan documented that *pan masala* and *gutka* are very popular even in
43
44 urban areas due to aggressive advertising, targeting middle class and adolescents, which
45
46 improved sale many tobacco and related products including areca nut [40].
47
48
49

50 Our study had some limitations. Information related to areca nut consumption in different
51
52 forms in the GATS was based on respondents self-reporting. Thus, the study cannot rule out
53
54 social desirability bias – a tendency among some people to respond to questions in a way
55
56 which they deem to be more acceptable than would be their ‘correct’ answer [41]. The
57
58 nomenclature of various areca nut products in geographically diverse country like India could
59
60

1
2
3 be a source of concern, which is difficult to capture in the large scale surveys. Considering
4
5 the cross-sectional design of the survey, we did not examine the cause and effect relationship
6
7 between socioeconomic characteristics and areca nut consumption. Similarly, the available
8
9 data did not allow us to estimate trends of areca nut usage over time, but future analyses of
10
11 repeated GATS may inform on important trends. Another limitation is that the study is based
12
13 on 15 years and older population, whereas the areca nut habits often start at younger age. The
14
15 future Global Youth Tobacco Survey (GYTS) should have areca nut related questions similar
16
17 to GATS so that detailed usage pattern of areca nut could be examined among younger
18
19 population of the country.
20
21
22

23 24 **Conclusion**

25
26
27 It is now well established that areca nut consumption in any form is highly addictive, a well-
28
29 known risk factor for oral, pharynx and oesophageal cancers and is associated with many
30
31 adverse health effects. This study adds to the existing knowledge that areca nut consumption
32
33 in India was much higher than the overall smokeless tobacco. Moreover, a significant
34
35 proportion of areca nut was consumed along with tobacco, which elevates the adverse health
36
37 impacts and co-morbidities further. Thus, it calls for urgent policy intervention to prevent
38
39 both new generations from taking up areca nut consumption habit and helping current users
40
41 to quit. Such policy efforts to control areca nut consumption should be guided by the huge
42
43 differences in its consumption across states, gender and socioeconomic groups in India.
44
45 Unlike tobacco, for which the WHO FCTC provides evidence-based policies, no global
46
47 policy exists for the regulation and control of areca nut consumption and its cessation. Also,
48
49 there is a need for further research and population-based interventions to find treatment for
50
51 areca nut dependence. In addition, research is needed to examine the intention to quit among
52
53 areca nut users, separately for all three categories - those who consumption areca nut with
54
55 tobacco, without tobacco and those who consume in both the forms, to develop an
56
57
58
59
60

1
2
3 appropriate intervention model for cessation. This information may be collected within the
4
5 GATS survey by adding a few additional questions on areca nut for future analysis. Given
6
7 that areca nut consumption follows a complex pattern by SES and regional trajectories,
8
9 separately for with and without tobacco, future research is needed to explore the various
10
11 intersections between SES and areca nut consumption in different regions of India to gain
12
13 better clarity.

STROBE Statement—checklist of items that should be included in reports of observational studies

	Item No	Recommendation	Page No
Title and abstract	2	(a) Indicate the study's design with a commonly used term in the title or the abstract (b) Provide in the abstract an informative and balanced summary of what was done and what was found	2
Introduction			
Background/rationale	5	Explain the scientific background and rationale for the investigation being reported	5-6
Objectives	6	State specific objectives, including any prespecified hypotheses	6
Methods			
Study design	6	Present key elements of study design early in the paper	6-7
Setting	6	Describe the setting, locations, and relevant dates, including periods of recruitment, exposure, follow-up, and data collection	6-7
Participants	6	(a) <i>Cohort study</i> —Give the eligibility criteria, and the sources and methods of selection of participants. Describe methods of follow-up <i>Case-control study</i> —Give the eligibility criteria, and the sources and methods of case ascertainment and control selection. Give the rationale for the choice of cases and controls <i>Cross-sectional study</i> —Give the eligibility criteria, and the sources and methods of selection of participants (b) <i>Cohort study</i> —For matched studies, give matching criteria and number of exposed and unexposed <i>Case-control study</i> —For matched studies, give matching criteria and the number of controls per case	
Variables	7	Clearly define all outcomes, exposures, predictors, potential confounders, and effect modifiers. Give diagnostic criteria, if applicable	7-9
Data sources/ measurement	6	For each variable of interest, give sources of data and details of methods of assessment (measurement). Describe comparability of assessment methods if there is more than one group	7-9
Bias	8	Describe any efforts to address potential sources of bias	6
Study size	9	Explain how the study size was arrived at	6
Quantitative variables	8	Explain how quantitative variables were handled in the analyses. If applicable, describe which groupings were chosen and why	9-10
Statistical methods	9-10	(a) Describe all statistical methods, including those used to control for confounding (b) Describe any methods used to examine subgroups and interactions (c) Explain how missing data were addressed (d) <i>Cohort study</i> —If applicable, explain how loss to follow-up was addressed <i>Case-control study</i> —If applicable, explain how matching of cases and controls was addressed <i>Cross-sectional study</i> —If applicable, describe analytical methods taking account of sampling strategy (e) Describe any sensitivity analyses	9-10 10-10 6

For peer review only

Results			Page no
Participants	13*	(a) Report numbers of individuals at each stage of study—eg numbers potentially eligible, examined for eligibility, confirmed eligible, included in the study, completing follow-up, and analysed (b) Give reasons for non-participation at each stage (c) Consider use of a flow diagram	12
Descriptive data	14*	(a) Give characteristics of study participants (eg demographic, clinical, social) and information on exposures and potential confounders (b) Indicate number of participants with missing data for each variable of interest (c) <i>Cohort study</i> —Summarise follow-up time (eg, average and total amount)	12
Outcome data	15*	<i>Cohort study</i> —Report numbers of outcome events or summary measures over time <i>Case-control study</i> —Report numbers in each exposure category, or summary measures of exposure <i>Cross-sectional study</i> —Report numbers of outcome events or summary measures	12-14
Main results	16	(a) Give unadjusted estimates and, if applicable, confounder-adjusted estimates and their precision (eg, 95% confidence interval). Make clear which confounders were adjusted for and why they were included (b) Report category boundaries when continuous variables were categorized (c) If relevant, consider translating estimates of relative risk into absolute risk for a meaningful time period	12-14
Other analyses	17	Report other analyses done—eg analyses of subgroups and interactions, and sensitivity analyses	N.A.
Discussion			
Key results	18	Summarise key results with reference to study objectives	14
Limitations	19	Discuss limitations of the study, taking into account sources of potential bias or imprecision. Discuss both direction and magnitude of any potential bias	18
Interpretation	20	Give a cautious overall interpretation of results considering objectives, limitations, multiplicity of analyses, results from similar studies, and other relevant evidence	14-18
Generalisability	21	Discuss the generalisability (external validity) of the study results	19
Other information			
Funding	22	Give the source of funding and the role of the funders for the present study and, if applicable, for the original study on which the present article is based	19

*Give information separately for cases and controls in case-control studies and, if applicable, for exposed and unexposed groups in cohort and cross-sectional studies.

Note: An Explanation and Elaboration article discusses each checklist item and gives methodological background and published examples of transparent reporting. The STROBE checklist is best used in conjunction with this article (freely available on the Web sites of PLoS Medicine at <http://www.plosmedicine.org/>, Annals of Internal Medicine at <http://www.annals.org/>, and Epidemiology at <http://www.epidem.com/>). Information on the STROBE Initiative is available at www.strobe-statement.org.
