AOR, adjusted odds ratio; CI, confidence interval; OR, odds ratio.

<sup>a</sup>Estimates are proportions of antibody-positive persons out of those tested weighted by sex, age, and nationality.

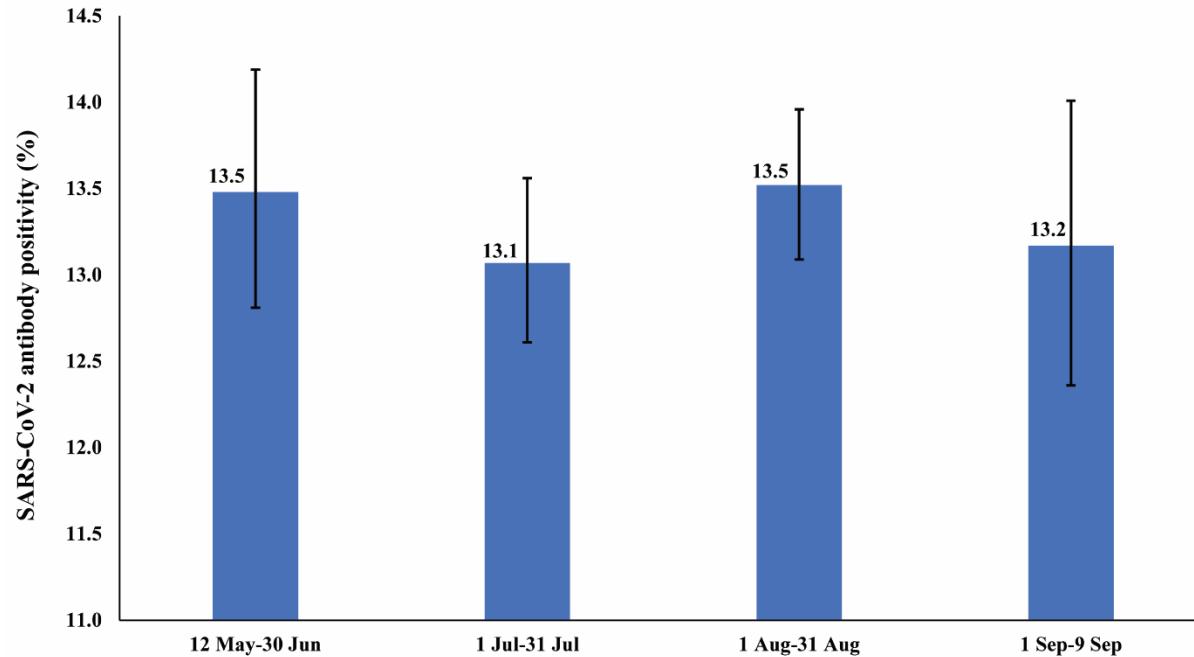

<sup>b</sup>Covariates with p-value ≤0.2 in the univariable analysis were included in the multivariable analysis.

<sup>c</sup>Covariates with p-value ≤0.05 in the multivariable analysis were considered strong predictors of anti-SARS-CoV-2 positivity after adjustment for sex, age, nationality, clinical-care encounter type, and antibody test date.

<sup>d</sup>These include other nationalities residing in Qatar.

<sup>e</sup>This category was chosen as a reference given the larger sample size and because of the progressive easing of the social and physical distancing restrictions since June 15, 2020 [21].

**Figure S1.** Trend of SARS-CoV-2 antibody positivity month-by-month. Error bars indicate 95% confidence intervals.

<sup>a</sup>Tests for the months of May and June were combined given the low number of tests in May.

**Table S3.** Associations for having a higher antibody titer (optical density) than the median value ( $\geq 27.0$ ) among 18,844 antibody-positive individuals, where antibody test date has been included as a categorical term.

| Characteristics                      | Tested        | Higher antibody titers than the median |                     | Univariable regression analysis |                          | F test | Multivariable regression analysis |                      |

AOR, adjusted odds ratio; CI, confidence interval; OR, odds ratio.

<sup>a</sup>Estimates are proportions of persons with antibody titers higher than the median among those antibody-positive, weighted by sex, age, and nationality.

<sup>b</sup>Covariates with p-value ≤0.2 in the univariable analysis were included in the multivariable analysis.

<sup>c</sup>Covariates with p-value ≤0.05 in the multivariable analysis were considered strong predictors of anti-SARS-CoV-2 positivity after adjustment for age, nationality, clinical-care encounter type, and antibody test date.

<sup>d</sup>The 20-29 age group was chosen as the reference group (instead of the <10 age group) because of the larger sample size and for epidemiological relevance.

<sup>e</sup>These include other nationalities residing in Qatar.
