

Supplementary Figure S8. Growth factors and cell proliferation gene expression levels in different treatment groups after 2 h treatment. Gene expression data was derived from RNA-Sequencing analysis described in [Supplementary Fig. S3](#). Each bar represents means \pm SEM of gene expression levels of control (Ctrl), FSH18/21, or FSH24 group. Each group contained 3 to 4 animals. * $P < 0.05$; ** $P < 0.01$.
