Supplementary Methods

General reagent information. Solvents were either purified and dried by passage through alumina and Q5 reactant-packed columns on a solvent purification system or bought from the commercial sources and transferred to the glovebox without exposure to air. Other commercial reagents were purchased from Sigma-Aldrich, Acros, Alfa Aesar, TCI, Aladdin, J&K, Energy Chemical, Bide Pharmatech Ltd. and were used as received. Flash chromatography was performed using glass columns with silica gel (*SiliaFlash*® P60, particle size 40-63 μm, Silicycle).

$NiBr_2$·diglyme (CAS 312696-09-6) was purchased from Sigma-Aldrich;
NiI_2·xH_2O (CAS 7790-34-3) was purchased from Strem Chemical;
Na_2CO_3 (CAS 497-19-8) was purchased from Alfa Aesar;
K_3PO_4·H_2O (CAS 27176-10-9) was purchased from Sigma-Aldrich;
NaI (CAS 7681-82-5) was purchased from Alfa Aesar (ACS, 99.0% min.);
DME (CAS 110-71-4, 99.9%, extra dry, with molecular sieves, water≤30 ppm (by K.F.), EnergySeal) was purchased from Energy Chemical;
Benzotrifluoride ($PhCF_3$, CAS 98-08-8, 99%, SuperDry, water≤10 ppm, J&K Seal) was purchased from J&K;
Diglyme (CAS 111-96-6, 99.5%, SuperDry, J&K Seal) was purchased from J&K;
Bathocuproine (CAS 4733-39-5) was purchased from Energy Chemical;
4-Phenyl-1-butene (CAS 768-56-9) was purchased from TCI;
PMHS (CAS 63148-57-2, poly(methylhydrosiloxane)) was purchased from Sigma-Aldrich and stored under nitrogen at –20 °C in glove box;
$(MeO)_3SiH$ (CAS 2487-90-3) was purchased from Energy Chemical and stored under nitrogen at –20 °C in glove box;

Safety note: MSDS indicates that $(MeO)_3SiH$ is a corrosive and flammable liquid. According to the literatures[1,2], it may form pyrophoric gas (possibly SiH_4) during the storage or reaction. Although during our reaction, we used $(MeO)_3SiH$ without incident and SiH_4 was not observed, we urge the users of these procedures to be alert to the possibility of SiH_4 formation and possible exotherms and to take suitable precautions (suitable eye protection is also required).

General analytical information. All compounds (starting materials and products) were characterized by ^1H NMR, ^{13}C NMR, IR spectroscopy and high-resolution mass spectrometry. ^1H NMR spectra were recorded on Bruker 500 MHz spectrometer and are referenced relative to residual $CDCl_3$ proton signals at δ 7.26 ppm. ^{19}F NMR spectra were recorded on a Bruker 500 MHz spectrometer and are referenced to $CFCl_3$ (δ 0.0

ppm). Data for ^{1}H and ^{19}F NMR are reported as follows: chemical shift (δ ppm), multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, br = broad), integration, and coupling constant (Hz). ^{13}C NMR spectra were recorded on a Bruker 500 MHz spectrometer and are referenced to $CDCl_3$ at δ 77.16 ppm. The ^{13}C NMR spectra were obtained with ^{1}H decoupling. Data for ^{13}C NMR are reported in terms of chemical shift and multiplicity where appropriate. IR spectra were obtained on a Bruker Alpha and was reported in terms of frequency of absorption (cm^{-1}). GC analyses were performed on Agilent 7890 or 8890 gas chromatograph with an FID detector using a J&W DB-1 column (10 m, 0.1 mm I.D.). Low Resolution Mass spectra were obtained from on an Agilent 5977A GC-MS. r.r. refers to regioisomeric ratio, representing the ratio of the terminal coupling product to the sum of all other isomers as determined by GC and GC-MS analysis. High Resolution Mass spectra were obtained from on an Agilent 6540 Q-TOF mass spectrometer, operating electrospray ionization (ESI) mode. High pressure liquid chromatography (HPLC) was performed on Agilent 1260 Series chromatographs using Daicel Chiralcel columns (250 mm). Optical rotations were measured on a Rudolph Research Analytical Autopol VI automatic polarimeter using a 50 mm pathlength cell at 589 nm with $[\alpha]_D$ values reported in degrees; concentration (c) is in g/100 mL.

Medium-sized screw-cap test tubes (8 mL) were used for all 0.20 mmol scale reactions:

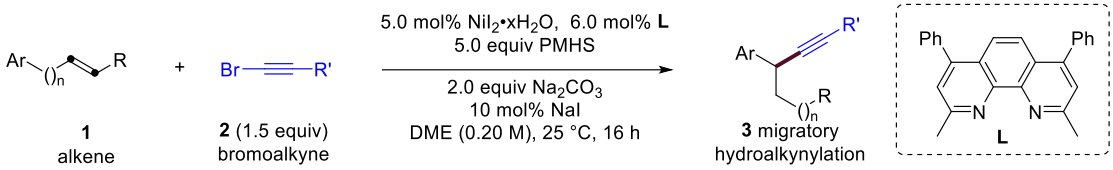
NiH-Catalyzed Reductive Migratory Hydroalkynylation



<u>General procedure (A)</u> for NiH-catalyzed reductive migratory hydroalkynylation.

In a nitrogen-filled glove box, to an oven-dried 8 mL screw-cap vial equipped with a magnetic stir bar were added $NiI_2 \cdot xH_2O$ (3.8 mg, 5.0 mol%), **L** (4.3 mg, 6.0 mol%), Na_2CO_3 (42.4 mg, 2.0 equiv), NaI (3.0 mg, 10.0 mol%) and anhydrous DME (1.0 mL). The mixture was stirred for 20 min at room temperature (stirred at 800 rpm) before the addition of PMHS (60 μL, 1.0 mmol, 5.0 equiv). Stirring was continued for an additional 5 min at room temperature before the addition of olefin **1** (0.20 mmol, 1.0 equiv) and bromoalkyne **2** (0.30 mmol, 1.5 equiv). The tube was sealed with a teflon-lined screw cap, removed from the glove box and the reaction was stirred at 25 °C for up to 16 h (the mixture was stirred at 1000 rpm). After the reaction was complete, the reaction was quenched upon the addition of H_2O, and the mixture was extracted with EtOAc. The organic layer was concentrated to give the crude product. Dodecane (20 μL) was added as an internal standard for GC analysis. The product was purified by flash column chromatography (petroleum ether/EtOAc) for each substrate. The yields reported are the average of at least two experiments, unless otherwise indicated.

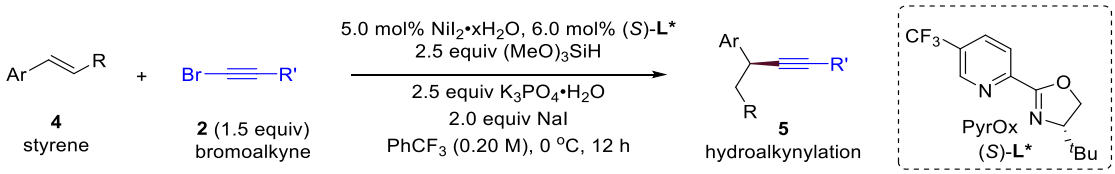
Enantioselective NiH-Catalyzed Reductive Hydroalkynylation.



<u>General procedure (B)</u> for enantioselective NiH-catalyzed reductive hydroalkynylation. In a nitrogen-filled glove box, to an oven-dried 8 mL screw-cap vial equipped with a magnetic stir bar were added $NiI_2 \cdot xH_2O$ (3.8 mg, 5.0 mol%), (*S*)-**L*** (3.3 mg, 6.0 mol%), $K_3PO_4 \cdot H_2O$ (115.1 mg, 2.5 equiv), NaI (60.0 mg, 2.0 equiv) and anhydrous $PhCF_3$ (1.0 mL). The mixture was stirred for 20 min at room temperature (stirred at 800 rpm) before the addition of $(MeO)_3SiH$ (64 μL, 0.50 mmol, 2.5 equiv). Stirring was continued for an additional 5 min at room temperature before the addition of olefin **4** (0.20 mmol, 1.0 equiv) and bromoalkyne **2** (0.30 mmol, 1.5 equiv). The tube was sealed with a teflon-lined screw cap, removed from the glove box and the reaction was stirred at 0 °C for up to 12 h (the mixture was stirred at 800 rpm). After the reaction was complete, the reaction was quenched upon the addition of H_2O, and the mixture was extracted with EtOAc. The organic layer was concentrated to give the crude product. Dodecane (20 μL) was added as an internal standard for GC analysis. The product was purified by flash column chromatography (petroleum ether/EtOAc) for each substrate. The yields reported are the average of at least two experiments, unless otherwise indicated. The enantiomeric excesses (% ee) of the corresponding products were determined by HPLC analysis using chiral stationary phases.

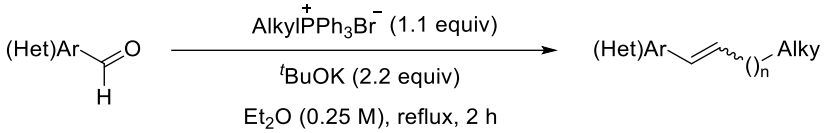
General procedure (C) for the synthesis of olefins 1d', 4c, and 4q



A flame dried 250 round bottom flask was charged with alkyl triphenyl phosphonium bromide (1.1 equiv), KO^{t}Bu (2.2 equiv, ***Note: hydroscopic, stored under nitrogen. Exposure to air should be less than 5 minutes***), a stir bar, and anhydrous diethyl ether (0.25 M). A reflux condense was attached and the reaction mixture was heated to reflux for over 1 h before adding a solution of aldehyde (1.0 equiv) in anhydrous diethyl ether. The reaction was monitored by TLC and upon completion of the reaction (~ 2 h), the solvent was removed in vacuo. The resulting compound was diluted with hexanes, filtered over a thick plug of silica gel and concentrated again. The reaction was purified via column chromatography to get the desired compound.

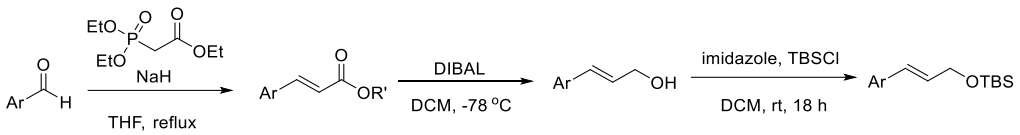
General procedure (D) for the preparation of olefins 1f', 4h and **4r**[3,4]



Step 1:

Phosphonoacetate (1.2 equiv) was added dropwise under argon over a period of 5 minutes to a stirred suspension of sodium hydride (55% dispersion in oil, 1.2 equiv) in dry THF (1.3 mL per 1.2 mmol of sodium hydride), and the resulting mixture was stirred at 0 °C for additional 15 min. A solution of aldehyde (1.0 equiv) in dry THF (1.0 M) was slowly added to the resulting mixture, and it was stirred at 0 °C for additional 0.5 h. Subsequently, the reaction mixture was refluxed overnight and then cooled to ambient temperature, and the reaction was quenched with saturated aqueous NH_4Cl. The aqueous layer was extracted with EtOAc (30 mL × 3). The combined organic layers were washed with brine, dried over Na_2SO_4, and concentrated in vacuo. The crude product was used without further purification.

Step 2:

To a stirred solution of ethyl acrylates (1.0 equiv) in anhydrous CH_2Cl_2 (0.71 M) was added dropwise diisobutylaluminum hydride (1.0 M in toluene, 2.2 equiv) under argon at −78 °C. The mixture was stirred at −78 °C for 1.5 h, and the reaction was quenched with 10% aqueous NaOH (1.0 mL per 1.0 mL of diisobutylaluminum hydride solution). The resulting mixture was allowed to warm to ambient temperature and stirred for additional 1 h. The aqueous layer was extracted with CH_2Cl_2 (30 mL × 3), and the combined organic layers were washed with brine, dried over Na_2SO_4, and concentrated in vacuo. Purification by flash silica gel column chromatography using petroleum ether/EtOAc (v/v = 5:1–3:1) as an eluent gave the corresponding allylic alcohols.

Step 3:

In a flame-dried 25 mL round bottom flask was added allylic alcohols (1 equiv) in dry CH_2Cl_2 (0.3 M). Then imidazole (1.5 equiv) and trialkylsilyl chloride (1.3 equiv) were added. The reaction was stirred at room temperature for 18 h. The reaction was

quenched with water. The reaction was extracted with ether (2 x 15 mL). Organic layers were combined, washed with brine (20 mL), dried over magnesium sulfate, filtered and concentrated in vacuum to provide a crude oil which was purified by flash chromatography to provide the desired product.

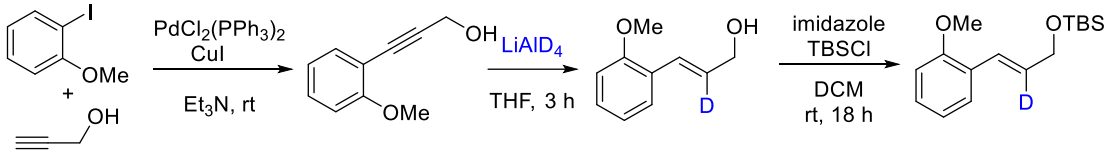
General procedure (E) for the preparation of olefin (*E*)-4h-D[4,5,6]



Step 1:

To a stirred solution of substituted iodobenzene (10 mmol, 1.0 equiv) in triethylamine (50 mL) under nitrogen were sequentially added $Pd(PPh_3)_2Cl_2$ (2 mol %) and CuI (4 mol %) at room temperature. The mixture was allowed to stir for 10 min. Then propargyl alcohol (11 mmol, 1.1 equiv) was added. The mixture was allowed to stir overnight. After the reaction was finished, water was added and the solution was extracted with ethyl acetate; The combined extract was dried with anhydrous $MgSO_4$. Solvent was removed, and the residue was separated by column chromatography to give the aryl substituted propargyl alcohol.

Step 2:

To a flame dried round-bottomed flask charged with $LiAlD_4$ (210 mg, 5 mmol, 100 mol%) under nitrogen was added THF (15 mL, 0.33 M with respect to propargylic alcohol). The reaction vessel was placed in an ice batch. After 5 minutes a solution of aryl substituted propargyl alcohol (5 mmol, 100 mol%) in dry THF (5 mL, 1.0 M with respect to propargylic alcohol) was added slowly and the mixture was stirred at room temperature for 3 hours. After the reaction vessel was placed in an ice batch, water (1 mL), NaOH (1 mL, 10% aqueous solution) and water (3 mL) were added to the reaction mixture. After 10 minutes, $MgSO_4$ was added and the reaction mixture was filtered (celite) with the aid of CH_2Cl_2 (10 mL) and the filtrate was concentrated under reduced pressure. The resulting oily residue was subjected to the next step without further purification.

Step 3:

To a flame-dried 25 mL round bottom flask was added allylic alcohol (1 equiv) in dry DCM (0.3 M). Then imidazole (1.5 equiv) and trialkylsilyl chloride (1.3 equiv) were added. The reaction was stirred at room temperature for 18 h. The reaction was quenched with water and was extracted with ether (2 x 15 mL). Organic layers were

combined, washed with brine (20 mL), dried over magnesium sulfate, filtered and concentrated in vacuum to provide a crude oil which was purified by flash chromatography to provide the desired product.

Supplementary Note 1. Spectroscopic Data (GC Traces)

1) *n*-Dodecane (t_R = 2.0 min) was used as internal standard for GC yield.

2) GC analysis was performed on Agilent 7890B gas chromatograph with an FID detector using a J & W DB-1 column (10 m, 0.1 mm I.D.). GC-MS analysis was performed on an Agilent 7890B gas chromatograph with 5977A MSD mass spectrum using an HP-5 MS column (30 m, 0.25 mm I.D.).

3) GC method: 100 method starts at 100 °C holds the oven at this temperature for 1 minute, then ramp of 50 °C/min till 250 °C and hold the oven at this temperature for 3 minutes (or 5 minutes for 100B method, or 16 minutes for 100C method).

4) rr refers to regioisomeric ratio, represents the ratio of major product to the sum of all other isomers as determined by GC, all isomers' peaks were confirmed by GC-MS analysis.
