

Table S1. Mathematical formulas for calculating all CV values:

$CV_{\text{FULL}} = (CV_{\text{FULL-EXTRACTION}}^2 + CV_{\text{FULL-SPOT}}^2)^{1/2}$
$CV_{\text{IN-TARGET}} = (CV_{\text{INTARGET-EXTRACTION}}^2 + CV_{\text{INTARGET-SPOT}}^2)^{1/2} = (CV_{\text{INTARGET-EXTRACTION}}^2 + 0)^{1/2} = CV_{\text{INTARGET-EXTRACTION}}$
$CV_{\text{TOTAL}} = (CV_{\text{EXTRACTION}}^2 + CV_{\text{MALDI}}^2)^{1/2}$
$BV_{\text{INTRA}} = (CV_{\text{TOTAL-Day1}} + CV_{\text{TOTAL-Day2}} + CV_{\text{TOTAL-Day3}}) / 3$
$BV_{\text{INTER}} = CV_{\text{TOTAL-ALLDAYS}}$

Table S2. Procedures for bacterial protein extraction

"In-Target" extraction:	"Full" extraction:
1. Spot a tiny portion of a colony in a spot	1. Suspend colony in 300 µl of H ₂ O in an Eppendorf tube.
2. Overlay it with 1µl of pure formic acid (Sigma Aldrich, Germany) and wait until drying.	2. Vortex until the suspension is completely homogeneous.
3. Apply 1µl of IVD Matrix HCCA-portioned (Bruker Daltonics, Germany) dissolved in 50% acetonitrile, 47.5% water and 2.5 % trifluoroacetic acid.	3. Add 900 µl of ethanol.
4. Measurement is performed after drying.	4. Invert the tube several times and centrifuge for 2 min at 14,000 rpm.
	5. Pipette and discard supernatant.
	6. Spin until all the remaining ethanol remains at the bottom of the tube.
	7. Pipette again to discard all ethanol and allow to dry completely (5 min).
	8. Add formic acid (AF, 70%), about ~15µl, depending on the size of the pellet. Pipette up and down until homogenized and wait for 2 min.
	5. Add the same amount of acetonitrile (ACN), pipette up and down until homogenized.
	6. Centrifuge for 2 min at 14.000 rpm.
	7. Add a drop of supernatant to the MALDI target plate.
	8. Allow to dry and add 1 µl of matrix (HCCA).

U* Unknown origin

^a Strains processed in the inter-laboratory study.

^b Isolates were screening for carbapenemase production according to the screening cut-off values recommended by EUCAST, that is having a meropenem or ertapenem MIC > 0,125 mg/L. Carbapenemase non-producing isolates *K. pneumoniae* were not genotypically characterized.

¹ Resistance gene obtained by the molecular characterization of the isolates

² Random Forest (RF) analysis

³ Results obtained with the raw spectra

⁴ Results obtained with the normalized spectra

Figure 1. RF-M_{LINEAR} features importance

The graph represents the importance of each mass peak for the result of the analysis. On the X-axis, the individual sample masses are represented and on the Y-axis the percentage of importance of each mass peak for the decision making in the allocation of each isolate into one of the categories of the analysis (OXA-48, KPC, NDM, non CPK) is represented.
