

Figure S1. Efficacy of *SNHG8* siRNA, miR-335 mimic, inhibitor, RASA1 siRNA and overexpression plasmid transfections were determined by reverse transcription-quantitative PCR. \*\*\*P<0.001 vs. Control; \*\*P<0.01 vs. NC mimic, \*\*\*P<0.001 vs. NC inhibitor; \*\*P<0.01 vs. NC siRNA, \*P<0.05 vs. NC plasmid. miR, microRNA; NC, negative control; RASA1, RAS p21 protein activator 1; siRNA, small interfering RNA; *SNHG8*, small nucleolar RNA host gene 8.

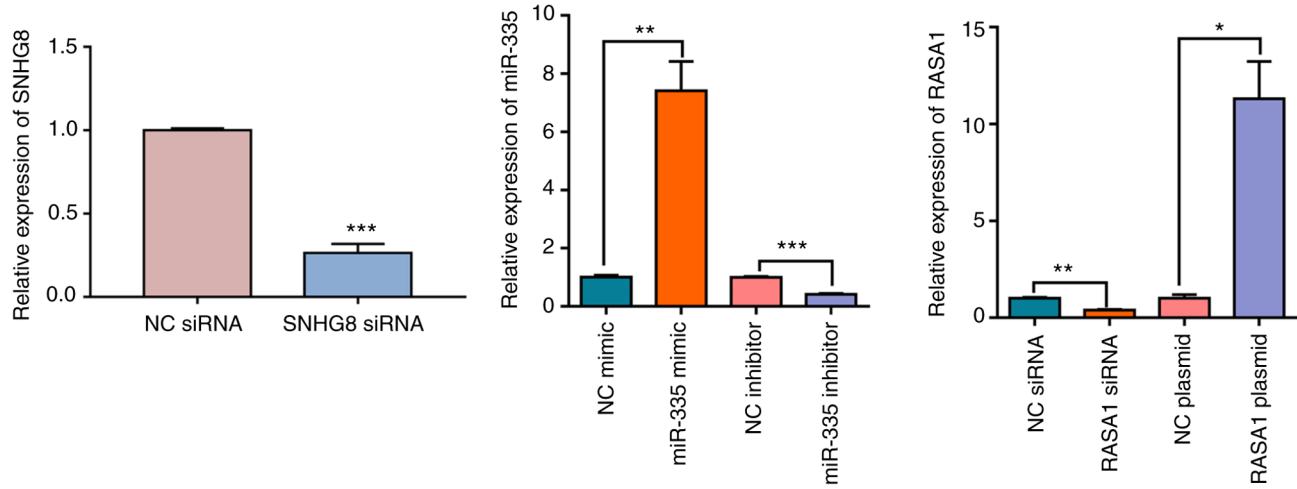

Figure S2. Expression of miR-335 was determined after HI/R induction and analyzed the relationship between miR-335 and RASA. (A) The expression of miRNAs was determined in the control and HI/R group by reverse transcription-quantitative PCR. (B) TargetScan and miRTarBase were used to screen predicted target genes of rno-miR-335. (C) Cell Counting Kit-8 assay determined cell viability in different groups. \*\*P<0.01, \*\*\*P<0.001 vs. Control. HI/R, hypoxia-ischemia-reoxygenation; miR/miRNA, microRNA; RASA1, RAS p21 protein activator 1; rno, *Rattus norvegicus*; SNHG8, small nucleolar RNA host gene 8; si, small interfering.
