

**ESM to ‘Greater daily glucose variability and lower time in range are associated with greater aortic stiffness: The Maastricht Study’**

**ESM Methods**

*Ridge regression*

The method used in R package glmnet (version 4.0.2) estimates regression coefficients according to the formula:  $Ridge = RSS + \frac{1}{n} * \lambda * \sum_{j=1}^p \beta_j^2$ , where RSS is the residual sum of squares, n is the sample size,  $\lambda$  is the chosen amount of penalization, and  $\sum_{j=1}^p \beta_j^2$  represents the sum of all squared regression coefficients.

**ESM Table 1. Participant characteristics of the different study populations and the number of missing values**

Regression coefficients (B) indicate the median difference (95% confidence interval) associated with 1 unit (mmol/L) increase of SD<sub>CGM</sub>. Standardized regression coefficients (st. $\beta$ ) indicate the median difference (95% confidence interval) associated with 1 SD higher SD<sub>CGM</sub> or MSG<sub>CGM</sub>. All coefficients were estimated by use of ridge regression. We pragmatically chose the level of penalization based on the  $\lambda$  required to reduce the variance inflation factor (VIF) of Model 2 + MSG<sub>CGM</sub> back to the VIF of Model 2 (or halfway back). Point estimates and 95% confidence intervals were calculated by use of 1,000 bootstrap estimates.

The associations were adjusted for age, sex, educational level, mean arterial pressure (\*), office systolic blood pressure (†) or brachial pulse pressure (‡), heart rate (in case of cf-PWV and ABI only), body mass index, smoking status, alcohol use, total-to-HDL cholesterol levels, use of antihypertensive and lipid-modifying drugs, and the other CGM-assessed index.

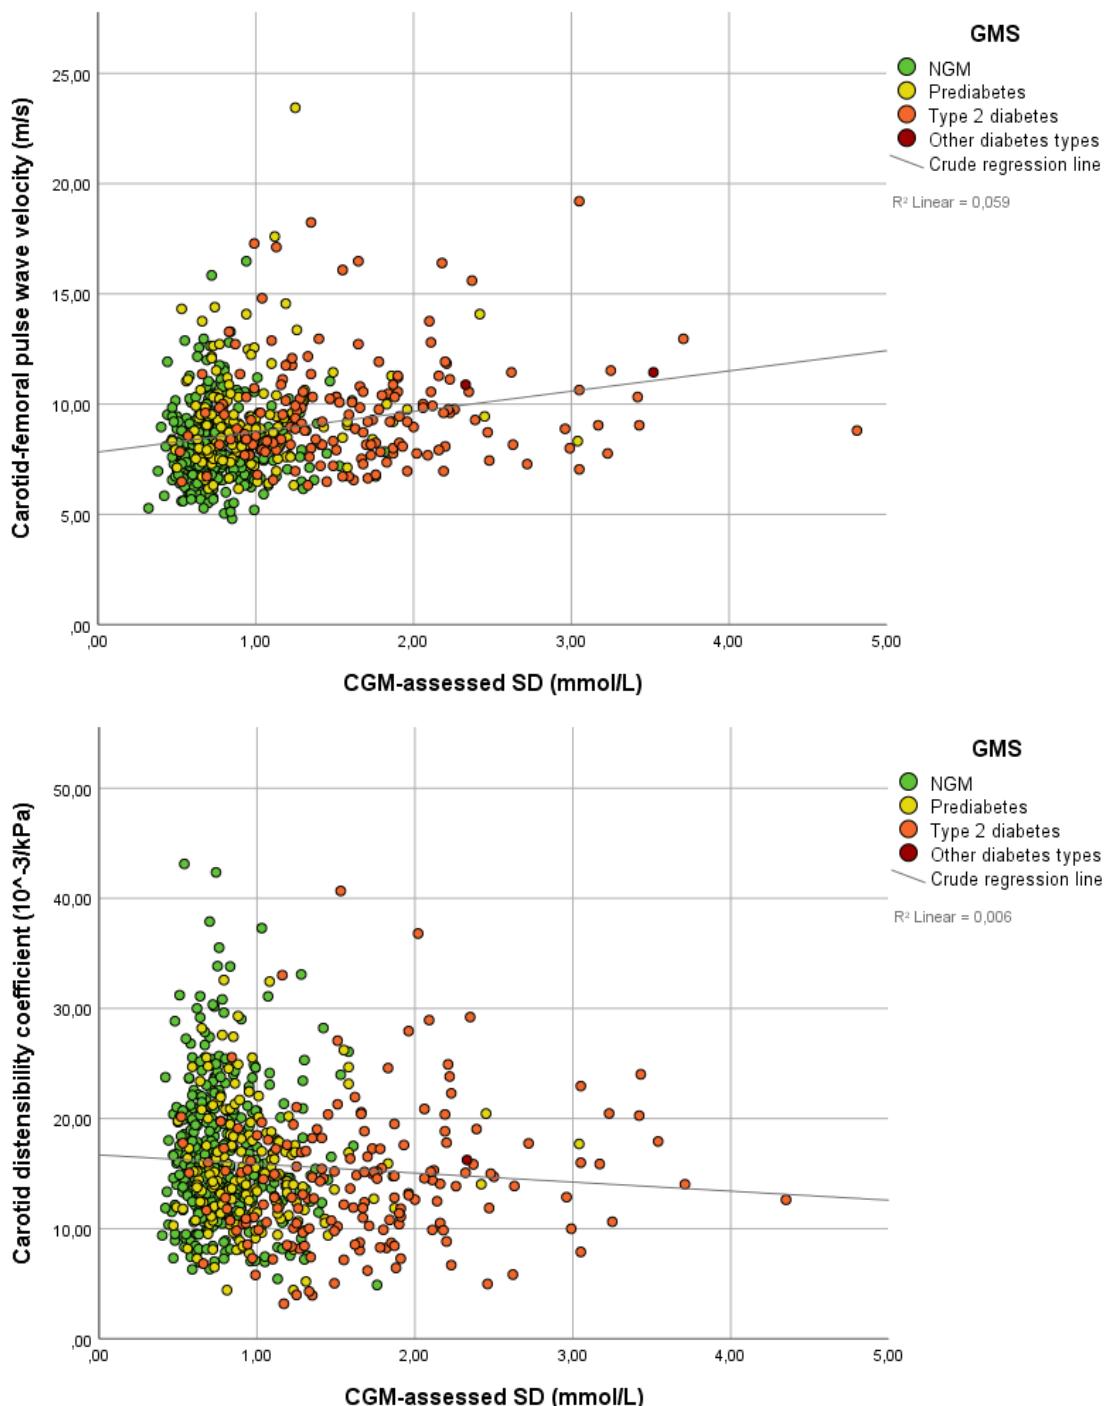

**ESM Figure 1. Flowchart delineating the derivation of the study populations**

CGM, continuous glucose monitoring; MAP, mean arterial pressure; HR, heart rate; HDL, high-density lipoprotein; cf-PWV, carotid-femoral pulse wave velocity; carDC, carotid distensibility coefficient; cIMT, carotid intima-media thickness; ABI, ankle-brachial index; CWS, circumferential wall stress.

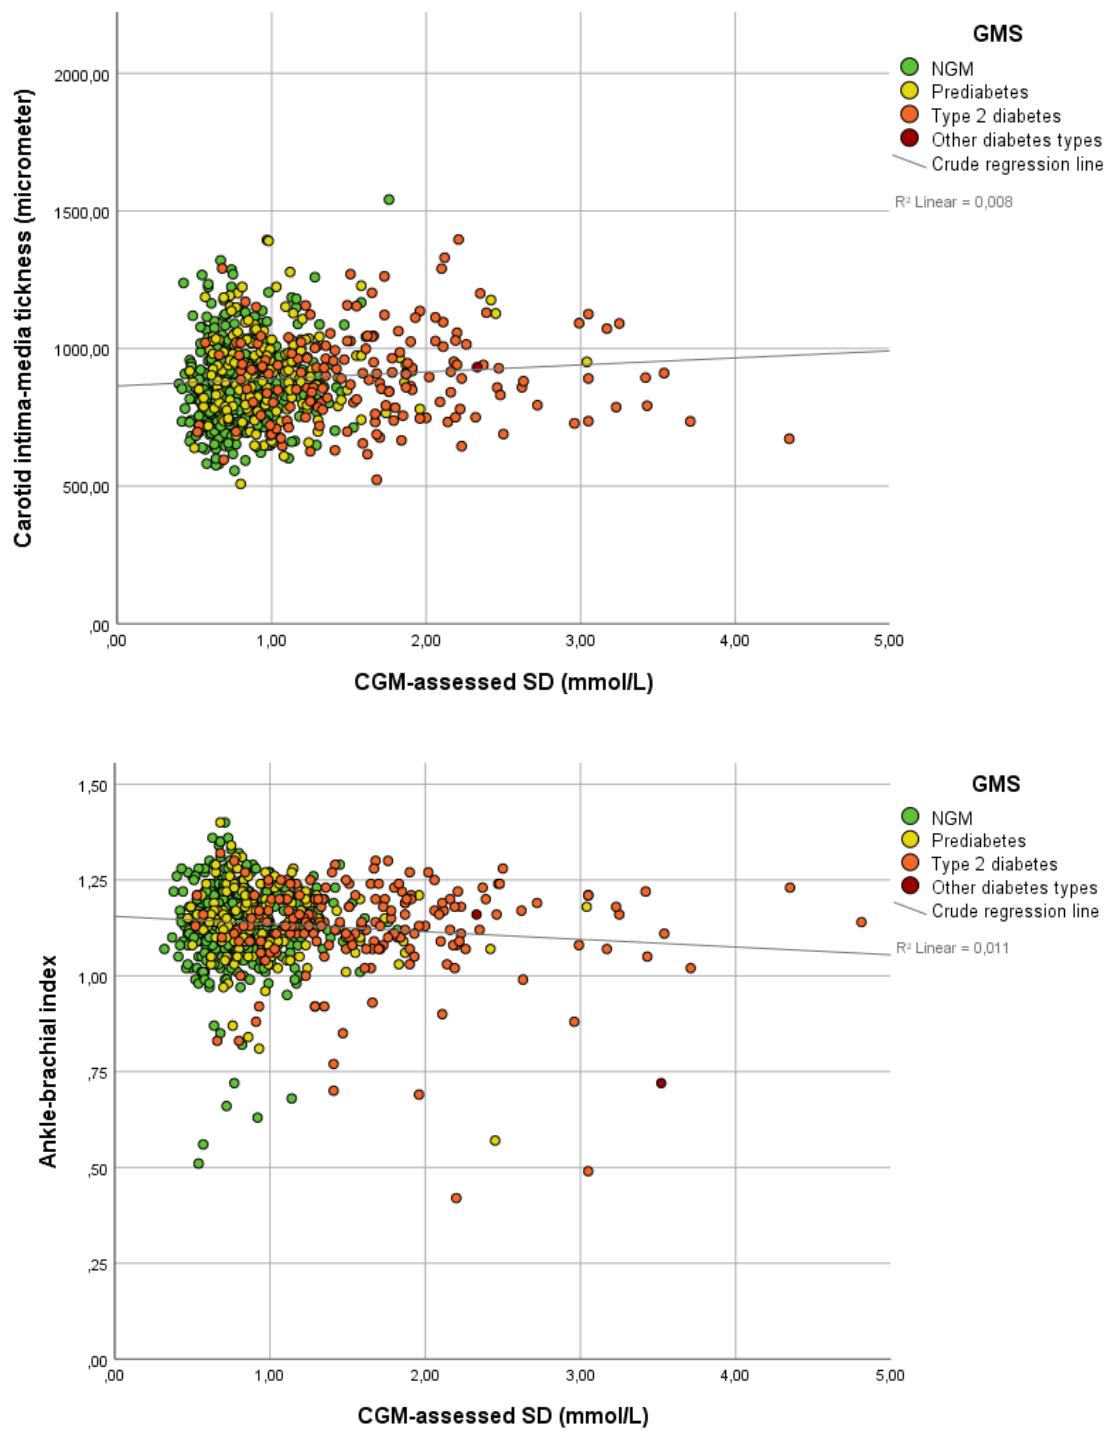

\* Not mutually exclusive.

**ESM Figure 2. GMS-highlighted scatter plots of the associations of CGM-assessed SD (SDCGM) with carotid-femoral pulse wave velocity and carotid distensibility coefficient**

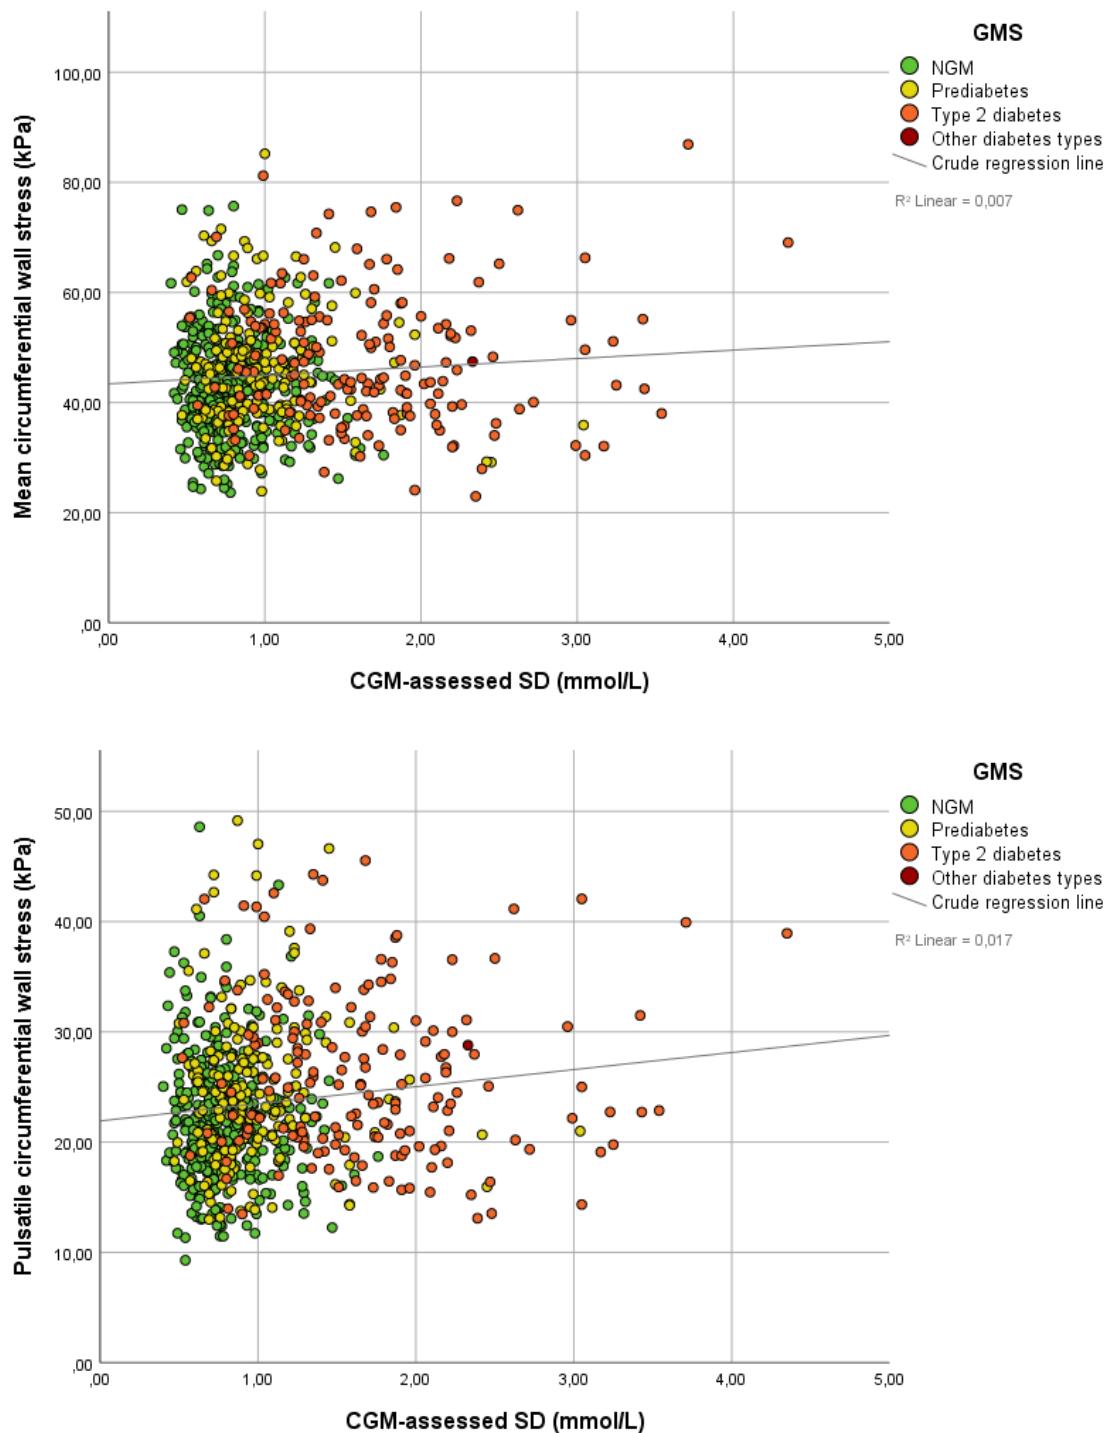

CGM, continuous glucose monitoring; SD, standard deviation; GMS, glucose metabolism status; NGM, normal glucose metabolism.

**ESM Figure 3. GMS-highlighted scatter plots of the associations of CGM-assessed SD (SDCGM) with carotid intima-media thickness and ankle-brachial index**

CGM, continuous glucose monitoring; SD, standard deviation; GMS, glucose metabolism status; NGM, normal glucose metabolism.

**ESM Figure 4. GMS-highlighted scatter plots of the associations of CGM-assessed SD (SDCGM) with mean and pulsatile circumferential wall stress**

CGM, continuous glucose monitoring; SD, standard deviation; GMS, glucose metabolism status; NGM, normal glucose metabolism.
