

Supplementary Material

Supplemental Figure S1. Tests of albicidin resistance for spontaneous mutants of *E. coli*, selected for resistance to phage T6, phage U115 or albicidin antibiotic; data are for mutants not described in the main text. **A:** Quantification of albicidin resistance (ratio of cleared zone to area of *X. albilineans* growth) showed that each mutant and the Tsx-knockout strain, BW25113 Δ tsx, were albicidin-resistant (ratio = 1.0), whereas wildtype BW25113 and positive-control BW25113 Δ icdC bacteria were

Supplementary Material

albicidin-sensitive (ratio > 1.0). **B:** In all cases, mutant growth on agar plates was not inhibited by albicidin-producing *X. albilineans* (XA23), and growth was normal on non-producer strain LS126 controls.

Supplemental Figure S2. Growth dynamics of *E. coli* mutants selected for resistance to phage T6, phage U115, or albicidin, in environments with phage T6 (dashed line), with phage U115 (dotted line), and without phages (solid line). **A-X:** In all cases, mutants grew similarly in presence/absence of phages T6 and U115, regardless of their prior selection for phage or albicidin resistance.

Supplemental Table S1. Efficiency of plaquing (EOP) for phages T6 and U115 on challenge strains of *E. coli*, selected for spontaneous resistance to each phage or to albidicin. EOP is defined as phage titer (PFU/mL) on the test strain divided by that on wildtype BW25113; EOP = 0 indicates phage growth on the challenge is below the limit of detection (<100 PFU/mL). Positive (BW25113Δ*icdC*) and negative (BW25113Δ*tsx*) controls confirm expected susceptibility and resistance to each phage in replicate ($n = 3$) assays, whereas, all 29 mutants show cross-resistance to phage infection. Statistical significance (*; $P < 0.05$) indicates result of an unpaired t-test comparing three replicate measures to the EOP on BW25113Δ*icdC*. The ‘^’ indicates a phage with observable turbid clearing of the challenge-bacteria lawn, without making visible plaques.

Efficiency of Plaquing	Phage T6	Phage U115
BW25113 Δ <i>icdC</i>	1.11 ± 0.55	1.32 ± 0.16

Supplemental Table S2. Changes to Tsx and sensitivities to phage T6, albicidin and colicin K for *E. coli* strains that were selected for resistance to phage T6 (Schneider et al., 1993) and resistance to albicidin (Fsihi et al., 1993). Missense mutations are mapped onto the crystal structure of Tsx in green in Figure 5. NA indicates data not available.

Strain	Alteration in Tsx	Selection	Sensitivity or Resistance to:			Reference
