### Table of Contents

Figure S1. ICC of cortical volume derived from original versus de-identified scans.	2
Figure S2. ICC of cortical surface area derived from original versus de-identified scans.	2
Table S1. Effects of de-identification on brain measures in children.	3
Table S2. Effects of de-identification on brain measures in young adults.	10
Table S3. Effects of de-identification on brain measures in older adults.	17
Table S4. Effects of de-identification on brain measures in older adults diagnosed with Alzheimer's disease.	24
Table S5. Effects of de-identification on brain measures in older adults without cognitive impairment.	31
Figure S3. De-identification properties and invasiveness of masks with varying coarseness.	38
Figure S4. ICC between brain measures in children derived from original scans versus scans subjected to different mask settings.	39
Figure S5. ICC between brain measures in adults derived from original scans versus scans subjected to different mask settings.	39
Table S6. Effects of de-identification on test-retest reliability in young adults: Means, coefficients of variation and t-tests	40
Table S7. Effects of de-identification on test-retest reliability in young adults: Average signed and absolute percentage differences	47
Table S8. Effects of de-identification on test-retest reliability in young adults: Pearson's correlation coefficients and intra-class correlation coefficients	53

**Figure S1. ICC of cortical volume derived from original versus de-identified scans.**

The ICC for each sample (children, young adults and older adults) is plotted on the corresponding average scan. Each column shows a different de-identification technique. Within each square, the left hemisphere (top) and the right hemisphere (bottom) are shown from an outer and medial view. The lowest ICC (0.21) was found in the right frontal pole in children using *FSL* defacing.

**Figure S2. ICC of cortical surface area derived from original versus de-identified scans.**

The ICC for each sample (children, young adults and older adults) is plotted on the corresponding average scan. Each column shows a different de-identification technique. Within each square, the left hemisphere (top) and the right hemisphere (bottom) are shown from an outer and medial view. The lowest ICC (0.61) was found in the right frontal pole in children using *FreeSurfer* defacing.

**Table S1. Effects of de-identification on brain measures in children.**

Abbreviations: SD = standard deviation; Orig = original scan; FS df = FreeSurfer defacing; FSL df = FSL defacing; FM = Face Masking; t = t-statistic; p=p-value; PD = Average Percentage Difference; CI = Confidence Interval.

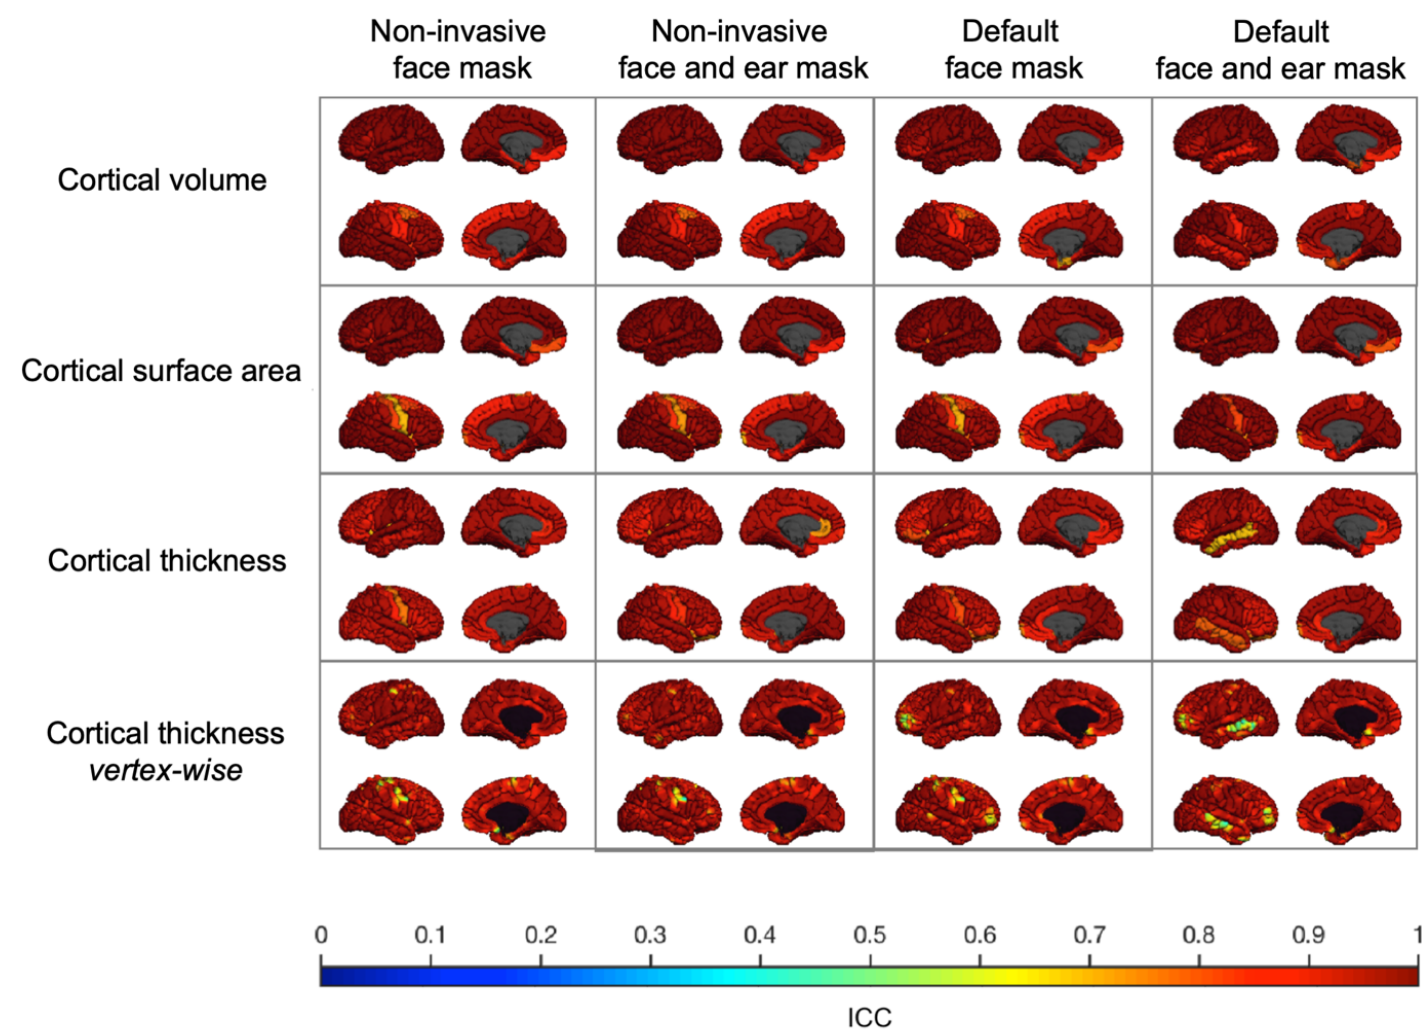

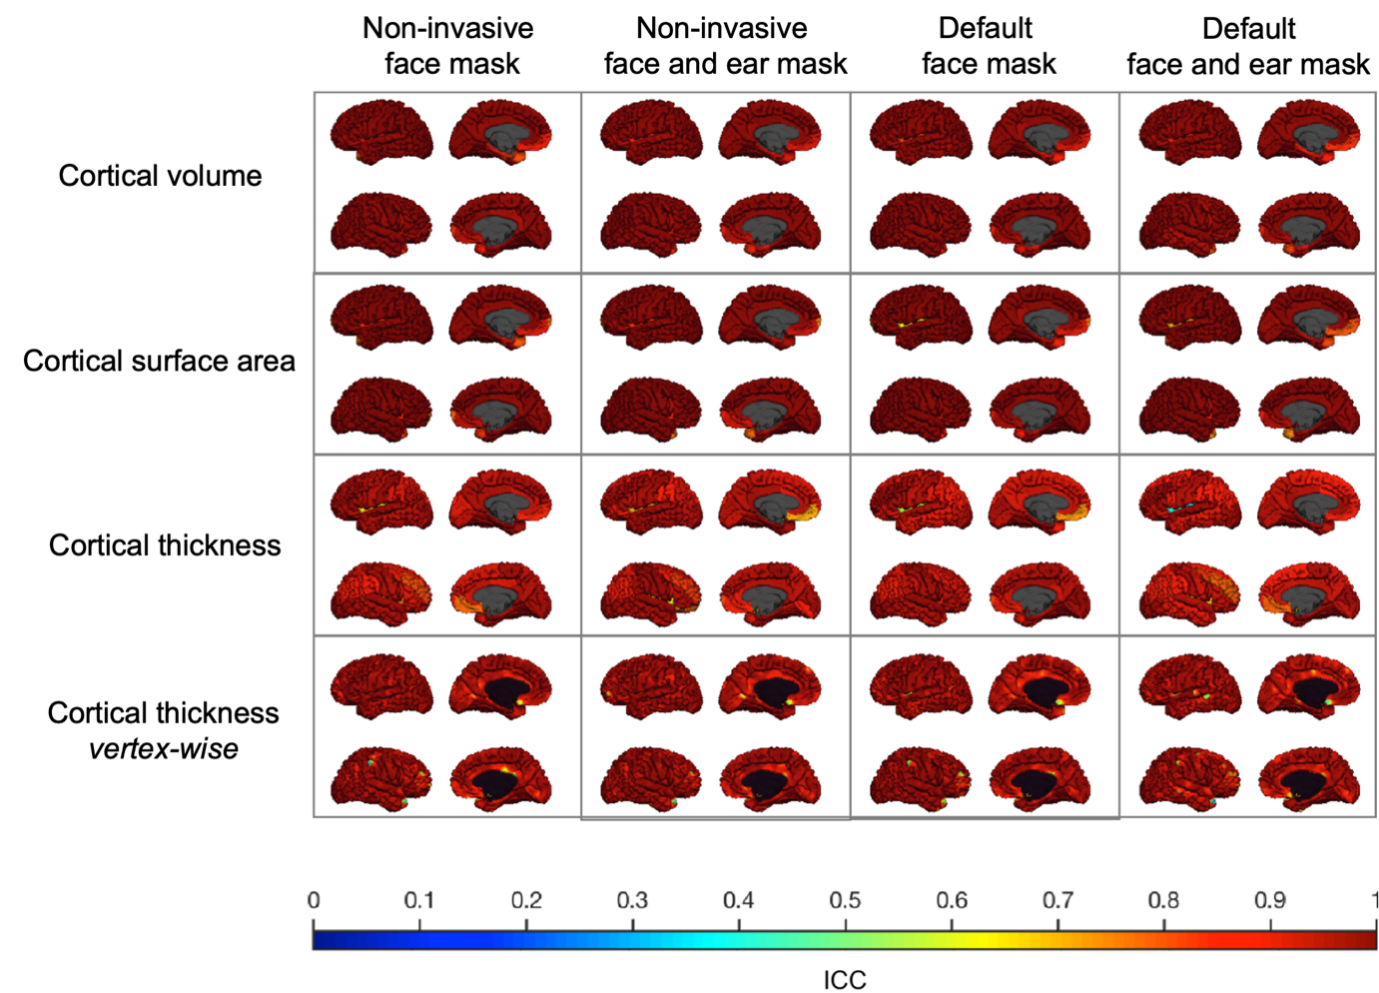

**Figure S3. De-identification properties and invasiveness of masks with varying coarseness.**

Invasiveness is defined as percentage of subjects where the mask overlapped cortical gray matter on multiple axial slices. To find the optimal mask settings we altered the coarseness of the masks by varying the grid step value (x-axis) and calculated the percentage of subjects where the face mask (grey) or ear mask (black) overlapped cortical gray matter (y-axis). Box A shows the child data (N=25). The face renderings shown here are visualizations of the average child created from the 25 children in this study. Box B shows the young adult data (N=16). The face renderings shown here are visualizations of the average young adult created from the 16 young adults in this study. The render of the non-invasive mask that did not overlap in any individual is indicated with blue and the mask with default coarseness with orange. In the purple square the unmasked brain is shown for comparison.

**Figure S4. ICC between brain measures in children derived from original scans versus scans subjected to different mask settings.**  
 The ICC for each brain measure is plotted on the average child scan. Each column shows a different masking setting. Within each square, the left hemisphere (top) and the right hemisphere (bottom) are shown from an outer and medial view.

**Figure S5. ICC between brain measures in adults derived from original scans versus scans subjected to different mask settings.**  
 The ICC for each brain measure is plotted on the average adult scan. Each column shows a different masking setting. Within each square, the left hemisphere (top) and the right hemisphere (bottom) are shown from an outer and medial view.

**Table S6. Effects of de-identification on test-retest reliability in young adults: Means, coefficients of variation and t-tests**
