

Figure S1

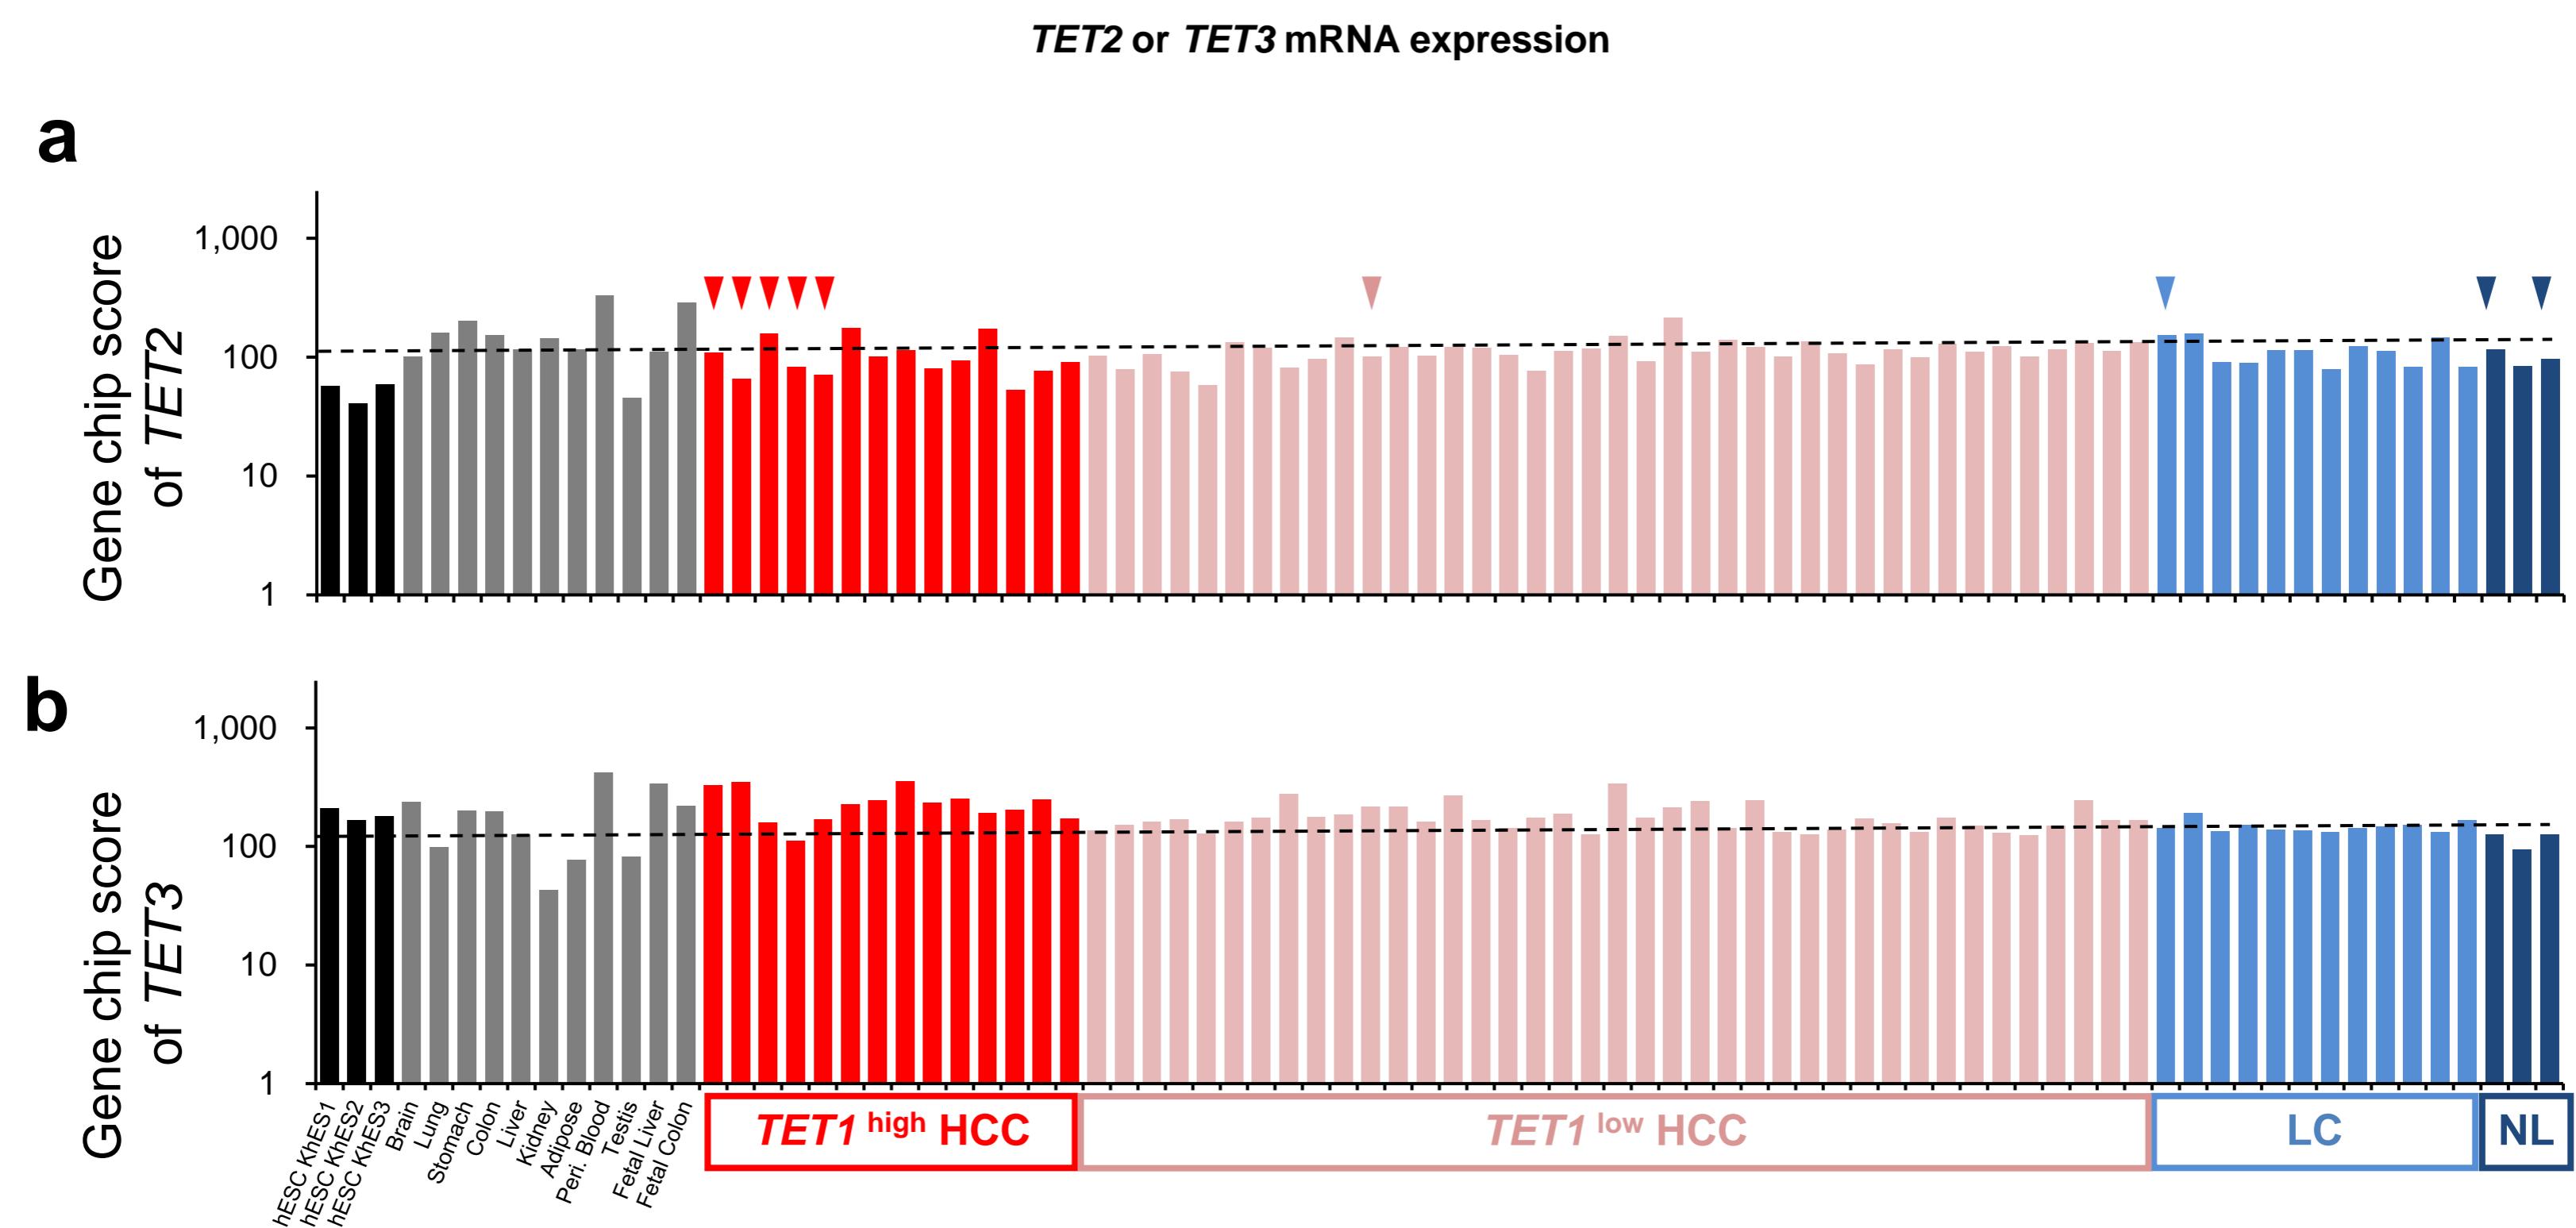

Figure S1 | mRNA expression level of TET2 and TET3.

TET2 (a) and TET3 (b) expression level among hESCs, somatic tissues and HCCs in expression microarray (U133 plus 2.0, Affymetrix). TET2, Gene Name- KIAA1546, Probe Name: 227624at. Lower: TET3, Gene Name: hCG_40378, Probe Name: 235542at. hESC, human embryonic stem cell ; HCC, hepatocellular carcinoma; LC, liver cirrhosis (corresponding non-cancerous liver); NL, normal liver.

Figure S2

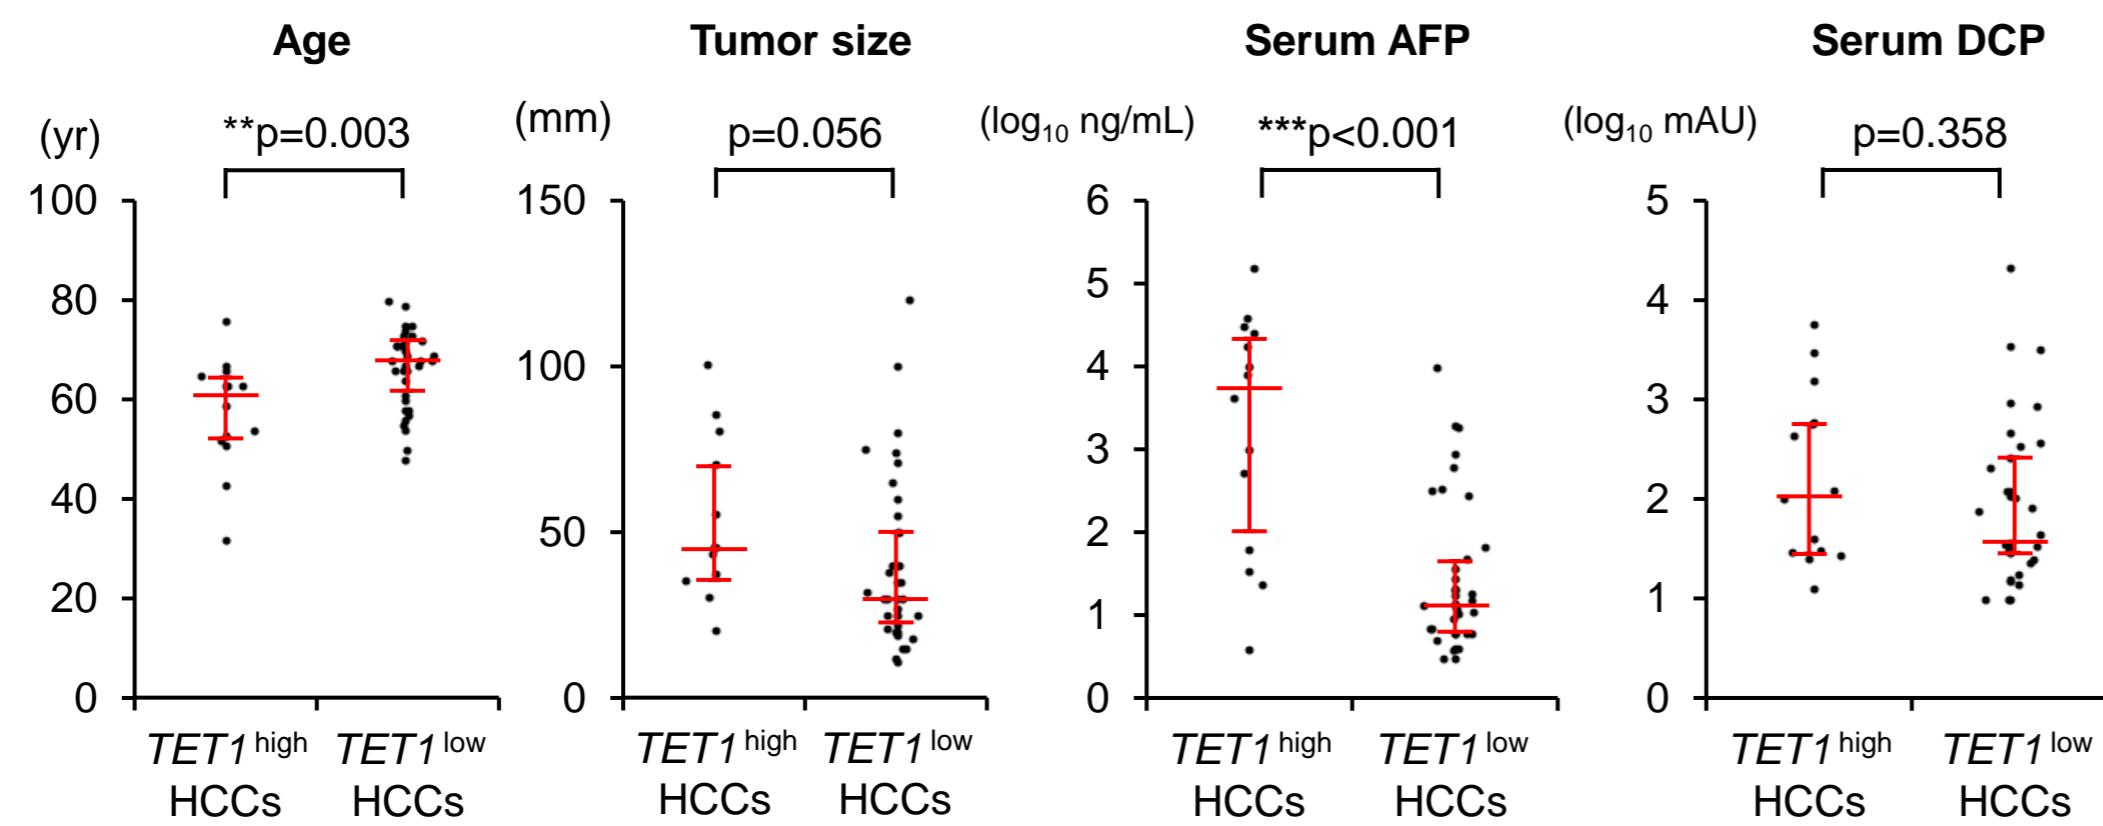

Figure S2 | Clinicopathological characteristics of HCC patients associated with *TET1* expression.

Clinical characteristics of HCCs. AFP, α -fetoprotein; DCP, des-gamma-carboxy prothrombin; Data are shown as median \pm quartile. p values are measured by Mann–Whitney U test. **p < 0.01; ***p <0.001.

Figure S3

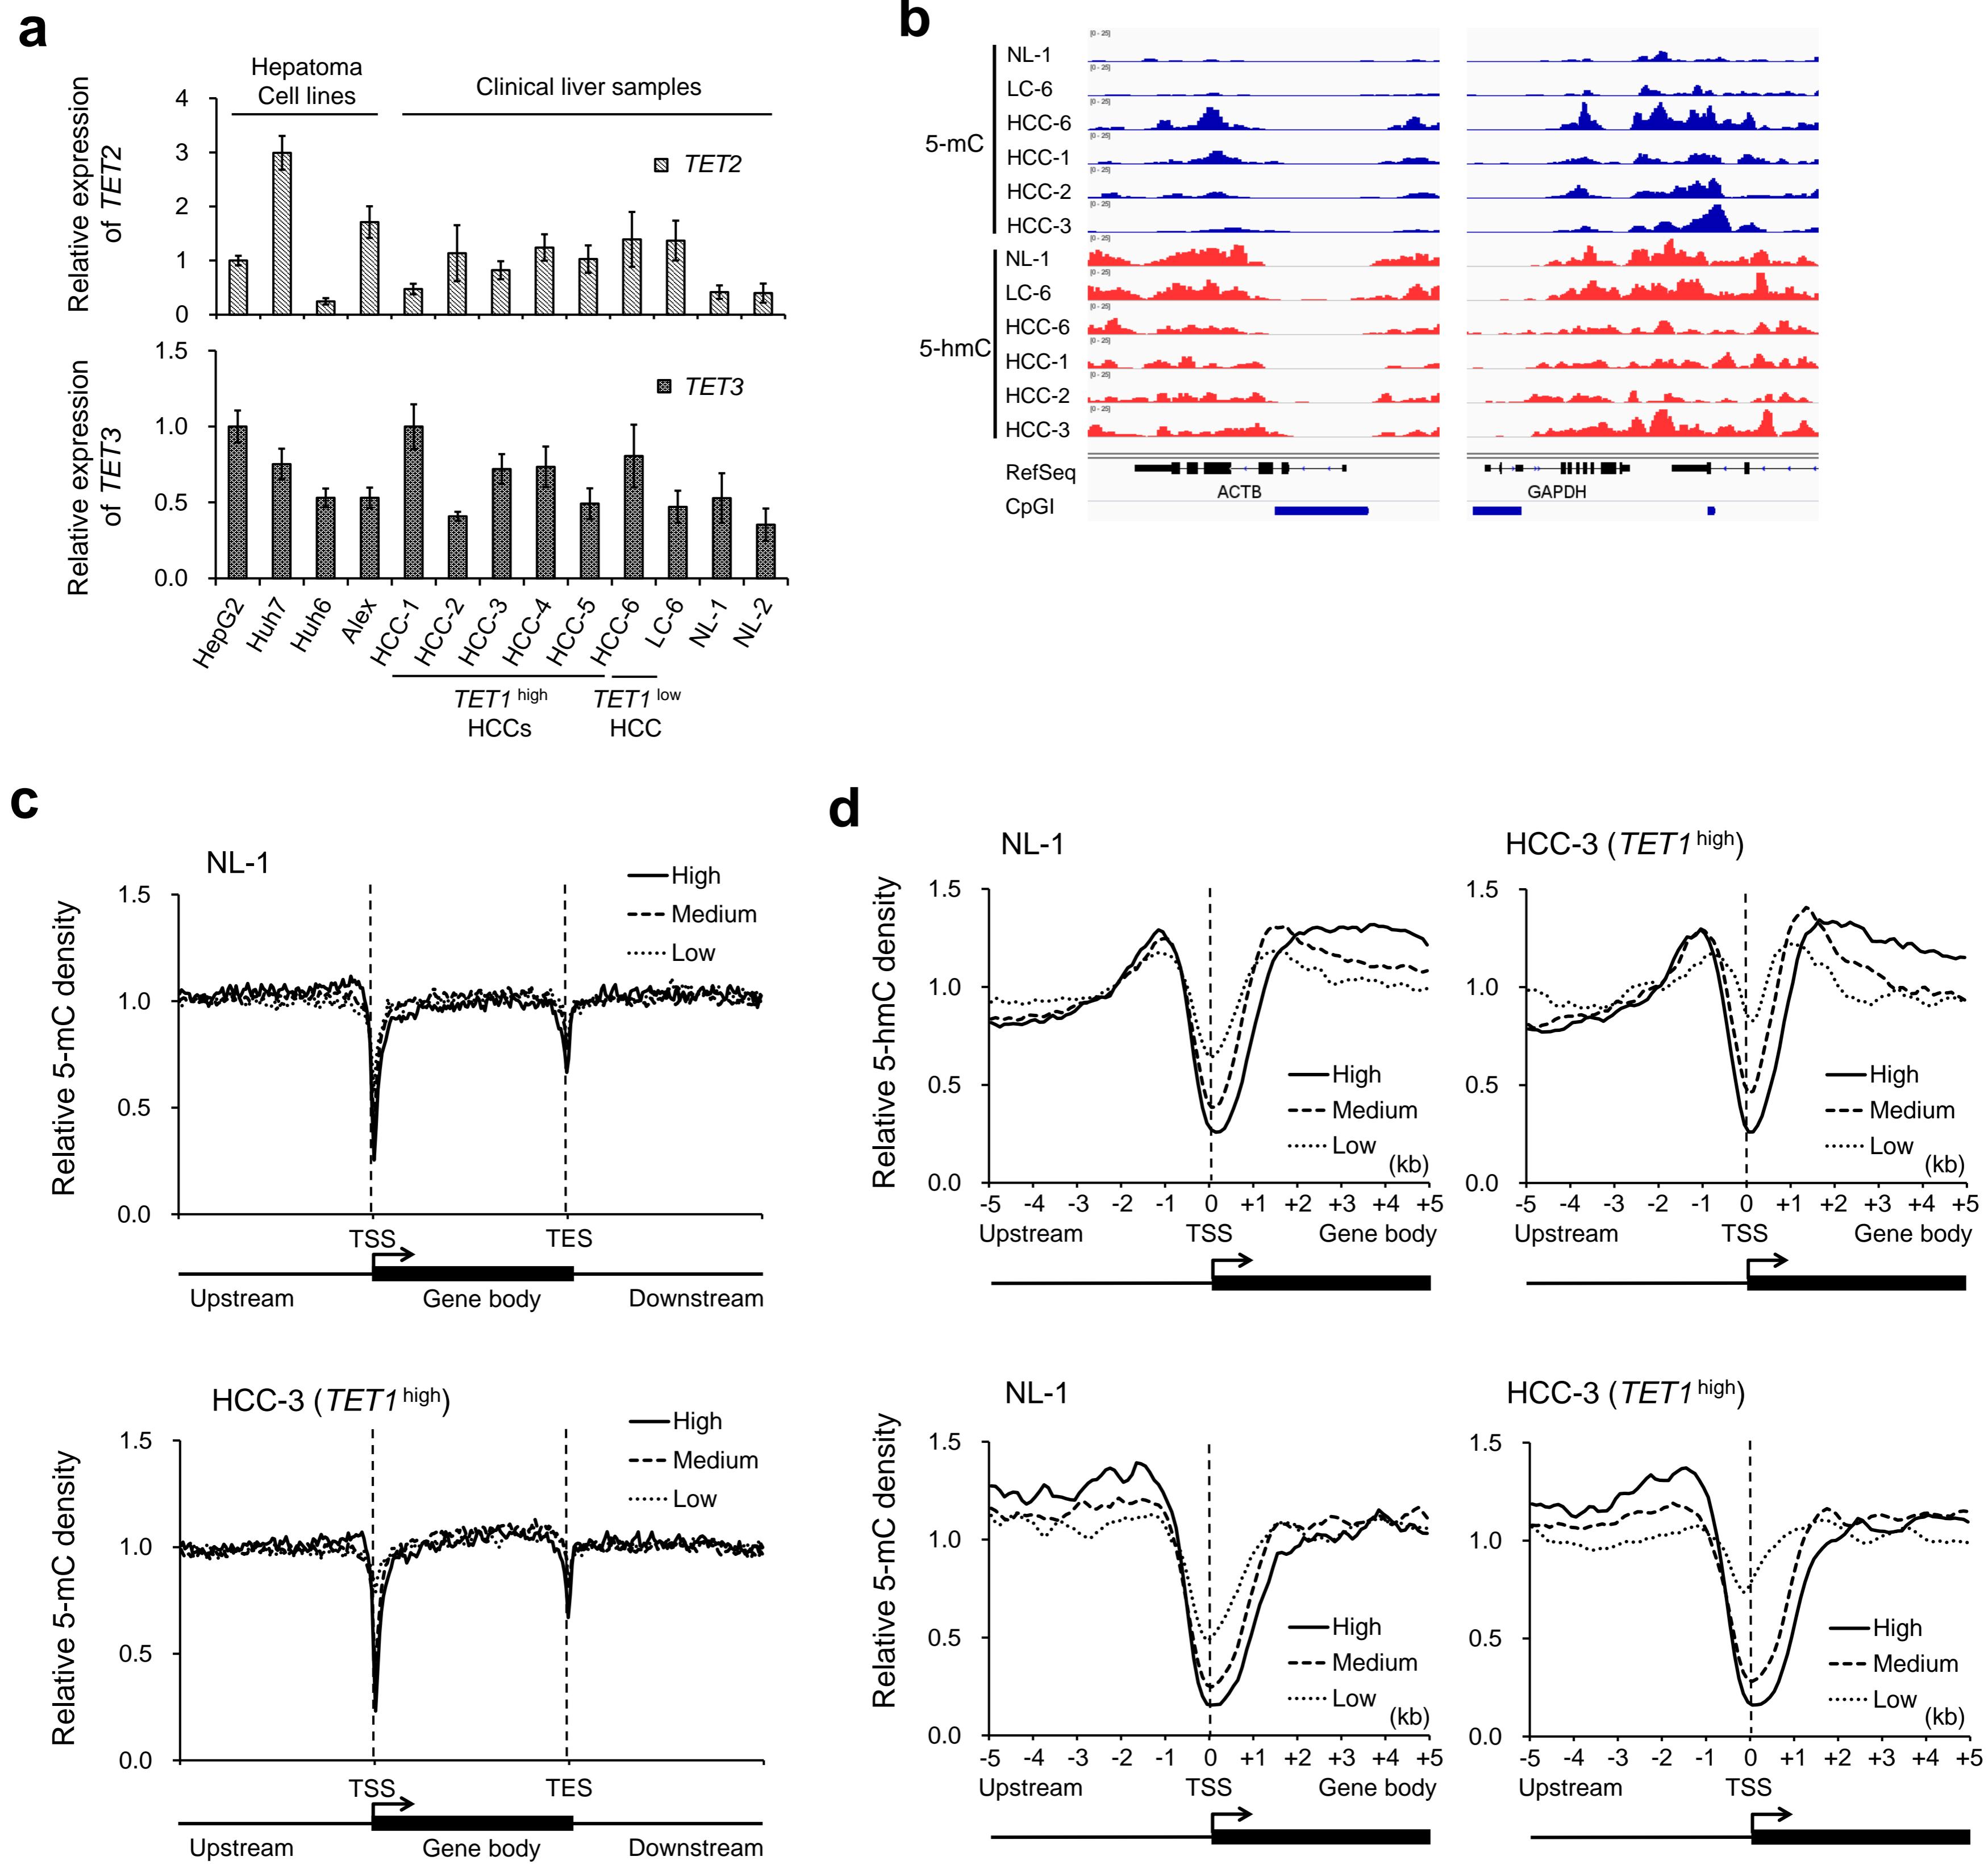

Figure S3 | 5mC and 5hmC profiles of clinical liver tissues.

(a) Relative TET2 (upper) and TET3 (lower) mRNA expression of hepatoma cells and clinical liver samples by RT-qPCR. *TET1* ^{high} HCCs, HCCs of high level TET1 (GeneChip score > 50); *TET1* ^{low} HCC, HCC of low level TET1 (GeneChip score < 50). Data are shown as mean \pm SD from triplicate experiments. (b) Genome-wide profiling of 5mC (upper) and 5hmC (lower) for clinical liver tissues in ACTB and GAPDH locus. (c) 5mC distributions relative to human RefSeq gene position by MeDIP-seq at different expression levels in clinical liver samples. (d) 5hmC and 5mC distributions relative to each gene position around TSS (\pm 5kb) by hmeDIP-seq (upper) and MeDIP-seq (lower) for clinical liver samples according to their gene expression levels. Expression level, High; GeneChip score > 250, Low; GeneChip score < 25, Medium; GeneChip score 25-250

Figure S4

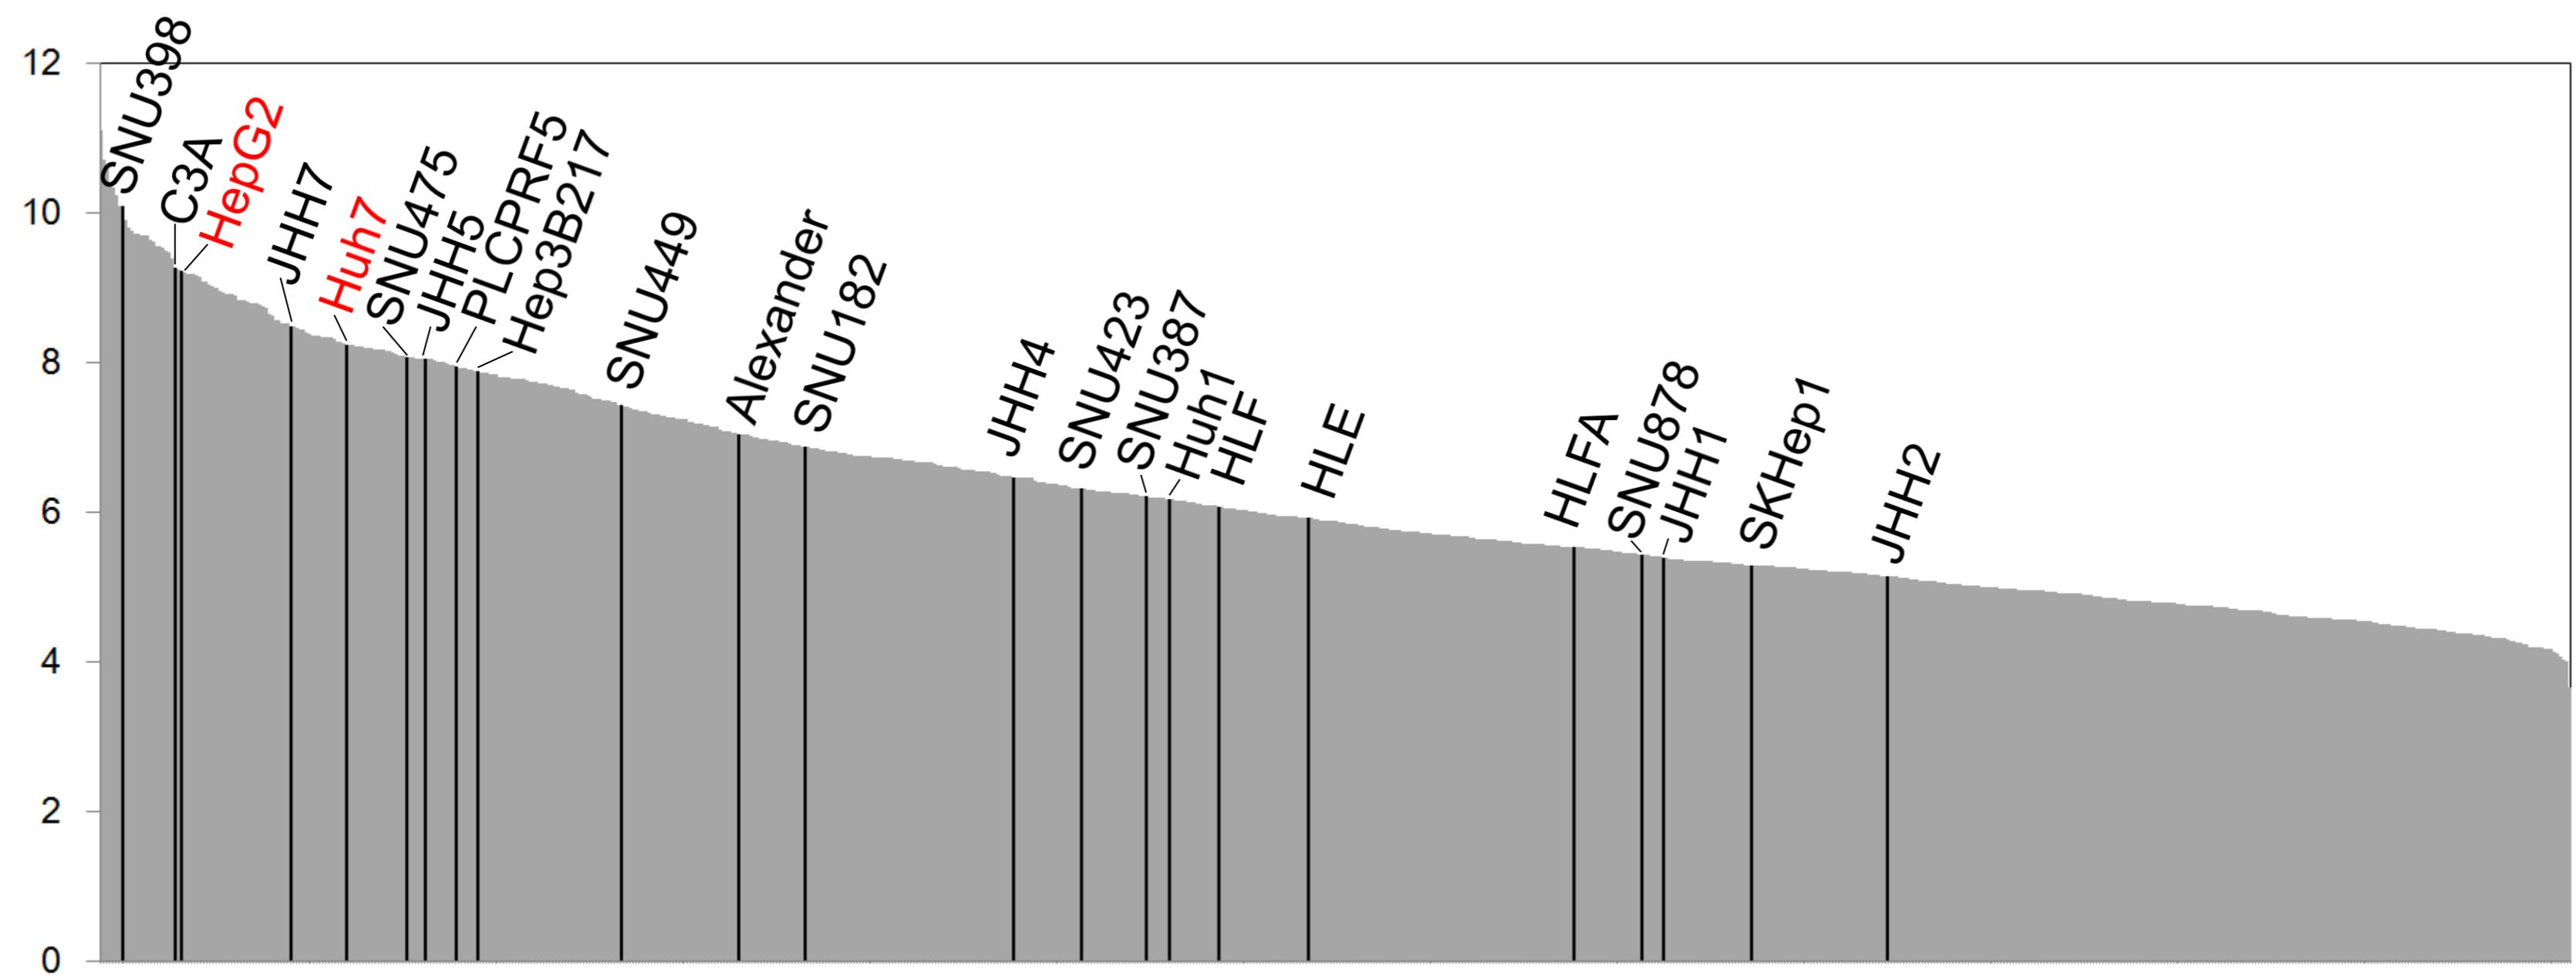

Figure S4 | Expression level of *TET1* in 807 CCLE cancer cell lines.

The 807 CCLE cancer cell lines are arranged in order of *TET1* expression level and shown in a gray bar graph. The 23 liver cancer cell lines are shown in black, and their names are appended above.
CCLE: Broad Institute Cancer Cell Line Encyclopedia, <https://portals.broadinstitute.org/ccle>

Figure S5

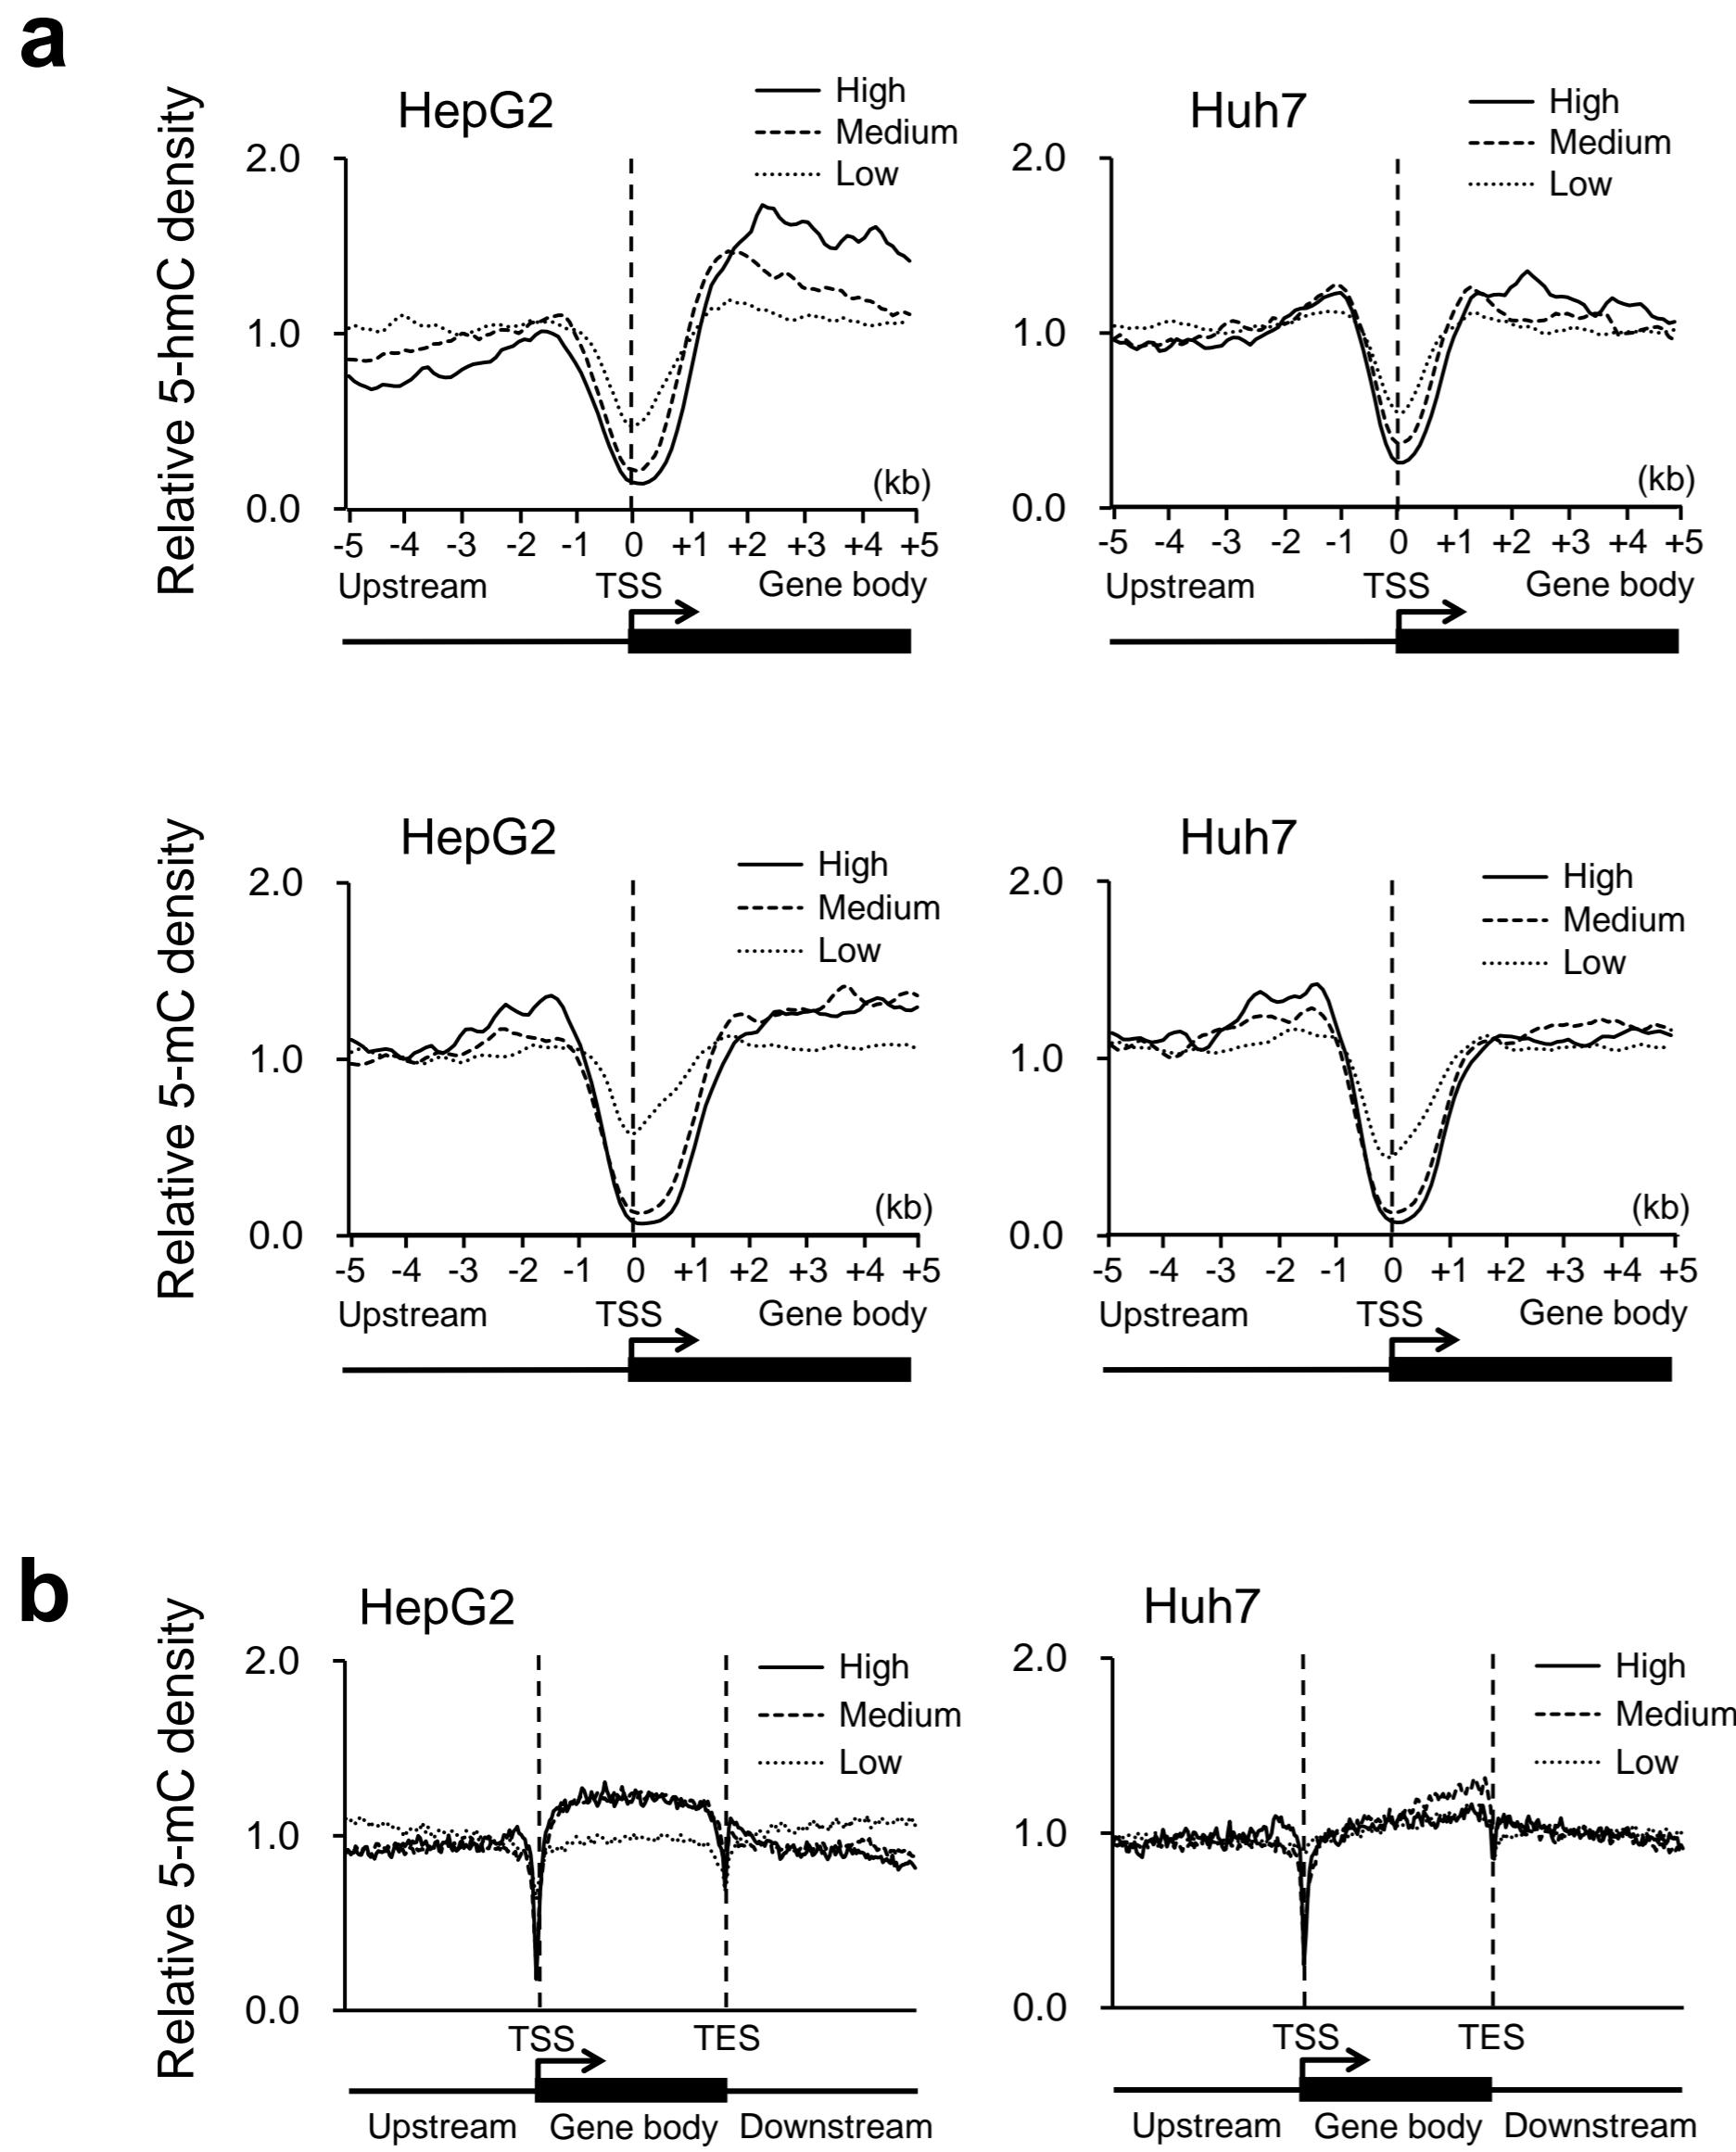

Figure S5 | 5hmC and 5mC distributions of liver cancer cell lines.

(a) 5hmC and 5mC distributions relative to each gene position around TSS by hmeDIP- (upper) and MeDIP-seq (lower) with regard to the expression levels in HepG2 and Huh7 cells. (b) 5mC distributions relative to human RefSeq gene position by MeDIP-seq according to the expression levels in HepG2 and Huh7. Expression level, High; GeneChip score > 250, Low; GeneChip score < 25, Medium; GeneChip score 25-250

Figure S6

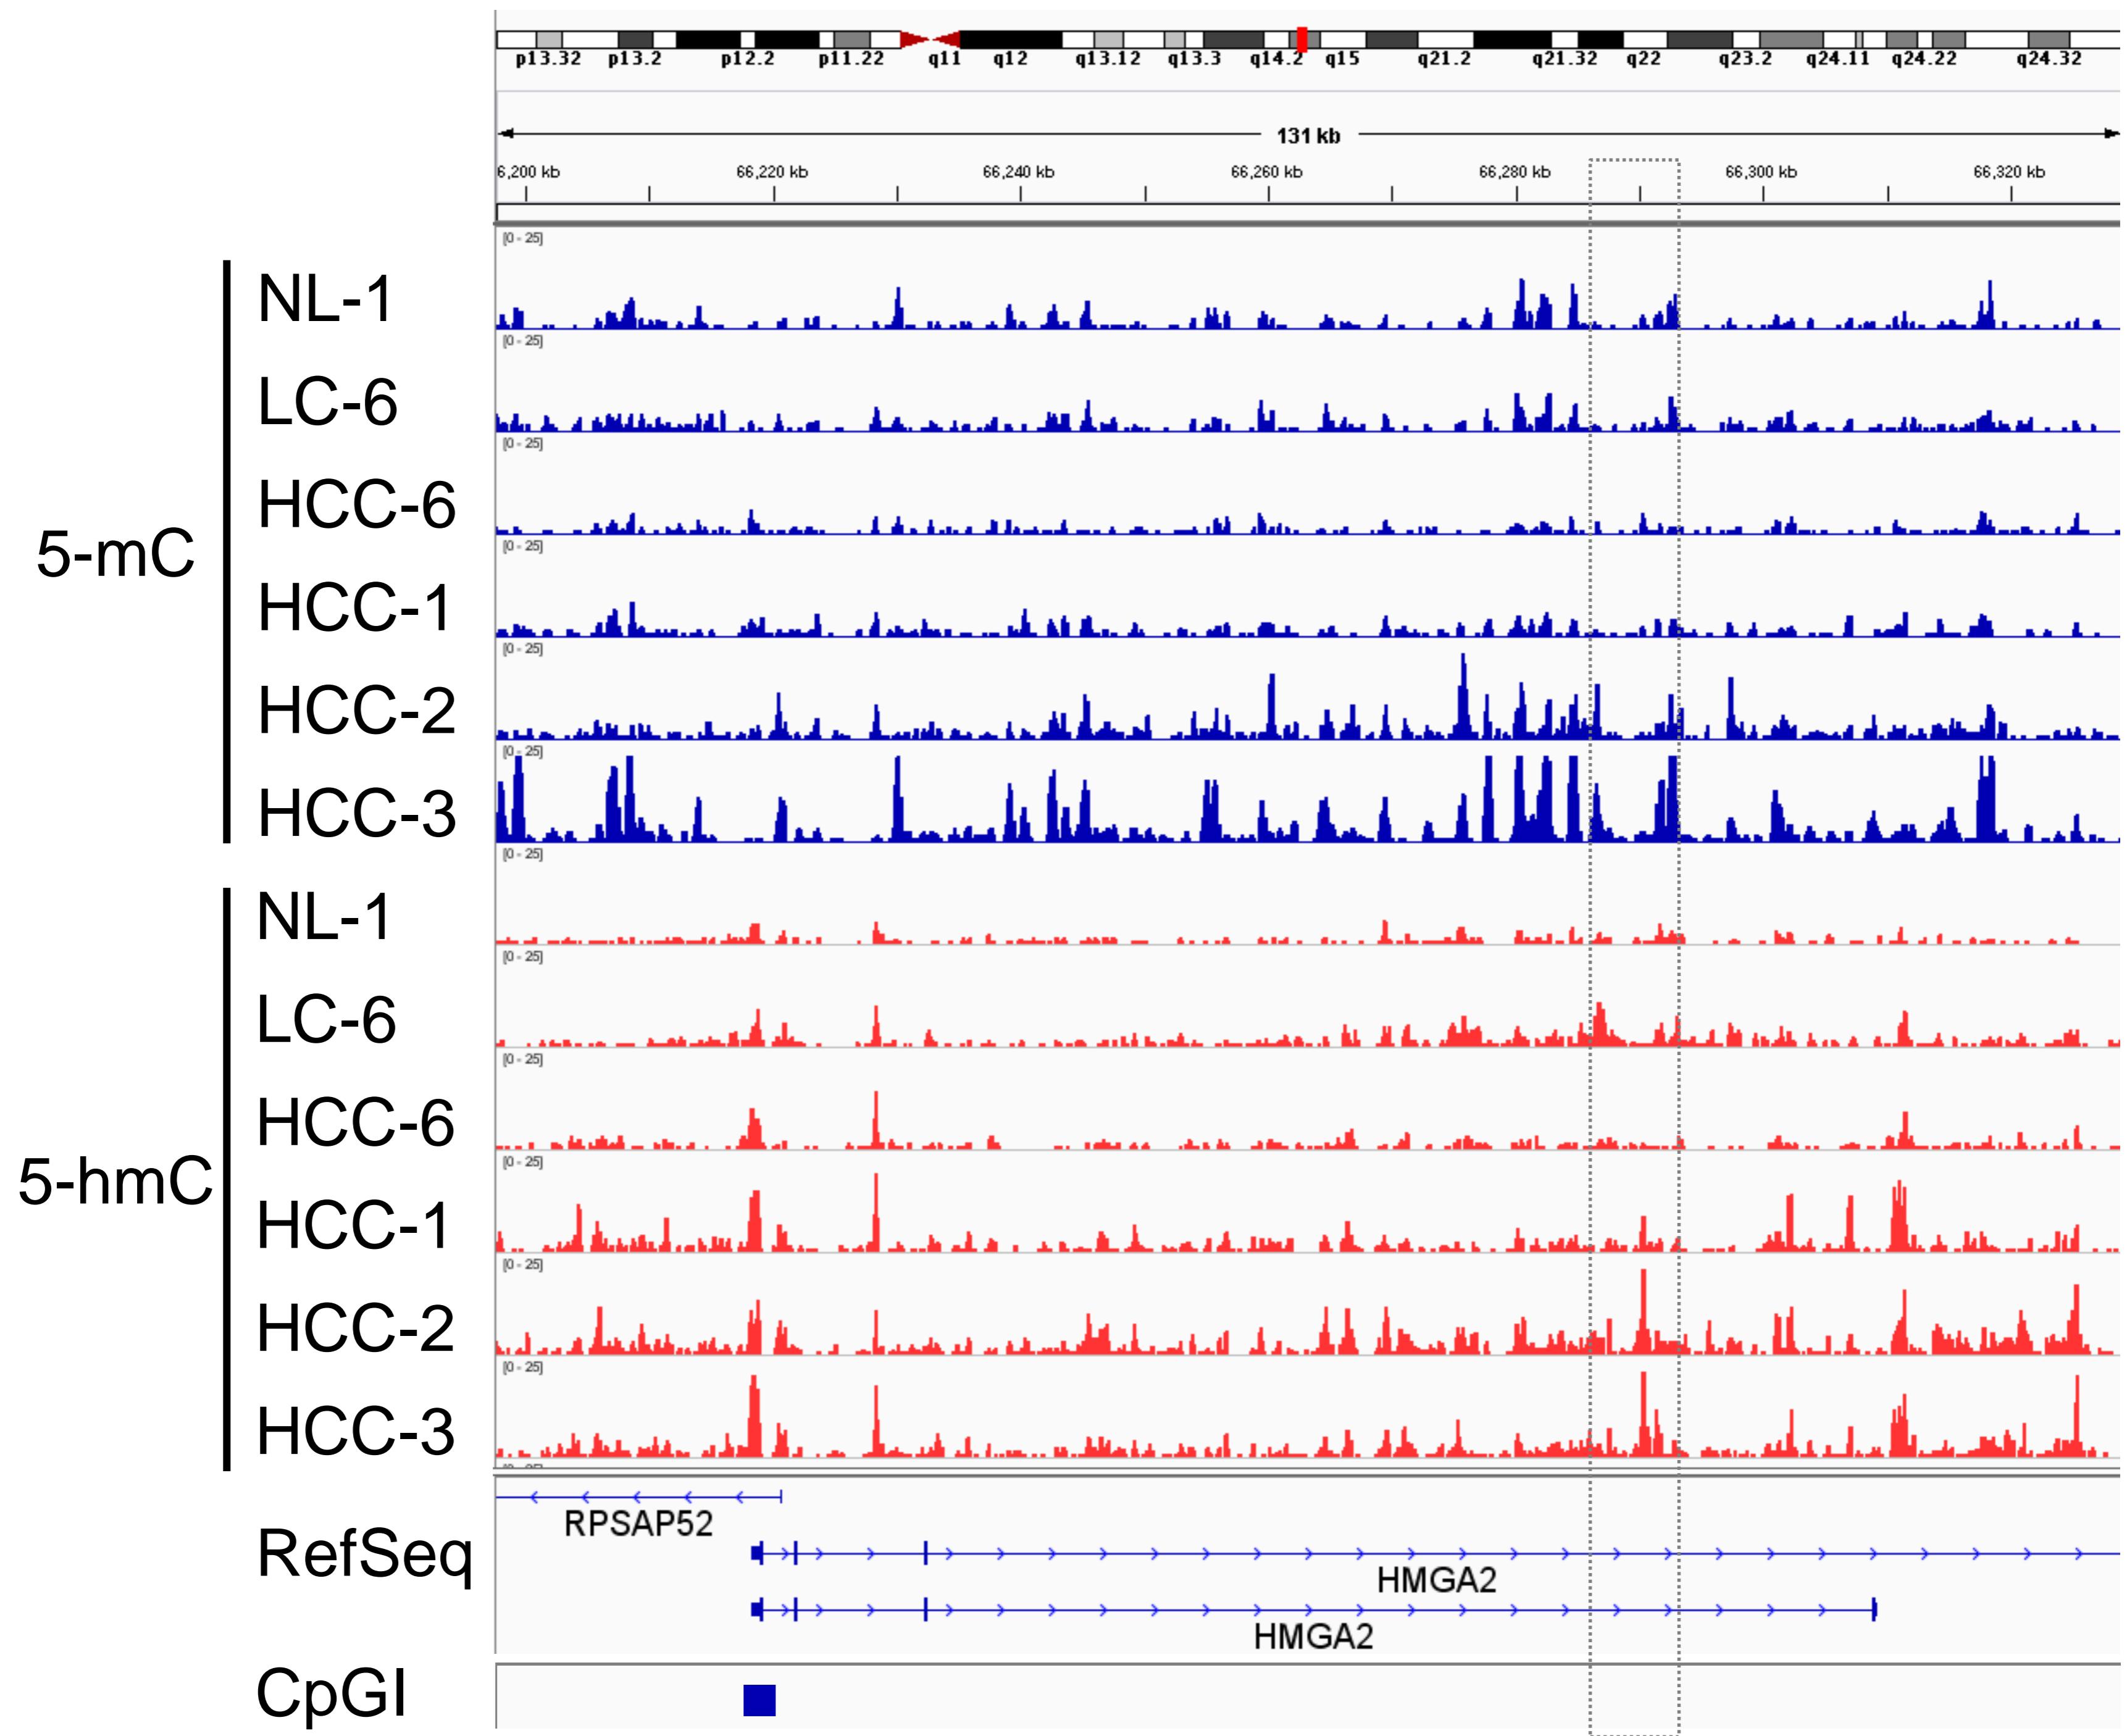

Figure S6 | 5mC and 5hmC mapping of HMGA2 locus for clinical liver tissues.

5mC- (blue) and 5hmC- (red) enriched regions of HMGA2 locus are demonstrated using Integrative Genomics Viewer (IGV). The box with dotted lines indicates intragenic enhancer regions identified by ChIP-sequencing analysis of liver cancer cells

Figure S7

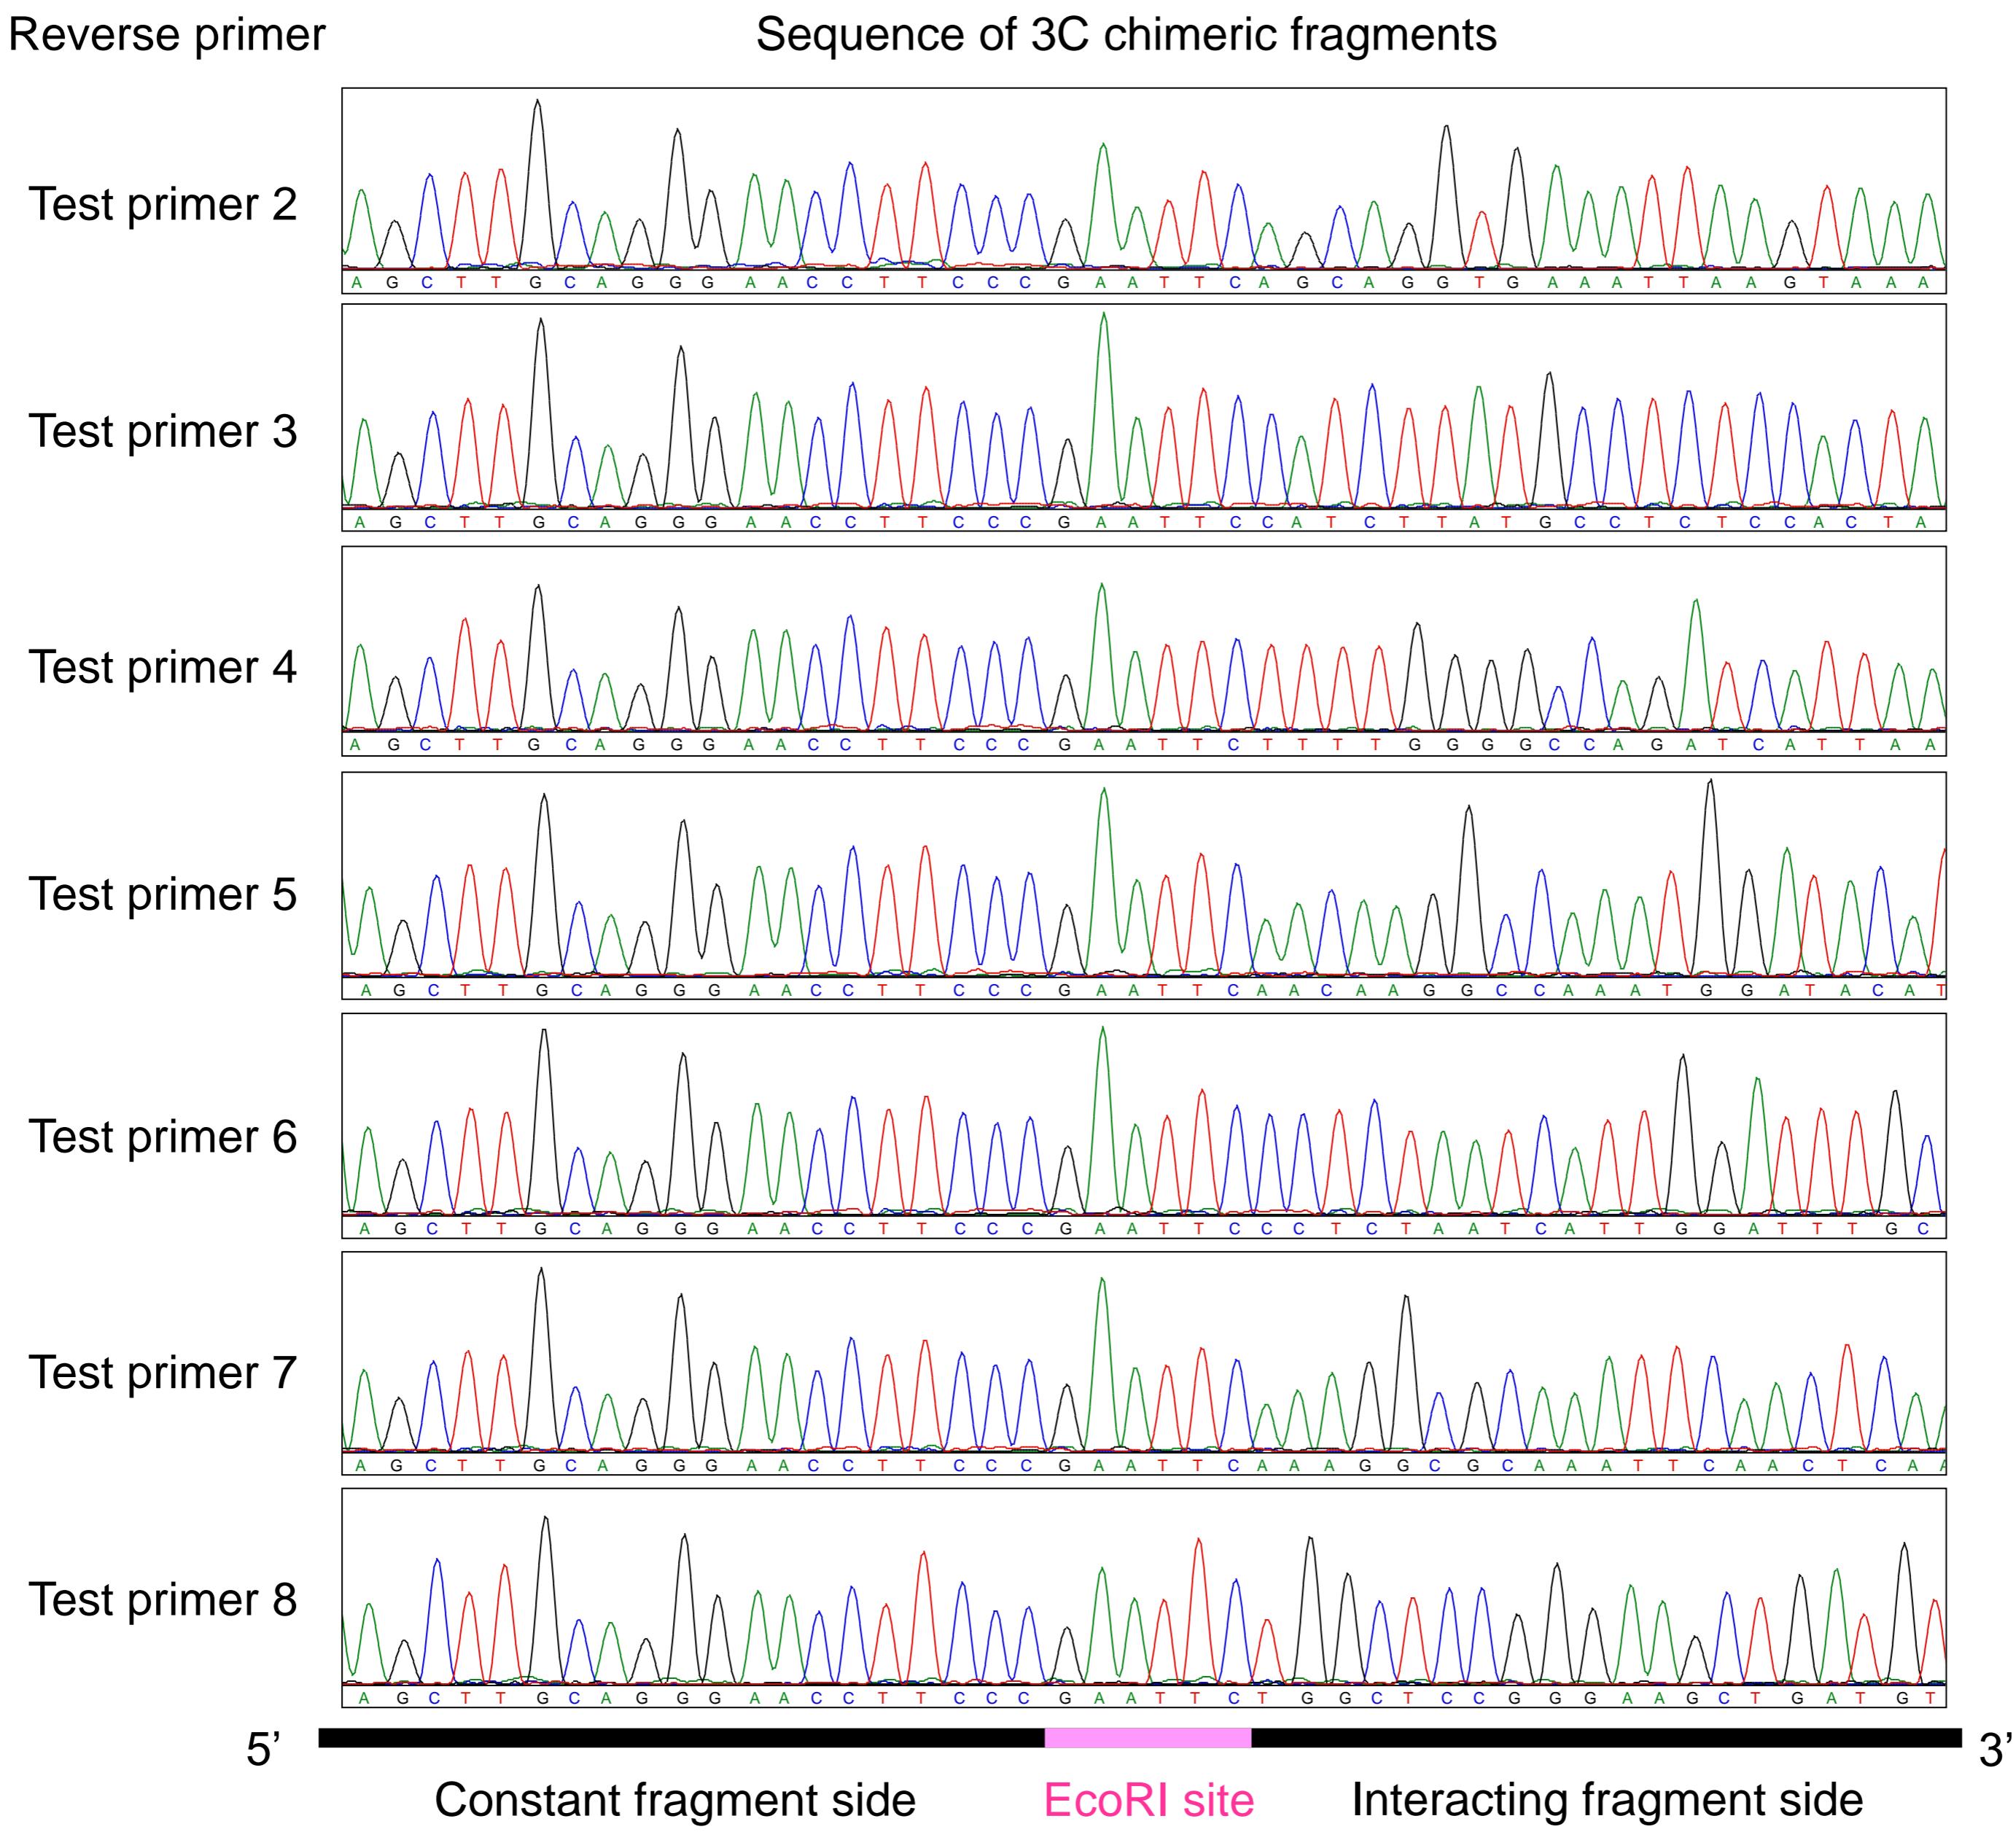

Figure S7 | Sanger Sequence of 3C chimeric fragments.

The PCR product is cloned and sequenced with primers that anneal to the vector backbone.

Figure S8

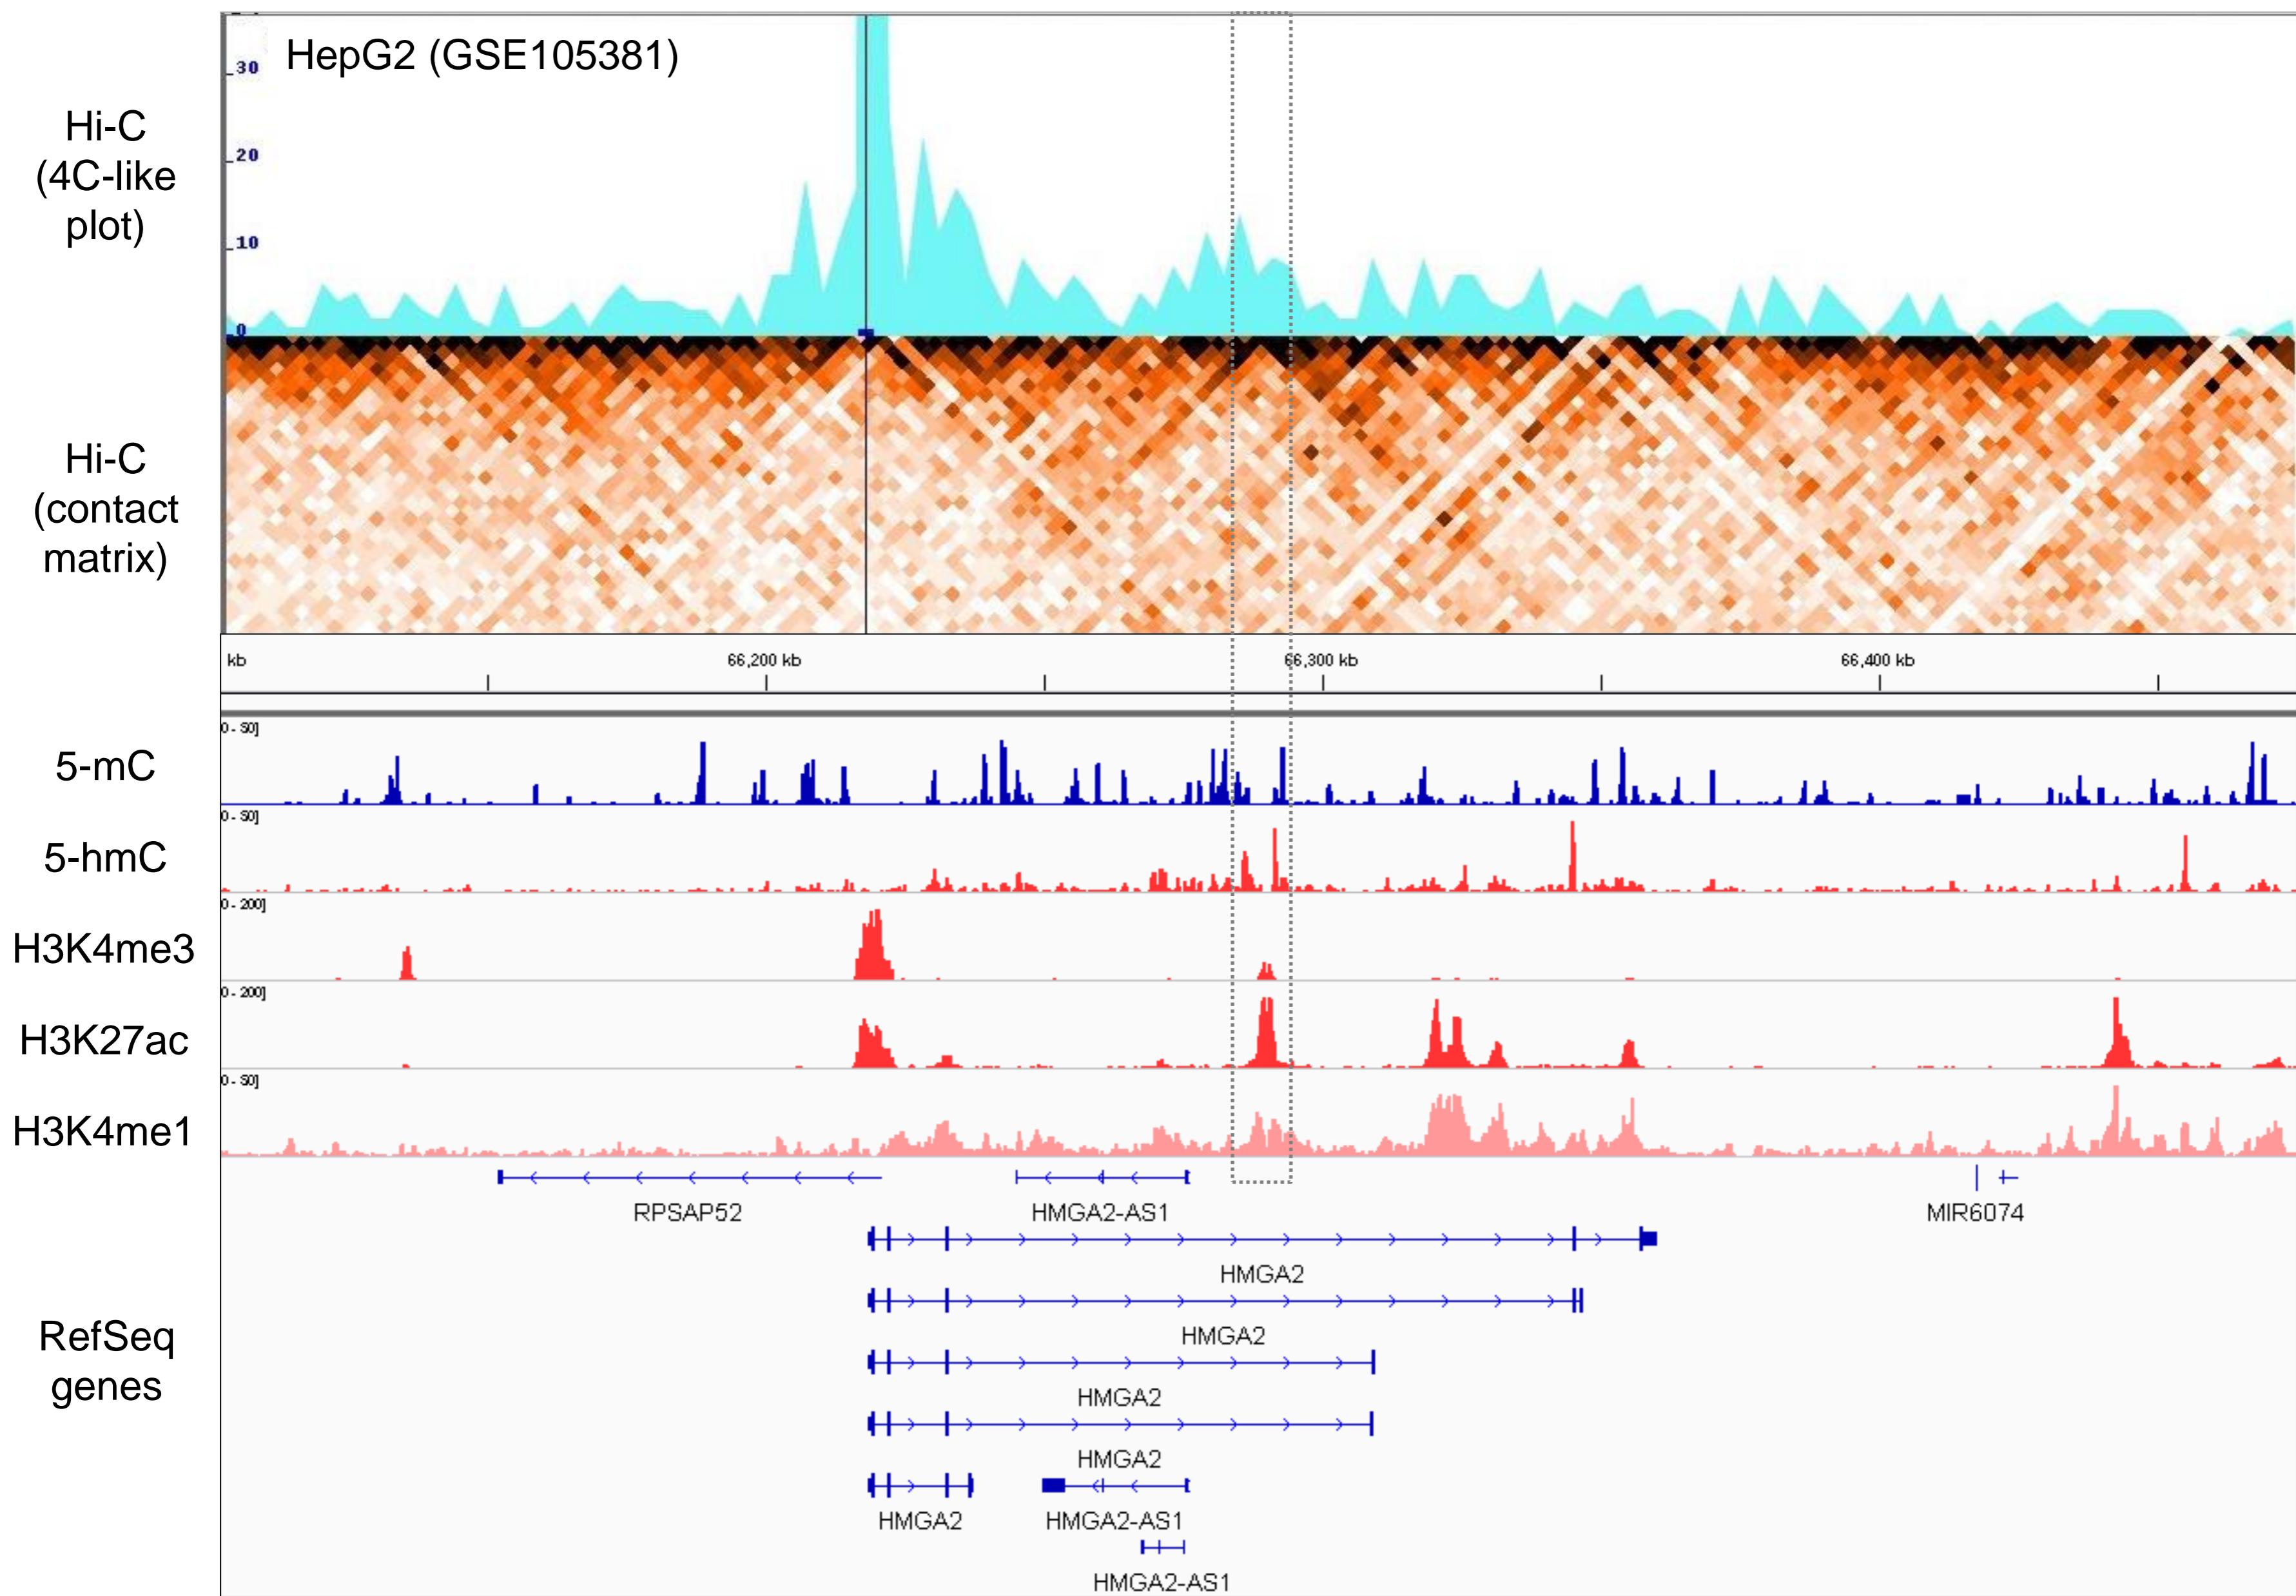

Figure S8 | 5mC and 5hmC mapping of HMGA2 locus for clinical liver tissues.

5mC- (blue) and 5hmC- (red) enriched regions of HMGA2 locus are demonstrated using Integrative Genomics Viewer (IGV). The box with dotted lines indicates intragenic enhancer regions identified by ChIP-sequencing analysis of liver cancer cells

Figure S9

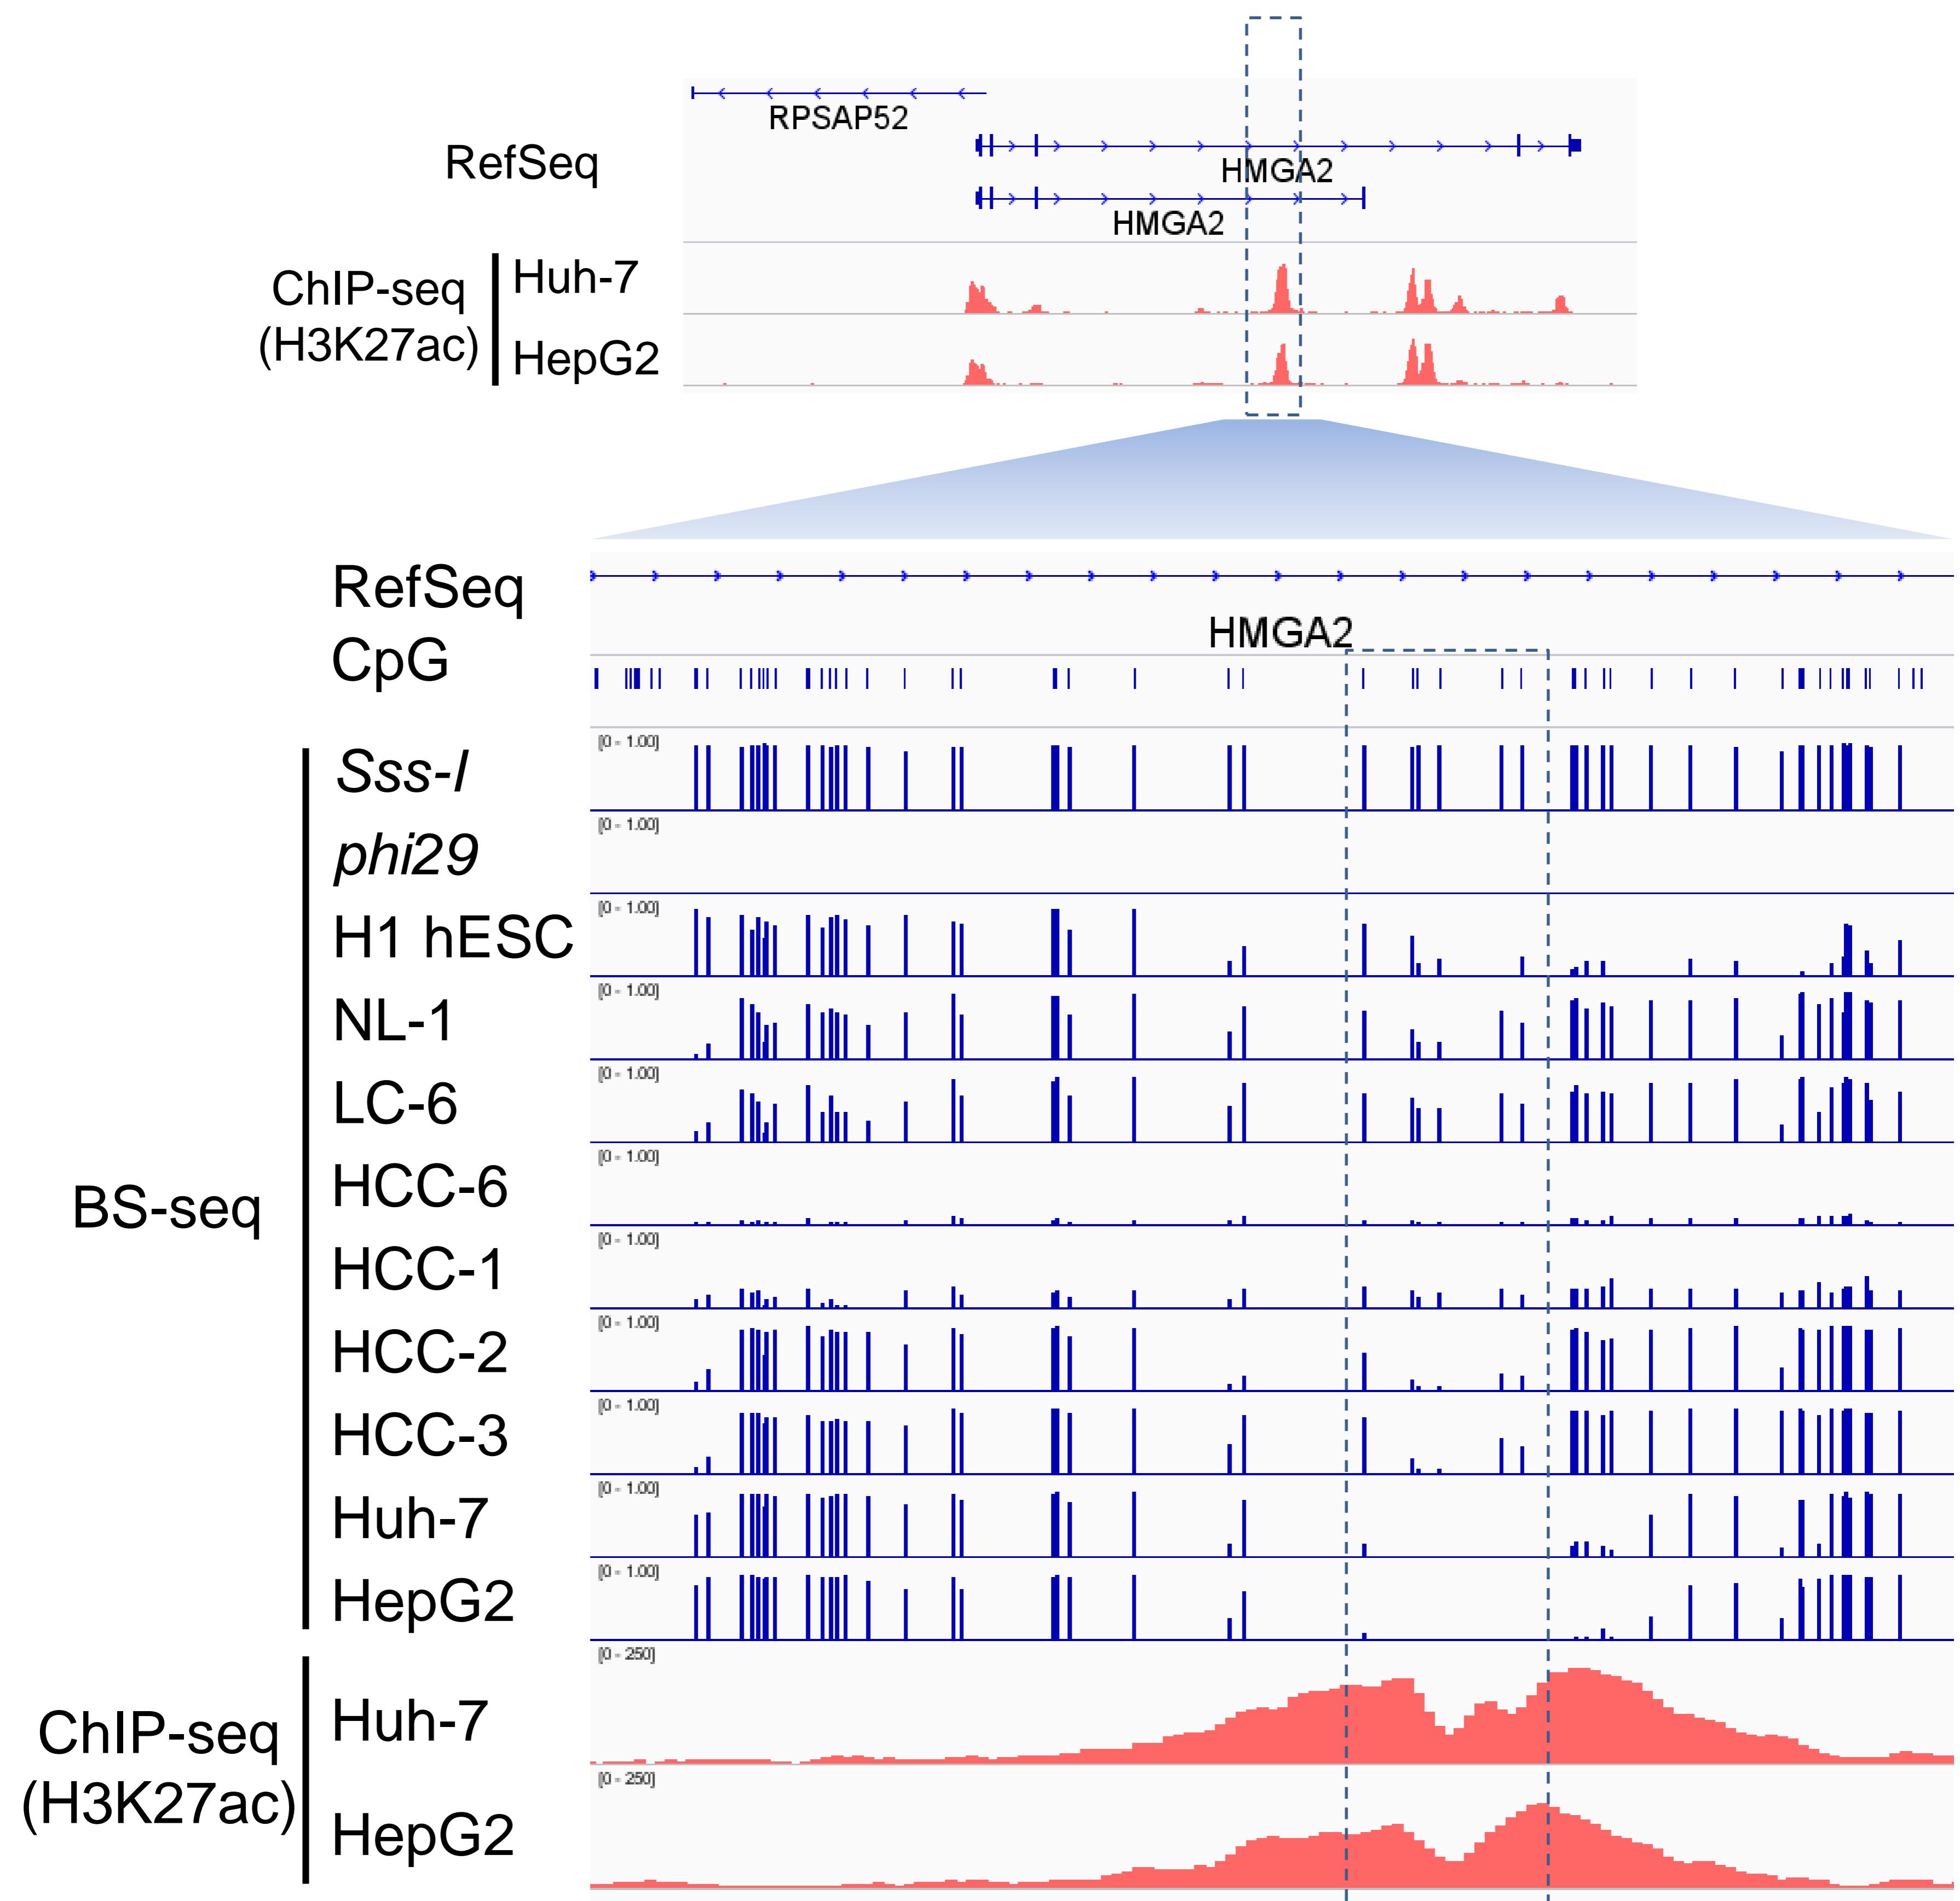

Figure S9 | 5mC and 5hmC mapping of HMGA2 locus for clinical liver tissues.

5mC- (blue) and 5hmC- (red) enriched regions of HMGA2 locus are demonstrated using Integrative Genomics Viewer (IGV). The box with dotted lines indicates intragenic enhancer regions identified by ChIP-sequencing analysis of liver cancer cells

Figure S10

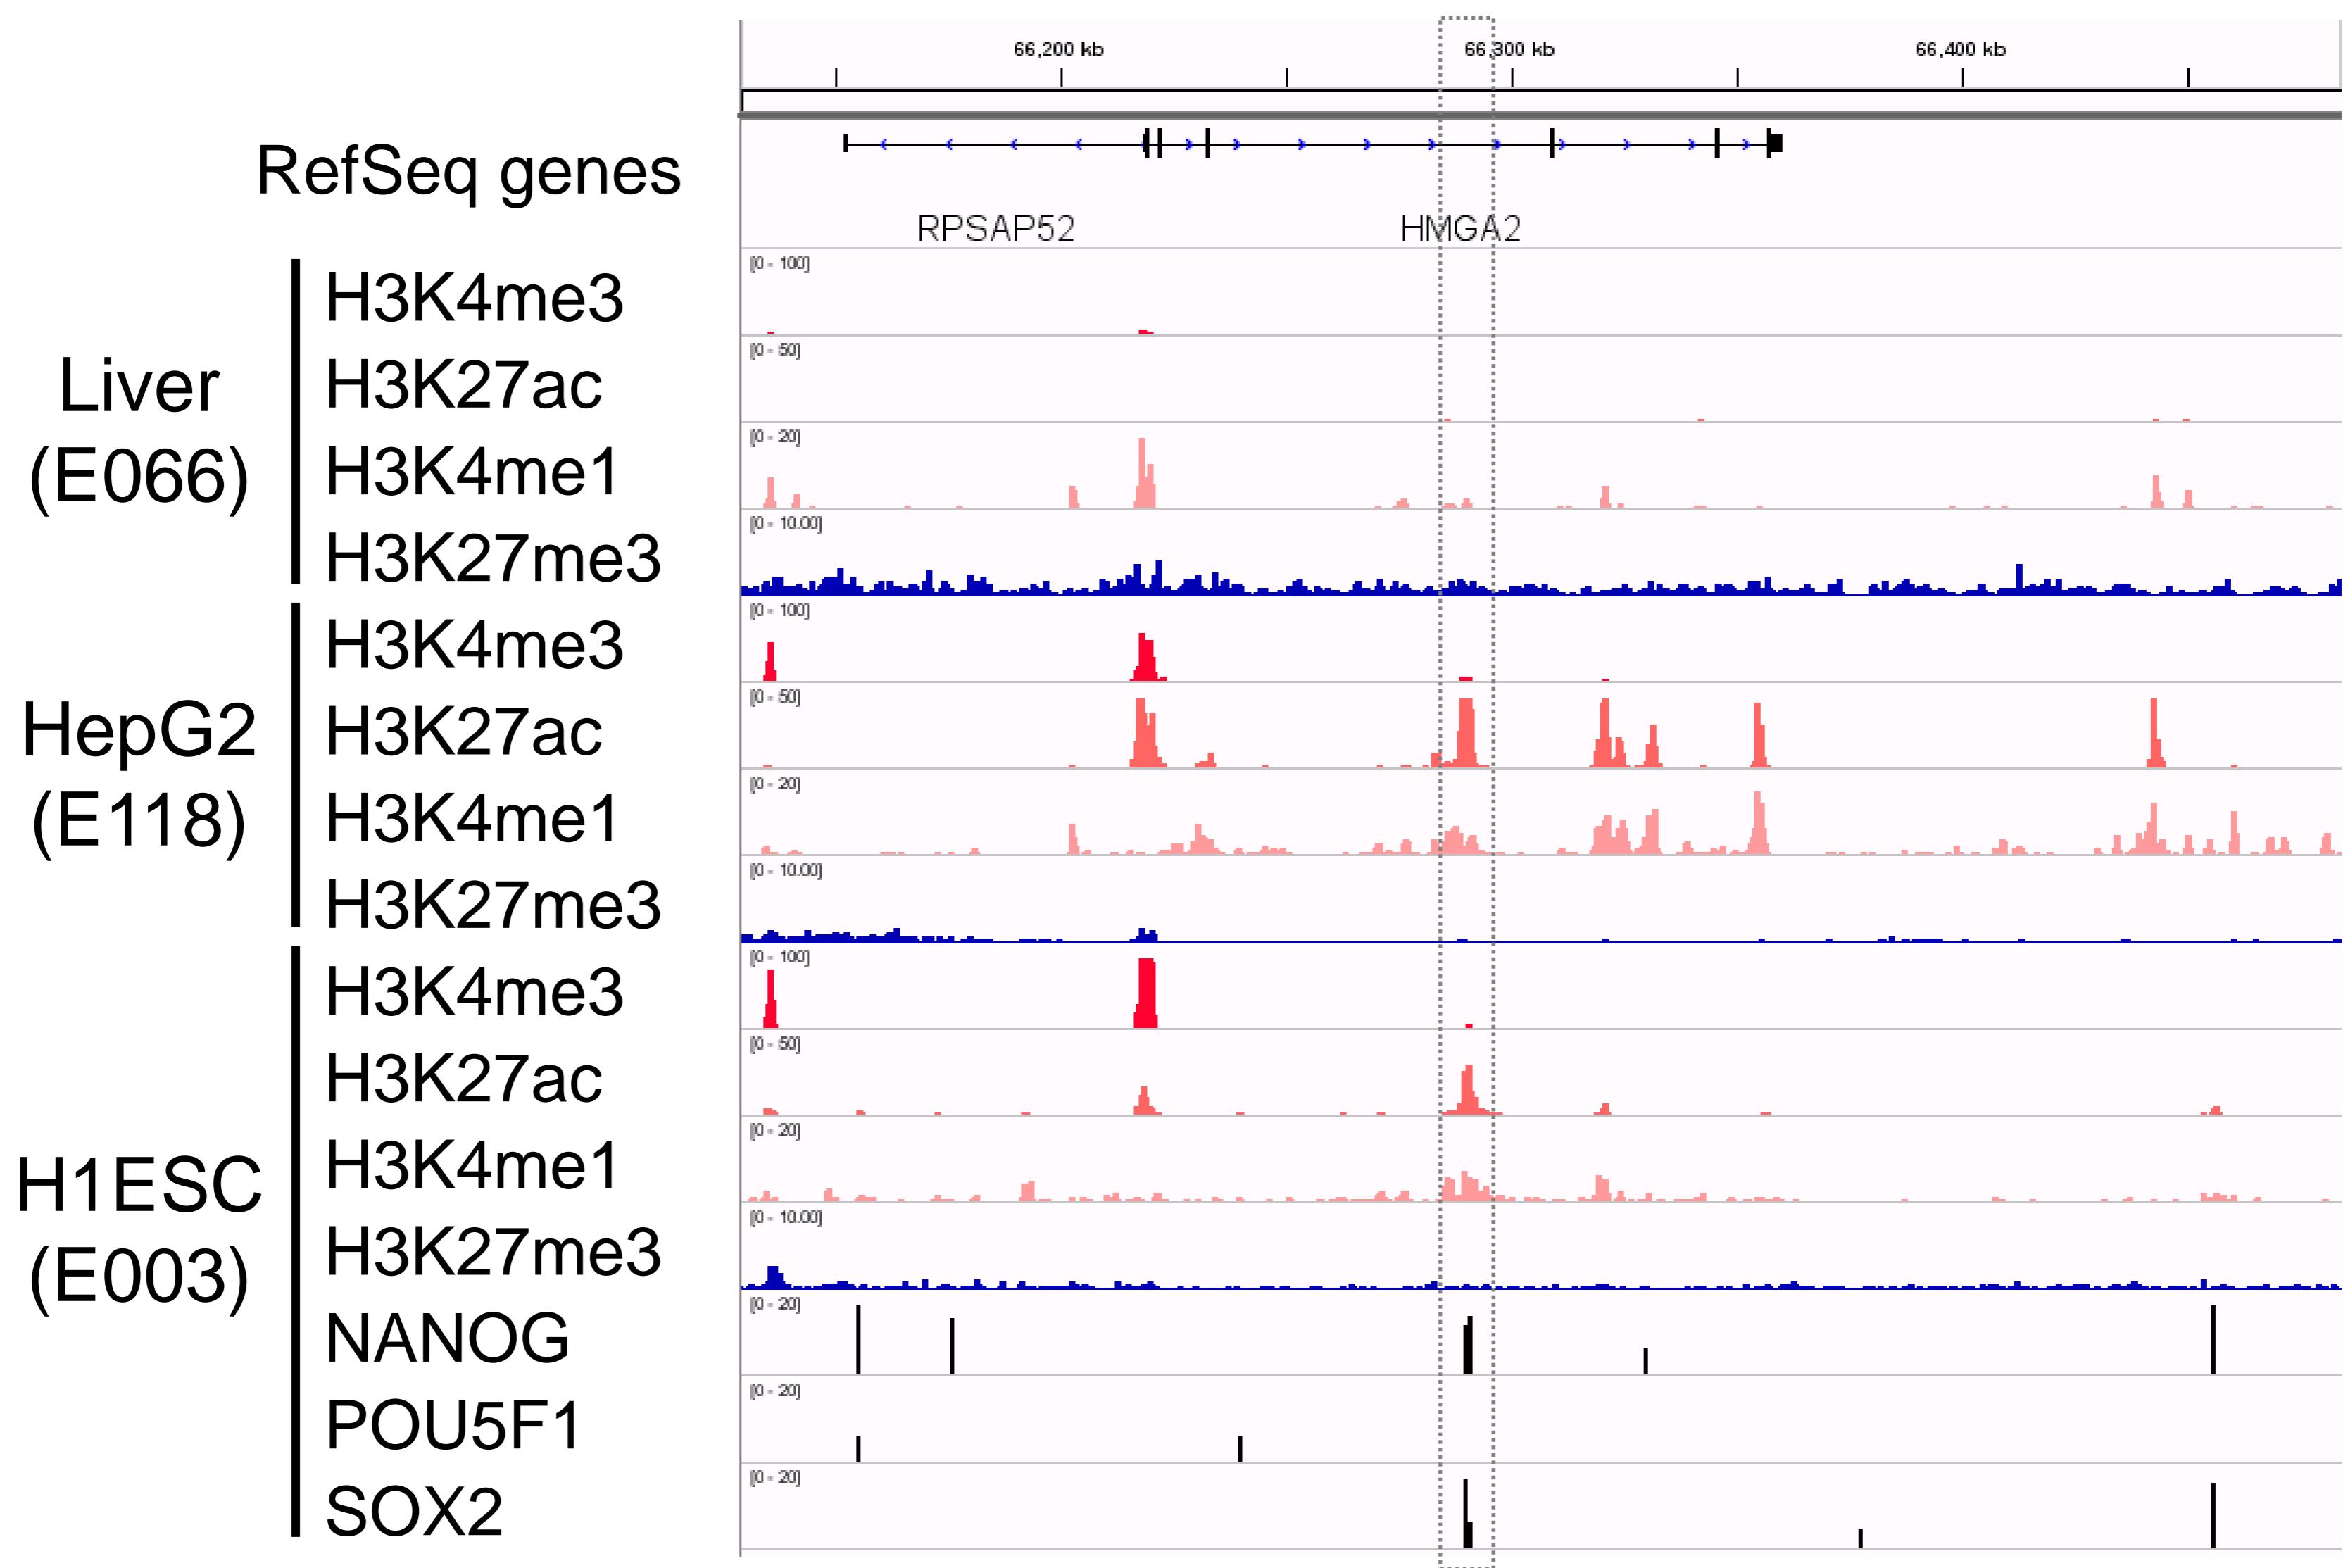

Figure S10 | Histone modification status5mC and 5hmC mapping of HMGA2 locus for clinical liver tissues.
5mC- (blue) and 5hmC- (red) enriched regions of HMGA2 locus are demonstrated using Integrative Genomics Viewer (IGV). The box with dotted lines indicates intragenic enhancer regions identified by ChIP-sequencing analysis of liver cancer cells
