Figures S1

Figure S1. Histograms of all sarcomere length measures made per stroke participant (A) and each participant who hadn't undergone a stroke (B). The non-paretic and dominant arms are shown in blue and the paretic and non-dominant arms are shown in orange. Participants 1-11 match up with participant 1-11 in Table 1. All y-axes have been scaled uniformly, based on the maximum count (70) that makes the data for the majority of participants most viewable. Insets are provided for the 2 participants (Stroke 2, Stroke 7) for which the amount of data exceeded these limits.
