Supplementary data (Ula V. Jurkunas et al.)

Supplementary Figure S1: LF SSEA4+ cell sphere formation assay. Spheres were labeled with BrdU 24 hours before fixation at days 2, 4, and 6 to detect dividing cells (10 x magnification).

Supplementary data (Ula V. Jurkunas et al.)

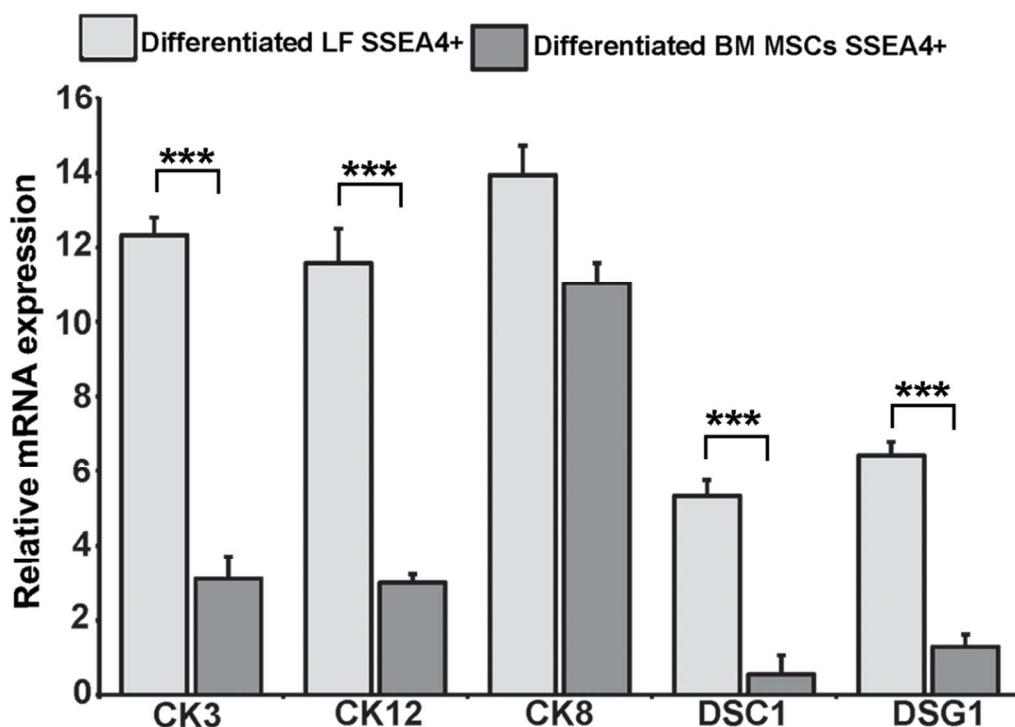

Supplementary Figure S2: Comparison of stem cell marker expression between 3D Matrigel and thin-coated Matrigel culture systems. The data represent the mean \pm SEM from 6 experiments. Statistical analysis was performed using Two tailed Student's *t* test (* $p<0.05$).

Supplementary data (Ula V. Jurkunas et al.)

Supplementary Figure S3: Ectodermal induction of LFs and BM MSCs. (A): LFs and (B): BM MSCs; mRNA levels of p63 and CK8, determined at 1, 3, 5, and 7 days post induction. The marker levels increased to their highest levels between days 3 and 5 as compared to day 1 of induction. The data represent the mean \pm SEM from 3 experiments. Statistical analysis was performed using Two tailed Student's *t* test ($*p < 0.05$).

Supplementary data (Ula V. Jurkunas et al.)

Supplementary Figure S4: Differentiation of LF SSEA4+ and BM MSC SSEA4+ cells into corneal epithelial cells. LF SSEA4+ cells show a higher significant differentiation potential into corneal epithelial cells than do BM MSC SSEA4+ cells. The data represent the mean \pm SEM from 6 experiments. Statistical analysis was performed using Two tailed Student's *t* test. (***(*p* < 0.001)).
