Supplementary Methods

Reagents, plasmids and antibodies.

The pLenti-Puro, pLVX-IRES-Puro and pLKO.1-Puro plasmids were purchased from Addgene. Lentiviral vector pLKO.1-Puro was used to clone small hairpin RNAs (shRNAs): KDM4A shRNA1 (target sequence: GCACCGAGTTTGTCTTGAAAT); KDM4A shRNA2 (target sequence: TTCGAGAGTTCCGCAAGATAG); KDM4A shRNA3 (target sequence: TAGTGAAAGGACGAGCCATTT); KDM4B shRNA1 (target sequence: GCGGCAGACGTATGATGACAT); KDM4B shRNA2 (target sequence: GCGGCATAAGATGACCCTCAT); KDM4B shRNA3 (target sequence: GATGACCTTGAACGCAAATAC). KDM4A and SUV39H1 cDNAs were cloned to pLenti-Puro to generate expression constructs, while KDM4B and HA-SETD2-M cDNAs were cloned to pLVX-IRES-Puro respectively.

Antibodies relevant to this article were from commercial suppliers and used for immunoblotting, immunofluorescence staining, ChIP-seq, ChIP-PCR or immunohistochemistry at optimized concentrations (details listed in Supplementary Table 10).

In vitro cell treatments and senescence appraisal.

Stromal cells were grown until 60%-80% confluent (CTRL) and treated with bleomycin (50 μg/ml, BLEO, MedChemExpress, cat. no. HY-17565), mitoxantrone (1 μM, MIT, Selleck, cat. no. S2485), doxorubicin (2 uM, DOXO, MedChemExpress, cat. no. HY-15142), cisplatin (10 μM, CIS, MedChemExpress, cat. no. HY-17565), carboplatin (20 μM, CARB, MedChemExpress, cat. no. HY-17393), satraplatin (20 μM, SAT, MedChemExpress, cat. no. HY-17576), docetaxel (100 nM, DTX, TOCRIS, cat. no. 4056), paclitaxel (100 nM, PTX, MedChemExpress, cat. no. HY-B0015), vincristine (50 nM, VCR, Selleck, cat. no. S1241) for 12 h. After treatment, the cells were rinsed twice with PBS and allowed to stay for 7-10 d in media.

Oncogenic HRAS^{G12V}-transduced cells were selected by puromycin for 3 d and allowed to stay for 7-10 d in media. Alternatively, the cells were allowed to passage consecutively for replicative exhaustion. SA-β-Gal staining assay was performed with a commercial kit (Beyotime) to examine cellular senescence. For cell cycle arrest, a single pulse of BrdU (10 μM, Yeasen) was performed for 24 h and cells were subject to immunofluorescence staining with an anti-BrdU antibody (1:400 dilution, Cell Signaling, cat no. 5292) before counterstained with DAPI and assessed by fluorescence microscopy. Alternatively, cells were exposed to ML324 (20 μM, MedChemExpress, cat. no. HY-12725), Bay 11-7082 (2 μM, Selleckchem, cat. no., S2913) or Chaetocin (10 nM, Selleckchem, cat. no. S8068), either alone or alongside other agents for specific assays.

DNA-damage extent was evaluated by immunostaining for γH2AX (primary dilution 1:500) or p53-BP1 (primary dilution 1:500) foci by following a 4-category counting strategy as formerly reported [1]. Random fields were chosen to show DDR foci, and quantified using CellProfiler (http://www.cellprofiler.org). For clonogenic assays, cells were seeded at 1 × 10^3 cells/dish in 10mm dishes for 24 h before treated with chemicals. Cells were fixed with 2% paraformaldehyde 7-10 d post treatment, gently washed with PBS and stained instantly with 10% crystal violet prepared in 50% methanol. Excess dye was removed with PBS, with plates photographed. Colony formation were evaluated by quantifying the number of single colonies per dish.

Quantitative RT-PCR.

Quantitative RT–PCR (qRT–PCR) was performed after RNA extraction using TRIzol (Thermo Fisher). RNA expression was determined with Universal SYBR Green Two-step kit (Yeasen) on a QuantStudio 7 Real-Time PCR System (Thermo). For normalization of human gene expression, *RPL13A* was used as an internal control, and the fold change was calculated using the 2-ΔΔC(t) method for all analyses (primer sequences listed in Supplementary Table 11).

Immunoblotting and immunofluorescence.

Proteins were separated using NuPAGE 4 to 12% Bis-Tris gels and transferred onto nitrocellulose membranes (Life Technologies). The blots were blocked with 5% nonfat dry milk at room temperature for 1 h and incubated overnight at 4°C with desired primary antibodies at concentration per the manufacturer's protocol, followed by incubation with horseradish peroxidase-conjugated secondary antibodies (Santa Cruz) at room temperature for 1 h. The membrane blots were developed with enhanced chemiluminescence (ECL) detection reagent (Millipore) per the manufacturer's protocol and detected through chemiluminescence using ImageQuant LAS 400 Phospho-Imager (GE Healthcare). As a standard protein marker, we used Thermo Fisher Scientific PageRuler Plus Prestained Protein Ladder (no. 26619).

For immunofluorescence staining, cells were cultured in dishes and pre-seeded for at least 24 h on coverslips. Upon brief washing, cells were fixed with 4% paraformaldehyde in PBS for 8 min, blocked with 5% normal goat serum (NGS, Thermo Fisher) for 30 min and incubated with primary antibodies diluted in PBS containing 5% NGS for 2 h at room temperature. Alexa Fluor 488 or 594-conjugated secondary antibodies (Invitrogen, 1:400) were used. Nuclei were stained with Hoechst 33342, with slides mounted with Vectashield medium. Fluorescence imaging was performed on a fluorescence microscope (Nikon Eclipse Ti S). Captured images were analyzed and processed with the Nikon DS-Ri2 fluorescence workstation and processed with NIS-Elements F4.30.01. Alternatively, a confocal microscope (Zeiss LSM 780) was applied to acquire confocal images (antibodies used for this study listed in Supplementary Table 10).

Chromatin fractionation and nuclear protein extraction.

To assess the levels of KDM4 family members at the chromatin-bound fraction, CTRL and BLEO-treated PSC27 cells were cross-linked with 1% formaldehyde for 5 min and quenched with 0.125 M glycine; then, cells were washed thrice with 1 × PBS, and incubated with buffer A (10 mM HEPES, pH 7.9, 10 mM KCl, 1.5 mM $MgCl_2$, 10% glycerol, 0.34 M Sucrose, 1 mM DTT, 0.1% Triton, PMSF, and protease inhibitor mixture) for 10 min at 4 °C. The cell lysates were centrifuged at 1,500 × g for 5 min at 4 °C, with supernatants removed. Pellets were resuspended in buffer B (3 mM EDTA, 0.2 mM EGTA, 1 mM DTT, PMSF, and protease inhibitor mixture) and incubated on ice for 10 min before centrifugation at 1,700 × g for 5 min at 4 °C. To prepare the chromatin-bound fraction, the pellets were incubated for 30 min at 37 °C with buffer A containing 1 mM $CaCl_2$ and 0.6 unit of MNase and centrifuged at 20,000 × g for 10 min at 4 °C, and the supernatant was collected and subjected to immunoblot analysis. For nuclear protein preparation, a Minute^{TM} Cytoplasmic and Nuclear Extraction Kit (Invent Biotechnologies, Inc. # sc-003) was used by following the manufacturer' procedure.

Stromal cell clonogenic assay.

PSC27 cells were trypsinized and counted with a hemocytometer. Two milliliters of DMEM full medium containing 500 cells were plated in each well of the six-well plates. The cells were maintained at 37 °C for 7 d to allow colony formation before stained with 0.5% crystal violet (Sigma-Aldrich) in absolute methanol. Colonies per well were counted and numbers were recorded from 3 independent experiments.

Cancer cell phenotype appraisal.

Epithelial cell proliferation was determined following the MTT procedure (Promega). Migration and invasion were assessed in culture using Transwells (Cultrex 24-well Cell Migration Assay plates) containing a porous (8 μm pore size) membrane uncoated (for the migration assay) or coated (for the invasion assay) with a 0.5 × solution of basement membrane extract and the indicated CM in the bottom portion of the well. After 24 h, migrating or invading cells on the bottom side of the porous membranes were stained and quantified by absorbance as recommended by the supplier.

Histology and immunohistochemistry.

Mouse tissue specimens were fixed overnight in 10% neutral-buffered formalin and processed for paraffin embedding. Standard staining with hematoxylin/eosin was performed on sections of 5-8 μm thickness processed from each specimen block. For immunohistochemistry, tissue sections were de-paraffinized and incubated in citrate buffer at 95 °C for 40 min for antigen retrieval before incubated with the indicated antibodies (for instance, anti-cleaved Caspase 3, 1:1000) overnight at 4 °C. After 3 washes with PBS, tissue sections were incubated with biotinylated anti-mouse IgG (1:200 dilution, Vector Laboratories) for 1 h at room temperature then washed thrice, after which streptavidin-horseradish peroxidase conjugates (Vector Laboratories, CA, USA) were added and the slides incubated for 45 min. DAB solution (Vector Laboratories) was then added and the slides were counterstained with haematoxylin.

SILAC sample preparation.

PSC27 cells were grown to 80% confluence in high glucose (4.5 g/L) DMEM media (with glutamine and sodium pyruvate) containing 10% FBS and 1% penicillin/streptomycin at 37 °C with 95% air and 5% CO2. Cells were either labeled with “heavy isotopic lysine” (^{13}C-lysine) or “light isotopic lysine” (^{12}C-lysine/arginine) using a SILAC protein quantitation kit (Pierce, Thermo) according to manufacturer’s instructions. Briefly, cells in the control group were labeled with L-$^{13}C_6$-Lysine/L-$^{13}C_6{}^{15}N_4$-Arginine as “heavy” class, while those in the experimental group were labeled with L-Lysine/L-Arginine as “light” class. In each case, cells were cultured for more than 6 generations before being harvested. At least 1 passage prior to the experiment, incorporation efficiency of the heavy labeled amino acids into proteins was assessed in a pilot experiment, where a small aliquot of intracellular protein was lysed, reduced, alkylated, and trypsin digested and subjected to mass spectrometric (MS) analysis as described below. Heavy label incorporation into proteins from control (non-senescent) cells was assessed as > 99%.

For the proteomics, 24 h before harvesting, plated cells (approximately 5 × 10^8 in fifteen 150 cm2 flasks) were washed thrice with fresh FBS-free medium for 10 min at 37℃ each. The cells were then incubated in FBS-free medium (12 ml per flask) for 24 h at 37℃. At the end of the culture period, cells showed no evidence of apoptosis. Samples were prepared for MS analysis including removal of phenol red dye by buffer exchange with 50 mM Tris-Cl (pH8.0) (5 washing steps using spin columns at 5000 × g). Samples were denatured with 6M urea, reduced with 20mM DTT (30 min at 37℃), alkylated with 50 mM iodoacetamide (30 min at RT), and digested overnight at 37℃ with 1:50 enzyme:substrate ratio (wt/wt) of sequencing grade trypsin (Promega, Madison, WI) as described [2]. Following digestion, samples were acidified with formic acid and desalted using HLB Oasis SPE cartridges (Waters, Milford, MA). Protein/peptide recovery was not specifically assessed, however, the above sample preparation and digestion protocol was thoroughly assessed for reproducibility during previous optimization and reproducibility studies. Hydrophilic Interaction Liquid Chromatography (HILIC) peptide fractionation was performed on a Waters 1525 HPLC system equipped with a 4.6 × 25 mm TSK gel Amide-80 HR 5 mm column (Tosoh Bioscience, South San Francisco, CA). Samples were loaded in 80% solvent B (98% acetonitrile, 0.1% TFA) and eluted with the following gradient: 80% B for 5 min followed by 80% B to 60% B in 40 min, 0% B in 5 min at 0.5 ml/min. Solvent A consisted of 98% HPLC grade water and 0.1% TFA collecting nine fractions.

Mass spectrometry.

Samples were analyzed by reverse-phase HPLC-ESI-MS/MS using an

Eksigent Ultra Plus nano-LC 2D HPLC system (Dublin, CA) connected to a quadrupole time-of-flight TripleTOF 5600 (QqTOF) mass spectrometer (SCIEX). Typically, mass resolution for MS1 scans and corresponding precursor ions was ~35,000 (TripleTOF 5600), while resolution for MS/MS scans and resulting fragmentions (MRM-HR transitions) was ~15,000 ('high sensitivity' product ion scan mode) [3]. Briefly, after injection, peptide mixtures were transferred onto the analytical C18-nanocapillary HPLC column (C18 Acclaim PepMap100, 75 mm I.D. × 15 cm, 3 mm particle size, 100A° pore size, Dionex, Sunnyvale, CA) and eluted at a flow rate of 300 nl/min using stepwise gradients from 5% to 80% solvent B with total runtimes, including mobile phase equilibration, of 90 min. Solvent mobile phase A was 2% acetonitrile/98% of 0.1% formic acid (v/v) in water, and mobile phase B was 98% acetonitrile/2% of 0.1% formic acid (v/v) in water. Data acquisition was performed in data dependent acquisition (DDA) mode on the TripleTOF 5600 to obtain MS/MS spectra for the 30 most abundant precursor ions (50 msec per MS/MS) following each survey MS1 scan (250 msec), yielding a total cycle time of 1.8 s as described [3, 4].

Bioinformatics database searches and SILAC quantification.

MS data were searched using the database search engine ProteinPilot (SCIEX Beta 4.5, revision 1656) with the Paragon algorithm (4.5.0.0, 1654). The search parameters were set as follows: trypsin digestion, cysteine alkylation set to iodoacetamide, SILAC Quantification (Lys-6, Arg-6, no bias correction), and Homo sapiens as species. Trypsin specificity was assumed as C-terminal cleavage at lysine and arginine. Processing parameters were set to ‘‘Biological modification’’ and a thorough ID search effort was used. During the search, Protein Pilot performs an automatic mass recalibration of the datasets based on highly confident peptide spectra. Specifically, a first search iteration was done to select high confidence peptide identifications to recalibrate both the MS and MS/MS data, which was subsequently automatically re-searched. During the iterative steps of re-searching the data, the search parameters were less stringent, e.g., allowing for additional ‘missed cleavages’ (with typically not more than 2).

All data files were searched using the SwissProt (2014-01, released January 22, 2014), with a total of 40,464 human ‘reviewed’ protein sequences searched. A cut-off peptide confidence value of 99 was chosen, and a minimum of 2 identified peptides per protein was required. The Protein Pilot false discovery rate (FDR) analysis tool, the Proteomics System Performance Evaluation Pipeline (PSPEP algorithm) provided a global FDR of 1% and a local FDR at 1% in all cases. For protein quantification comparing samples of senescent (light) *versus* presenescent (heavy) cells a Protein Pilot significance threshold of < 0.05 was required (all database search results and details for peptide identifications and protein quantification are provided in Supplementary Tables 1-3).

RNA-seq and data profiling.

Total RNA samples were obtained from stromal cells. Sample quality was validated by Bioanalyzer 2100 (Agilent), and RNA was subjected to sequencing by Illumina HiSeq X10 with gene expression levels quantified by the software package RSEM (https://deweylab.github.io/RSEM/). Briefly, rRNAs in the RNA samples were eliminated using the RiboMinus Eukaryote kit (Qiagen, Valencia, CA, USA), and strand-specific RNA-seq libraries were constructed using the TruSeq Stranded Total RNA preparation kits (Illumina, San Diego, CA, USA) according to the manufacturer’s instructions before deep sequencing.

Paired-end transcriptomic reads were mapped to the reference genome (GRCh38/hg38) with reference annotation from Gencode v27 using the Bowtie tool. Duplicate reads were identified using the picard tools (1.98) script mark duplicates (https://github.com/broadinstitute/picard) and only non-duplicate reads were retained. Reference splice junctions weree provided by a reference transcriptome (Ensembl build 73). FPKM values were calculated using Cufflinks, with differential gene expression called by the Cuffdiff maximum-likelihood estimate function. Genes of significantly changed expression were defined by a false discovery rate (FDR)-corrected *P* value < 0.05. Only ensembl genes 73 of status “known” and biotype “coding” were used for downstream analysis.

Reads were trimmed using Trim Galore (v0.3.0) (http://www.bioinformatics.babraham.ac.uk/projects/trim_galore/) and quality assessed using FastQC (v0.10.0) (http://www.bioinformatics.bbsrc.ac.uk/projects/fastqc/). Differentially expressed genes were subsequently analyzed for enrichment of biological themes using the DAVID bioinformatics platform (https://david.ncifcrf.gov/), the Ingenuity Pathways Analysis (IPA) program (http://www.ingenuity.com/index.html). Raw data were preliminarily analyzed on the free online platform of Majorbio I-Sanger Cloud Platform (www.i-sanger.com), and subsequently deposited in the NCBI Gene Expression Omnibus (GEO) database under the accession code GSE128282.

Venn diagrams

Venn diagrams and associated empirical *P*-values were generated using the USeq (v7.1.2) tool IntersectLists [3]. The t-value used was 22,008, as the total number of genes of status “known” and biotype “coding” in ensembl genes 73. The number of iterations used was 1,000.

RNA-seq heatmaps

For each gene, the FPKM value was calculated based on aligned reads, using Cufflinks. Z-scores were generated from FPKMs. Hierarchical clustering was performed using the R package heatmap.2 and the distfun = “pearson” and hclustfun = “average”.

Protein–protein interaction network

Protein-protein interaction (PPI) analysis was performed with STRING 3.0. The specific proteins meeting the criteria, were imported to NetworkAnalyst (http://www.networkanalyst.ca). A minimum interaction network was chosen for further hub and module analysis.

Gene set enrichment analysis (GSEA) of RNA-seq data.

For each differential expression analysis comparison, genes were ranked using “wald statistics” obtained from DESeq2 and GSEA was performed on these ranked lists on all curated gene sets available in MSigDB (http://software.broadinstitute.org/gsea/msigdb). DESeq2 independent filtering is based on mean of normalized read counts and filters out genes with very low expression level. The SASP and GSEA signatures were derived as described before [5].

ChIP-seq and ChIP-PCR.

ChIP experiments were performed as described previously [6] and ChIP-seq libraries were generated using NEBNext Ultra II DNA library preparation kit for Illumina according to the manufacturer’s protocol. Briefly, stromal cells were grown to ~80% confluence before crosslinked in 1% formaldehyde for 10 min at room temperature. Crosslinking was quenched by addition of glycine to a final concentration of 0.15 M for 5 min at room temperature, with crosslinked cells washed with ice-cold PBS, supernatant discarded, pellets flash-frozen in liquid nitrogen and stored at -80 °C. For each sample, 20 million fixed cells were lysed to prepare nuclear extracts. After chromatin shearing by sonication, lysates were incubated overnight at 4°C with protein A Dynabeads (Invitrogen) coupled with 5 μg of antibody. After immunoprecipitation, beads were recovered using a magnet and washed, with DNA eluted, cross-links reverted at 65°C for 4 hours then purified with Qiagen Kit. DNA was quantitated using the Qubit dsDNA HS assay and a Qubit 3.0 Fluorimeter (Invitrogen). For ChIP-seq, 5 ng of purified ChIP DNA were used to generate the sequencing library using the NEBNext ChIP-seq Library Prep Master Mix Set using modified Illumina TruSeq adaptors, and sequenced with Illumina Nova Seq 6000.

ChIP-seq data analyses were performed by DIATRE Biotechnology (Shanghai, China). Adapter sequences of ChIP-seq raw reads are removed by using cutadapt (https://doi.org/10.14806/ej.17.1.200). Trimmed reads are aligned by bowtie2 using default parameters to human genome (hg38). The samtools [7] and picard (http://broadinstitute.github.io/picard) were used to sort and remove duplicated reads to avoid PCR bias from the sequencing process. Each group of libraries after the above pre-processing is down-sampled (without replacement) to a fixed number of reads. Peak calling (identification of regions of ChIP-seq enrichment over background) was performed using MACS2 with parameters of ‘‘-extsize=146-nomodel’’, while the sonicated input served as a control and an initial threshold q-value of 0.01 was used as cutoff. The ‘‘broad peak’’ option is on when identifying binding regions of H3K9me3 and H3K36me3. Visualization of read count data was performed by converting raw bam files to bigwig files using IGV tools [8]. BETA or ChIP seeker was used to analyze expression data and binding data. Basic characteristics and QC of ChIP-seq libraries are available in Supplementary Tables 12-15.

Chromosomal positions were annotated according to the RefSeq database. In our annotation, a TSS region was defined as ±1 kb relative to the TSS. For density plots, we generated bigwig files allowing only one read per chromosomal position, eliminating potential spurious spikes. Each remaining read was extended from its 5′ end to a total length of 250 bases. Each bigwig file was also scaled to TPM (tags per million) based on the number of unique read positions. For density plots, the regions of ±5 kb for all annotated TSSs were divided into 100 equal-sized bins. All peaks with FDR greater than 5% were excluded from further analysis, with uniquely mapped reads used to generate the genome-wide intensity profiles. HOMER was employed to annotate peaks, to calculate overlaps between different peak files, and for motif searches. The genomic features (promoter, TSS, TES, exon, intron, 5‘ UTR, 3‘ UTR, and intergenic regions) were defined and calculated using Refseq and HOMER.

For ChIP-PCR, 10^7 cells were used per immunoprecipitation. The protein-chromatin complexes were purified by immunoaffinity captured by magnetic beads (Thermo Fisher Scientific), with the enriched DNA subjected to qPCR.

Briefly, immunoprecipitated chromatin complexes were eluted by DTT containing elution Buffer (10 mM DTT, 0.2% SDS in 1 × TE buffer) for 30 min at 37°C and then were further diluted 20-fold in a dilution buffer (10 mM Tris–HCl, pH8.0, 1 mM EDTA, 0.5 M EGTA, 100 mM NaCl, 1% Triton X-100 and protease inhibitor cocktail (Roche)), with DNA in the IP quantified by qPCR assays. The antibody used in ChIP-PCR was anti-KDM4A (abcam, # ab24545), with primers designed to amplify distal promoter regions (within -4kb TSS) of SASP hallmark factors or specified genes (sequences listed in Supplementary Table 16).

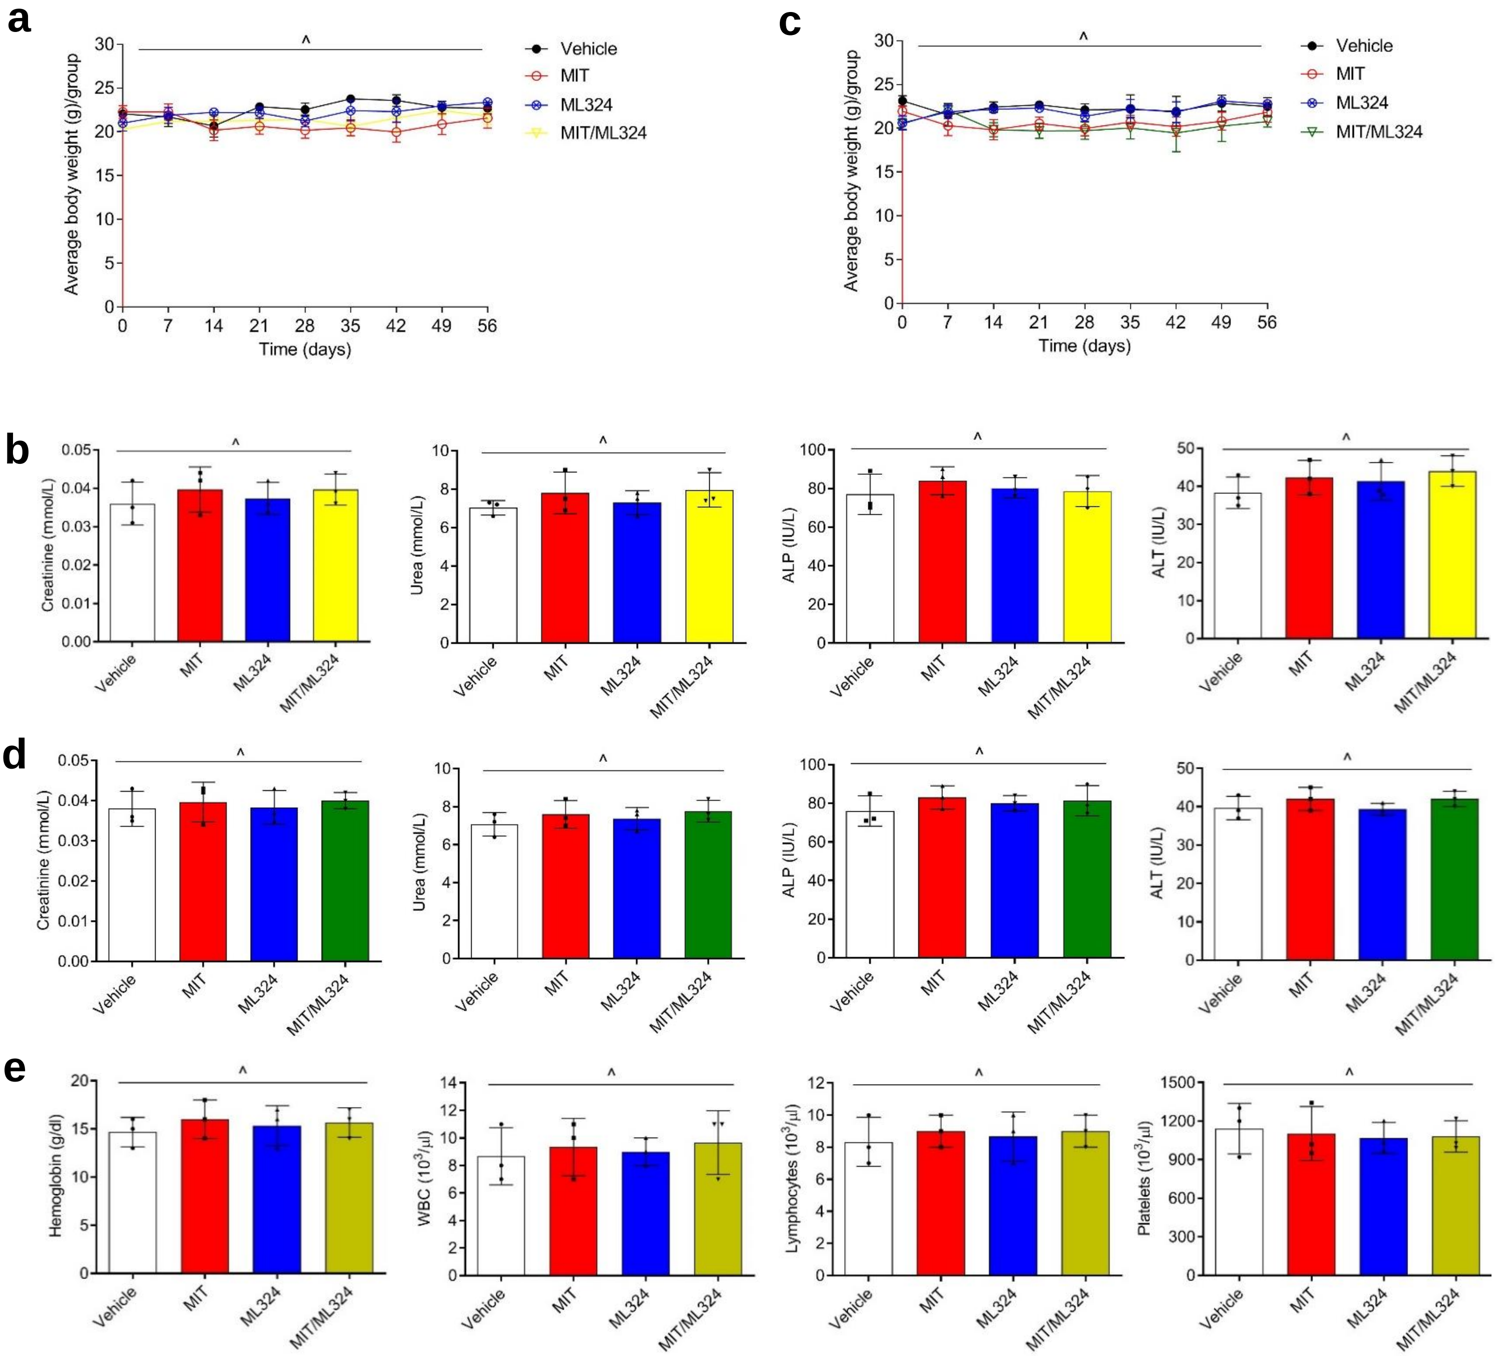
Differentially associated genes of H3K9me3

Differentially associated genes of H3K36me3

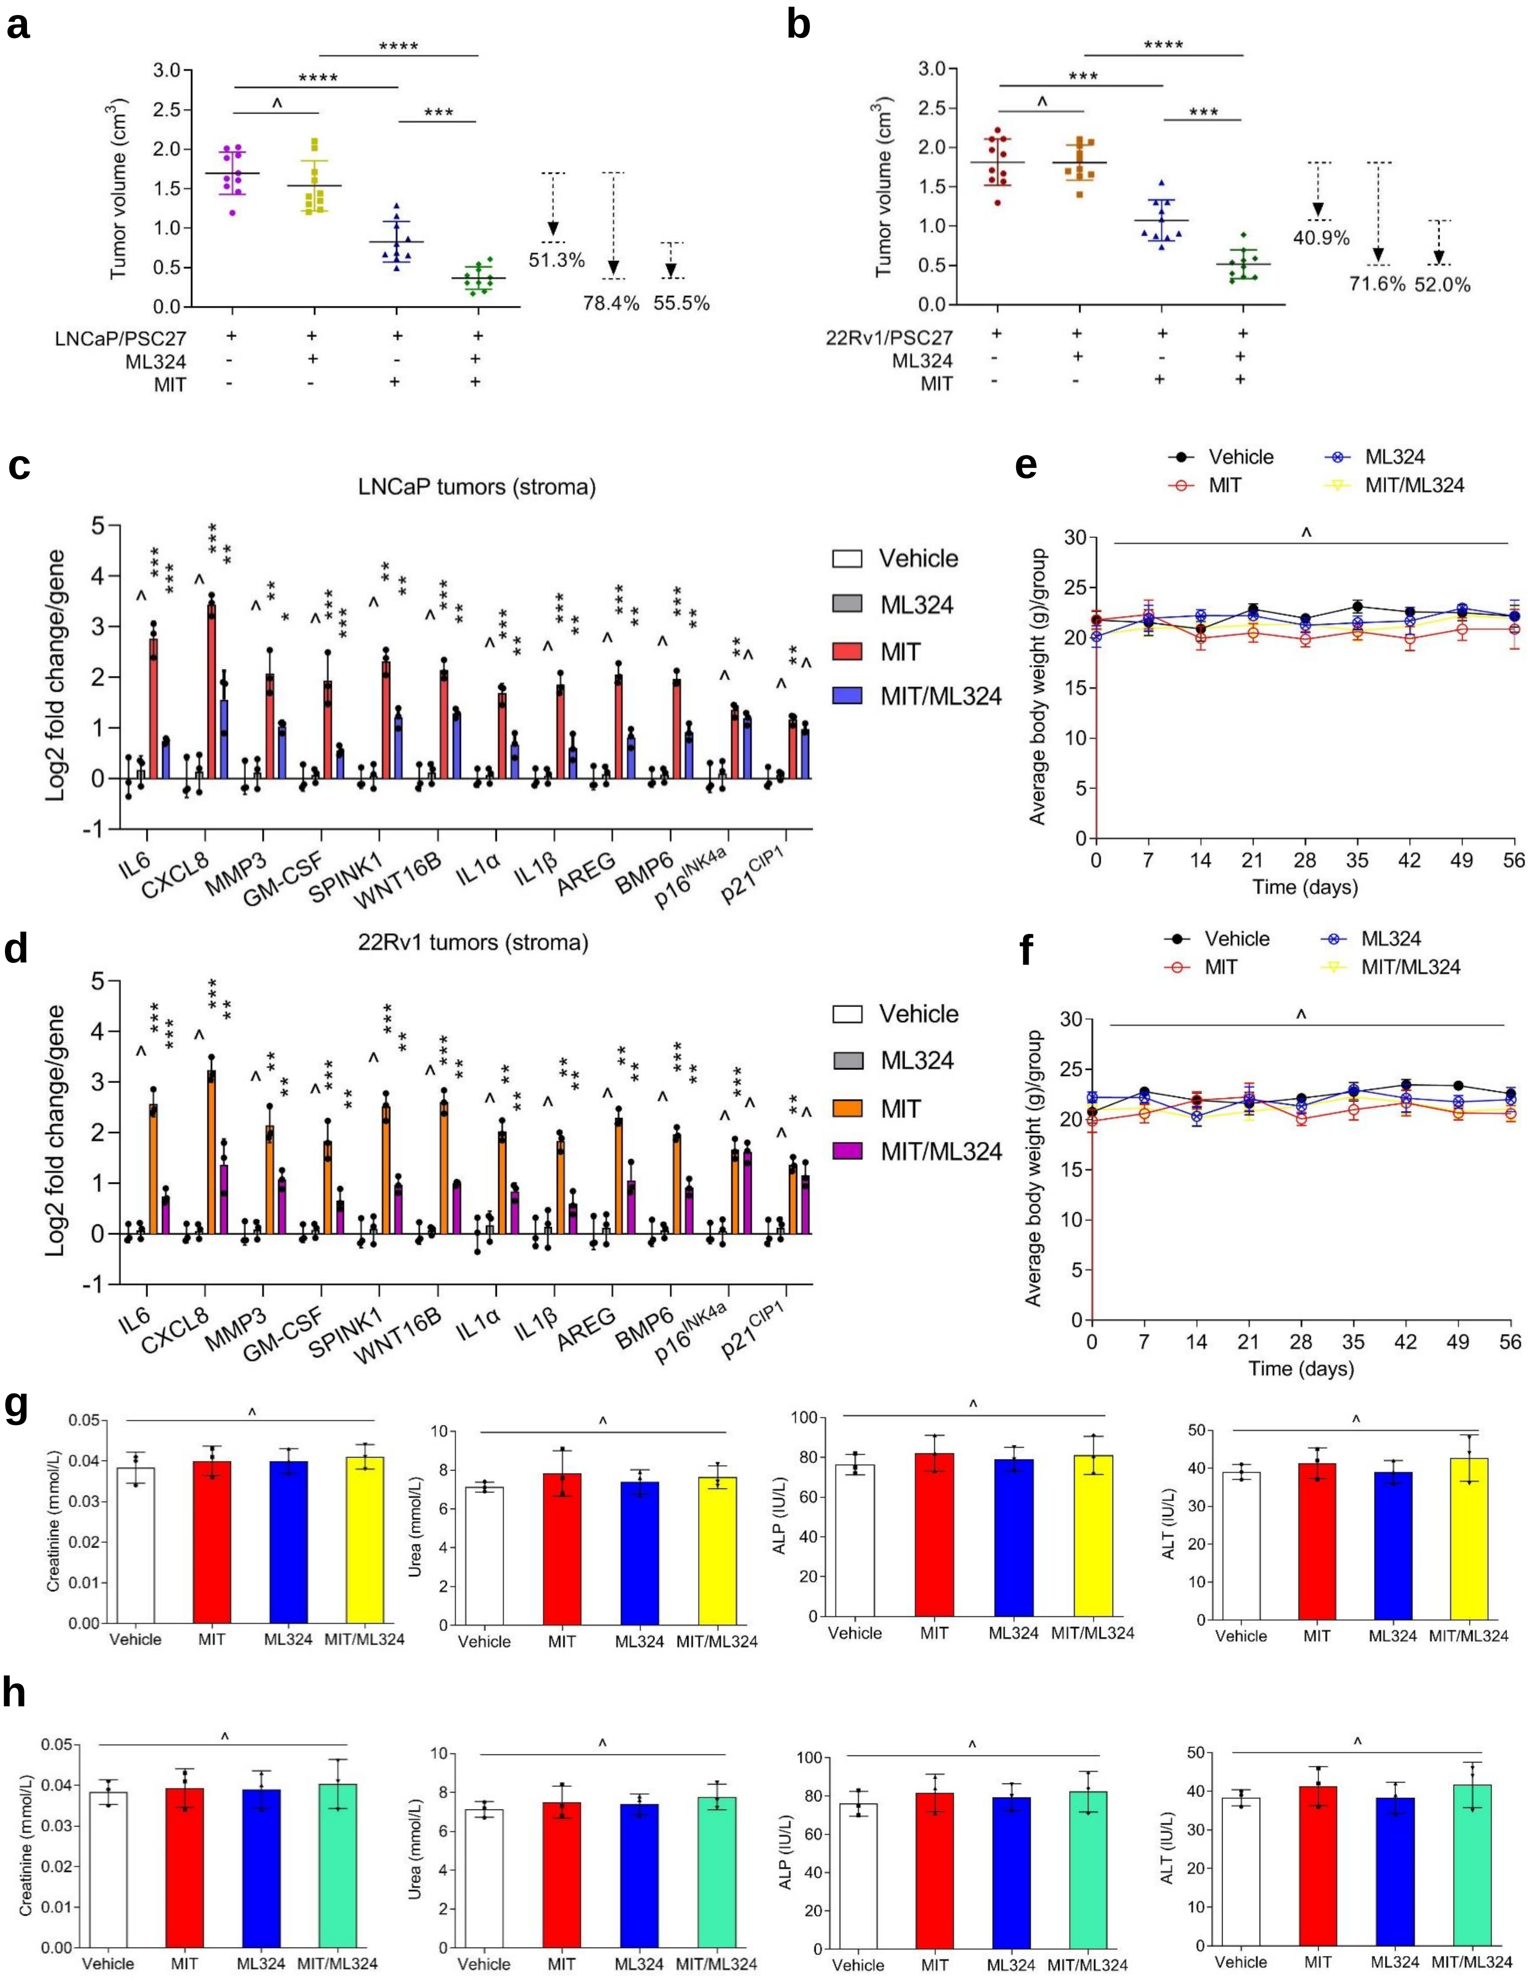
Supplementary Fig. 4. ChIP-seq mapping of H3K9m3 and H3K36me3 in human stromal cells (PSC27). a, Summary statistics of H3K9me3- and H3K36me3-specific peaks and their distribution across human genome. TSS, transcription start site. TES, transcription end site. BM, BLEO/ML324 co-treatment. **b**, Pie diagrams showing the distribution of differentially mapped H3K9me3 and H3K36me3 peaks between experimental conditions. BLEO vs CTRL, differential peaks of BLEO in contrast to those of CTRL. BM vs BLEO, differential peaks of BM in contrast to those of BLEO. The number of net peaks are indicated *per* comparative analysis. c, Venn diagrams displaying the number of genes that have regulatory regions containing binding sites for H3K9me3 or H3K36me3, and differentially mapped between conditions. Left, H3K9me3-associated genes down in ‘BLEO vs CTRL’ but up in ‘BM vs BLEO’. Right, H3K36me3-associated genes up in ‘BLEO vs CTRL’ but down in ‘BM vs BLEO’. The number of genes are shown *per* case.

Supplementary Fig. 5



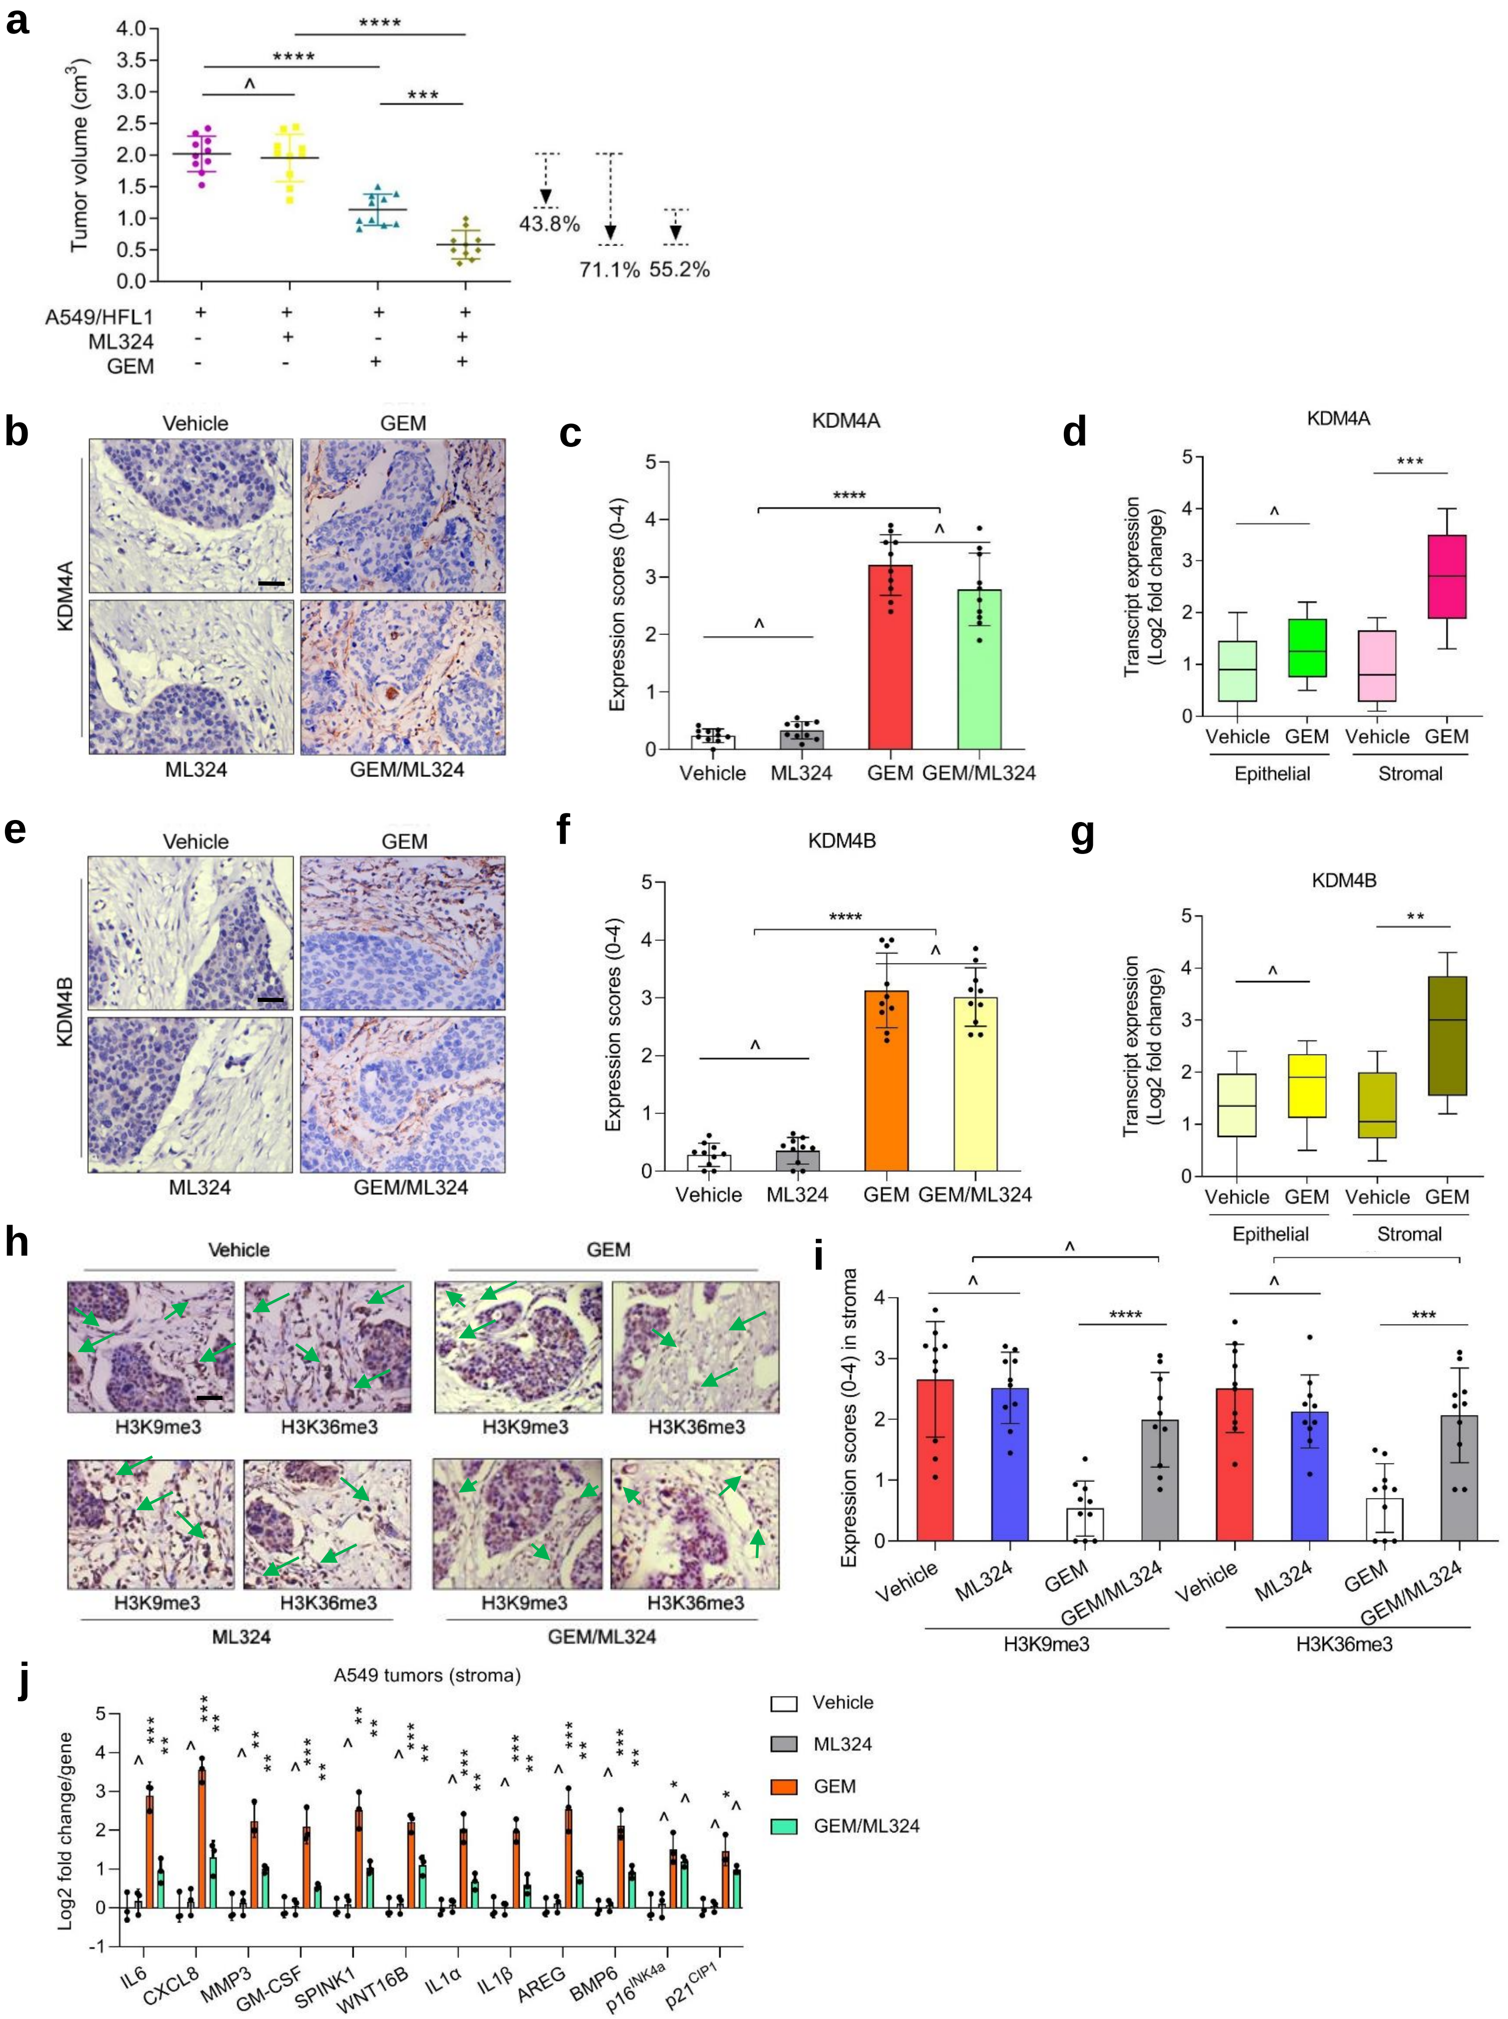
Supplementary Fig. 5. Pathophysiological evaluation of treatment effects on body weight and functional integrity of key organs. a, Mouse body weight determination performed on a weekly basis for immunodeficient mice. **b**, Serum measurement of creatinine, urea, alkaline phosphatase (ALP), and alanine aminotransferase (ALT) with terminal bleeds (cardiac punctures) taken at the end of therapeutic regimens. **c**, Mouse body weight determination performed on a weekly basis for immunocompetent mice (C57BL/6 strain). **d**, Serum measurement of creatinine, urea, alkaline phosphatase (ALP), and alanine aminotransferase (ALT) with terminal bleeds (cardiac punctures) taken at the end of therapeutic regimens for immunocompetent mice. **e**, Routine analysis of peripheral blood. The circulating levels of hemoglobin, white blood cells, lymphocytes and platelets at the end of each therapeutic regimen were assessed for C57BL/6 mice. Data are shown as mean ± SD and representative of 3 independent experiments. MIT, mitoxantrone. WBC, white blood count. For all pathophysiological assays, n = 3 per treatment arm. **a**-**e**, *P* values were determined by two-sided unpaired *t*-test, and adjusted for multiple comparisons. ^, $P > 0.05$.

Supplementary Fig. 6



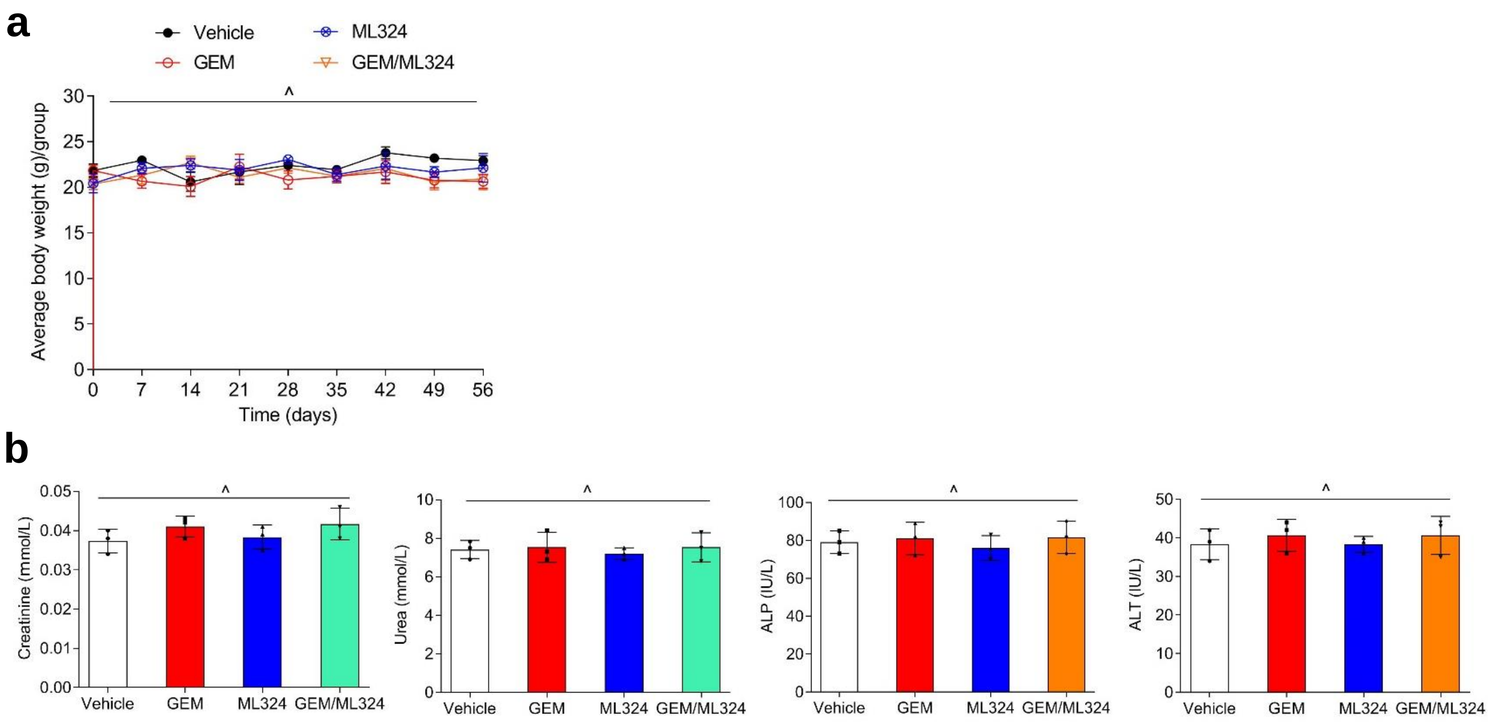
Supplementary Fig. 6. Tumor measurement, *in vivo* SASP expression, and pathophysiological assessment of animals bearing LNCaP/PSC27 or 22Rv1/PSC27 tumors. a, Comparison of tumor sizes at the end of preclinical treatment. Mice were implanted with androgen receptor (AR)-positive and hormone responsive LNCaP cells that were combined with PSC27 stromal cells, and experienced MIT and/or ML324-involving regimens. **b**, Similar comparison at described in (**a**), except that 22Rv1 cells were applied as an AR-positive and hormone-refractory PCa line for tumor xenografting. **c**, Quantitative transcript assay of SASP factors and senescence markers expressed in experimental LNCaP/PSC27 mice as described in (**a**). **d**, Quantitative transcript assay of SASP factors and senescence markers expressed in experimental 22Rv1/PSC27 mice as described in (**b**). **e**, Body weight measurement of LNCaP/PSC27 mice as described in (**a**). **f**, Body weight measurement of 22Rv1/PSC27 mice as described in (**b**). **g**, Serum measurement of creatinine, urea, alkaline phosphatase (ALP), and alanine aminotransferase (ALT) with terminal bleeds (cardiac punctures) taken at the end of therapeutic regimens for LNCaP/PSC27 animals. **h.** Serum analysis of creatinine, urea, alkaline phosphatase (ALP), and alanine aminotransferase (ALT) with terminal bleeds (cardiac punctures) taken at the end of therapeutic regimens for 22Rv1/PSC27 animals. Data are shown as mean ± SD and representative of 3 independent experiments. MIT, mitoxantrone. WBC, white blood count. For assays of (**a**), (**b**), (**e**) and (**f**), n = 10 per treatment arm. For tests of (**c**), (**d**), (**g**) and (**h**), n = 3 per group. **a**-**h**, P values were determined by two-sided unpaired *t*-test, and adjusted for multiple comparisons. ^, $P > 0.05$. *, $P < 0.05$. **, $P < 0.01$. *** $P < 0.001$. **** $P < 0.0001$.

Supplementary Fig. 7



Supplementary Fig. 7. Tumor measurement, *in vivo* expression of KDM4A/B, H3K9me3/H3K36me3 and the SASP in animals bearing A549/HFL1 tumors. a, Comparison of tumor sizes at the end of preclinical treatment. Mice were implanted with human lung adenocarcinoma cells (A549) that were combined with HFL1 lung fibroblasts, and experienced gemcitabine (GEM) and/or ML324-mediated regimens. **b**, Pathological examination of KDM4A in lung tumors by IHC staining after mouse dissection. Scale bar, 50 µm. **c**, Pathological scoring (in the range of 1-4, averaged from 3 independent readings/animal) of KDM4A expressed in fibroblasts isolated from mouse tumors via LCM. **d**, Comparative analysis of KDM4A expressed in epithelial cancer cells *versus* fibroblasts in tumor foci of animals experiencing different treatments. Cells were acquired from LCM-mediated isolation post tissue process. Signals normalized to the lowest value of cancer epithelial vehicle group. Median, 25th and 75th percentiles, with Turkey whispers indicated in box-and-whisker plots. **e**, Pathological examination of KDM4B in lung tumors by IHC staining after mouse dissection. Scale bar, 50 µm. **f**, Pathological scoring (in the range of 1-4, averaged from 3 independent readings/animal) of KDM4B expressed in fibroblasts isolated from mouse tumors via LCM. **g**, Comparative analysis of KDM4B expressed in epithelial cancer cells and fibroblasts in tumor foci. Cells were acquired from LCM-mediated isolation post tissue process. Signals normalized to the lowest value of cancer epithelial vehicle group. Median, 25th and 75th percentiles, with Turkey whispers indicated in box-and-whisker plots. **h**, Pathological examination of H3K9me3 and H3K36me3 in lung tumors by IHC staining after mouse dissection. Scale bar, 100 µm. Green arrows, representative stromal cells. **i**, Comparative statistics of H3K9me3 and H3K36me3 pathological scores (in a range of 1-4, averaged from 3 independent readings/animal) in lung tumors. **j**, Quantitative transcript assay of SASP factors and senescence markers expressed in experimental A549/HFL1 mice that experienced treatments as described in (**a**). Data are shown as mean ± SD and representative of 3 independent experiments. **a**, **c**, **d**, **f**, **g**, **i**, **j**, *P* values were determined by two-sided unpaired *t*-test, and adjusted for multiple comparisons. Data in **b**, **e**, **h** are representative of 3 biological replicates. ^, $P > 0.05$. *, $P < 0.05$. **, $P < 0.01$. *** $P < 0.001$. **** $P < 0.0001$. N = 10/group.

Supplementary Fig. 8



Supplementary Fig. 8. Pathophysiological evaluation of treatment effects on body weight and functional integrity of key organs of A549/HFL1 mice. Related to Fig. 7. a, Mouse body weight determination performed on a weekly basis for immunodeficient mice carrying A549/HFL1 tumors. b, Serum measurement of creatinine, urea, alkaline phosphatase (ALP), and alanine aminotransferase (ALT) with terminal bleeds (cardiac punctures) taken at the end of therapeutic regimens for A549/HFL1 animals. Data are shown as mean ± SD and representative of 3 independent experiments. GEM, gemcitabine. For all assays, n = 3 per treatment arm. **a**-**b**, *P* values were determined by two-sided unpaired *t*-test, and adjusted for multiple comparisons. ^, $P > 0.05$.

Supplementary Information

Supplementary Table 3. A representative list of proteins subject to remarkable methylation or demethylation in senescent cells.

A. Differentially modified sites summary (Filtered with threshold value of expression fold change, dimethylation)

Compare group	Regulated type	Fold change >1.2	Fold change >1.3	Fold change >1.5	Fold change >2
SEN/CTRL	up-regulated	(0)	(0)	(0)	(0)
	down-regulated	1 (1)	1 (1)	1 (1)	(0)

Protein accession	Position	Amino acid	Protein description	Gene name	Localization probability	PEP	Score	Modified sequence	Charge	Mass error [ppm]	MS/MS Count	CTRL	SEN	SEN/CTRL Ratio
Q71DI3	**36**	**K**	**Histone H3.2**	HIST2H3A	0.837398	0.0267953	64.22	KSAPATGGVK(0.837)K(0.16	4	-2.4441	1	5175500	15592000	**0.554**

B. Differentially modified sites summary (Filtered with threshold value of expression fold change, trimethylation)

Compare group	Regulated type	Fold change >1.2	Fold change >1.3	Fold change >1.5	Fold change >2
BLEO/CTRL	up-regulated	1 (1)	1 (1)	1 (1)	(0)
	down-regulated	3 (2)	3 (2)	2 (2)	(0)
