

Supplementary Figure 1, Additional File 7. Representation of the correlation between directly observed steps and steps derived from wearable technologies across all walking bouts. The X-Y scatterplot is representative of how tightly the wearable technology step counts hold to a linear relationship to directly observed steps across all walking bouts. X axis represents directly observed steps, and Y axis represents steps derived from wearable technology. Correlation coefficients (r) closer to 1.0 indicate tighter relationship (more precise) to directly observed steps.
