**Supplementary Figure 1**

Receiver operating characteristic (ROC) curve for the value of eosinophil and NLR changes after intravenous thrombolysis to predict (A): Poor outcome; (B): Death. Dynamic eosinophil had higher predictive ability than dynamic NLR for poor 3-month outcome ($p = 0.002$) and death ($p < 0.001$).

**Supplementary Figure 2**

**A**

**B**

Heat maps of proportion for (A): Poor outcome; (B): Death in the 10 groups established using eosinophil and NLR changes after intravenous thrombolysis. Numbers in the right of / represent the total patients in the group while numbers in the left of / represent the outcome event cases in the group.
