

Supplementary Information

Supplementary Figure 1: Matrix layout for all intersections of extreme responders for IAV-specific IgG levels and HAI titers at D49, D56, D63 and D146. Dark circles in the matrix indicate sets that are part of the intersection. The black bars on the left side of the figure indicate the total number of extreme high or low responders per group. The dotted line separates the two sets of high and low responder groups into subsets corresponding to early response (49 days of age on the boost day, three weeks after the first vaccine injection), the maximum intensity response at 56 and 63 days of age (one and two weeks after the boost) and the persistence of Ab response at 146 days of age (118 days post-vaccination).

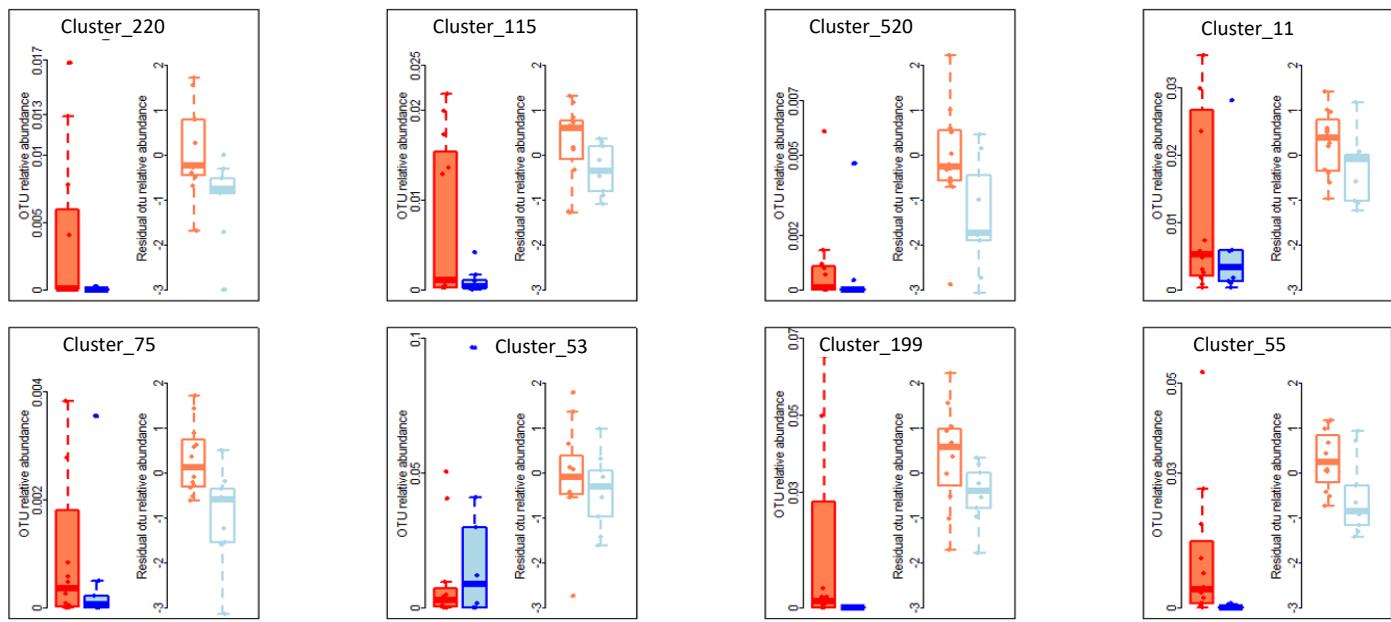

a**b**

Supplementary Figure 2: Evolution of the relative abundance of the main genera of fecal microbiota from D28 to D146. The relative abundances of all genera are represented by boxplots colored according to animal age; blue at D28 and an orange gradient from pale to dark for D49, D63, and D146. **a** Relative abundances of the ten main bacterial genera observed at D63, with their corresponding abundances at D28, D49, and D146. **b** Relative abundances of the nine main bacterial genera observed at D28, with their corresponding abundances at D49, D63, and D146. *Prevotella 9*, as the most abundant genus in the D63 fecal microbiota and the eighth most abundant genus in the D28 fecal microbiota, is represented only once. Corresponding data are available in Supplementary Data 3.

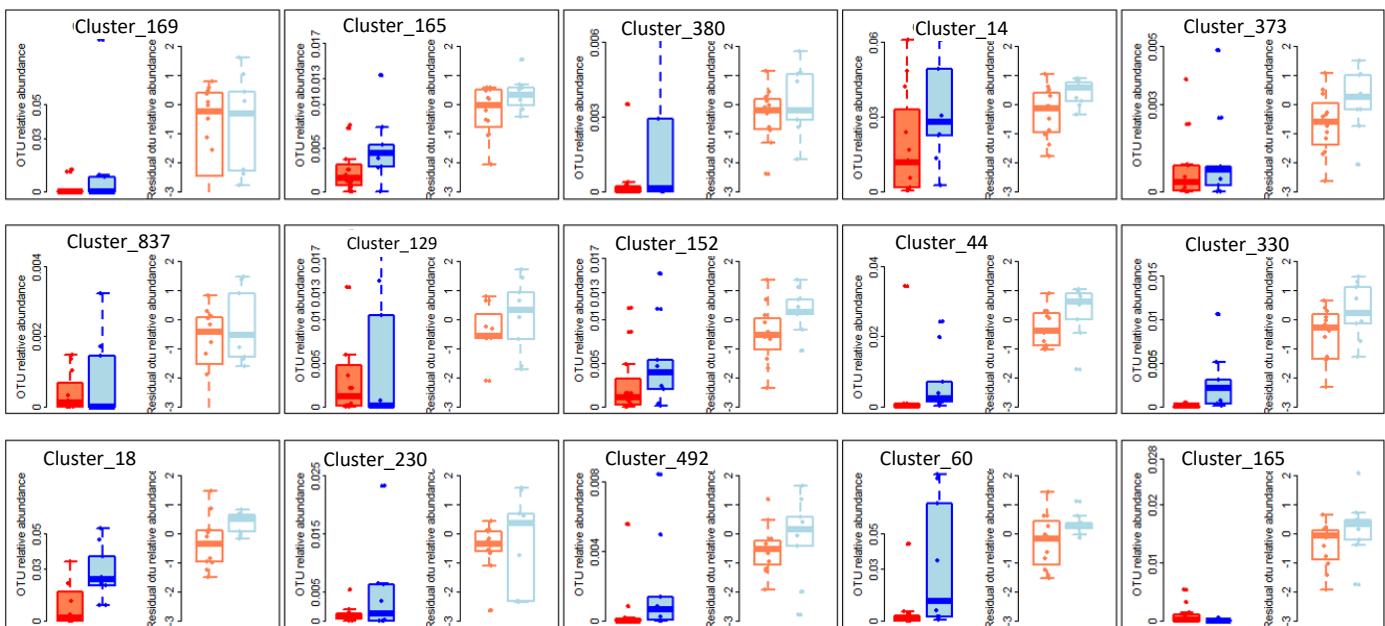

a**b**

Supplementary Figure 3. Composition of fecal microbiota of vaccinated pigs at D63 and visualization of clustering according to two enterotypes. **a** Relative abundances of bacterial genera in the fecal microbiota of 74 vaccinated pigs in which the composition of the fecal microbiota was followed from D28 to D146 (slaughter). Only genera with mean abundances over 1.8% are represented, with the exception of *Campylobacter* and *Treponema*. **b** Distribution of pigs between the enterotypes PM (*Prevotella-Mitsuokella*) and T (*Treponema*). Animals corresponding to enterotypes PM and T are represented by blue and red dots, respectively. All data are available in Supplementary Table 2 and in Supplementary Data 3.

a

b

Supplementary Figure 4. Details on the differential abundance of OTUs in the D28 fecal microbiota of high and low vaccine responders, measured by serum levels of IAV-specific IgG at D63. **a** Differential abundance of OTUs that were more abundant in high responders. **b** Differential abundance of OTUs that were more abundant in low responders. For each OTU, the first boxplot displays its relative abundance in the high (red) and low (blue) responders. The second boxplot displays the same data with normalization by metagenomeSeq package of the OTU counts for gender, weaning age, and batch, as these three variables had a significant effect on IAV-specific IgG levels and were consequently set as fixed effects in the model. All data are available in Supplementary Data 6.

Supplementary Table 1: Association between pig characteristics and diversity indices of OTUs in fecal DNA at D28 for the group of vaccinated pigs.

Age (day)	Zootechnical parameters	Alpha diversity		Beta diversity
		Richness	Shannon	
D28	Body weight at weaning	0.0031**	8.0 x 10⁻⁴**	0.0096**
	Batch	0.9638	0.8874	0.0016**
	Age at weaning	0.8816	0.2691	0.0001**
	Sex	0.4511	0.4134	0.5542

P-values are reported in the table and highlighted in bold letters where significant (* for p-value <0.05, and **for p-value<0.01). The effect of each zootechnical parameter on the alpha diversity was measured on the total vaccinated population using maximum likelihood ratio tests on linear models. Individual alpha diversity indices are available in Supplementary Data 5 for all animals. The effect of the beta diversity was measured with Bray-Curtis distances, and p-values were calculated with an Adonis test.

Supplementary Table 2: Summary of differentially abundant genera between the two fecal DNA enterotypes found at D63.

Supplementary Table 4: Composition of pig diets during the initial, post-weaning and growing periods.

	STARTING from 28 to 34 days of age	POST-WEANING from 35 to 68 days of age	GROWING from 69 days of age up to slaughtering
Granulometry (mm)	2.2	2.8	4
Ingredients (% dry matter feed)			
Barley	30.10	25.00	10.00
Cereal mixture	12.3	-	-
Wheat	-	38.35	39.89
Triticale	-	5.00	15.00
Corn	-	-	8.20
CELTI 50% ¹	49.95		
Wheat bran	-	1.8	-
Corn dregs	-	-	2.0
Rapeseed meal	-	-	9.5
Soybean meal 48	2.3	16.30	10.10
Expelled rapeseed meal	-	5.00	-
Toasted soybean	-	2.00	-
Calcium carbonate	-	0.41	0.78
Dicalcium phosphate	-	0.59	-
Salt	-	0.32	0.30
Dextrose	1.50		
Sodium bicarbonate	-	0.08	0.10
Cane molasses	1.00	-	1.5
Palm oil	0.8	0.2	-
Rapeseed oil	0.5	1.50	-
Methionine (liquid)	-	0.2	-
Methionine	-	-	0.03
L-LYSINE 50%	-	0.85	0.46
Choline (liquide)	0.05	-	0.05
Threonine	-	0.40	0.13
Bentonite clay (SMECTAGRI) ²	-	1.00	1.00
Phytase (BELFEED) ²	-	0.20	0.20
Phytase (NATUPHOS 5) ²	-	0.30	0.26
PROPHORCE AC600	0.5	-	-
AL 425 Digesta'Co ^{2,3}	0.5	-	-
VEVOVITALL ^{2,4}	0.5	-	-
CMV Post Weaning ^{2,5}	-	0.50	-
CMV Growing 0.5% ^{2,5}	-	-	0.50
Nutrients (% Dry matter feed)			
Crude fiber	3.3	4.15	3.86
Raw ash	6.5	5.76	5.55
Crude protein	17.5	17.49	16.03
Crude fat	6.0	4.03	1.82
Phosphorus	0.7	0.50	0.41
Sodium	0.2	0.16	0.16
Calcium	1.1	undetermined	undetermined
Chlorine/chloride	undetermined	0.26	0.28
Met tot	0.6	0.42	0.29
Met + Cys tot	undetermined	0.76	0.63
Lysine	1.5	1.37	1.01
Linoleic acid	undetermined	1.17	0.87
Digestible Energy (ED) (kcal)	undetermined	3274.00	3193.59
Energy (kcal)	2718.6	2350.83	2319.67

¹ blend of cooked wheat, wheat, soybean, cooked soybean, whey, soybean meal, coconut oil, calcium carbonate, potato protein, wheat extract, milk powder, dextrose, monocalcium phosphate, sodium chloride, vitamin A, D3, E, C, trace elements (Fe, I, Cu, Mn, Zn, Se, selenomethionine), food preservative (E324, E310), and dietary supplement (E1606, E954ii, 4a6, and 2b959).

² dietary supplement

³ Blend of calcium carbonate with wheat

⁴ benzoic acid (food preservative)

⁵ CMV multivitamin supplement

Supplementary Table 5: Number of vaccinated and non-vaccinated pigs at all experimental time-points and associated data.

	Age in days (D)	Vaccine response step	Pigs	Fecal samples		seric IAV-specific IgG data				HAI ² data			
				collected	exploited sequencing data ¹	D49	D56	D63	D146	D49	D56	D63	D146
Vaccinated pigs	D28	Before vaccination	98	92	89	89	88	86	80	84	88	86	78
	D49	Early (before booster vaccination)	98	98	97	97	96	94	88	92	96	94	86
	D56	Maximum intensity (after booster)	-	-	-	98	98	95	89	93	97	95	88
	D63	Maximum intensity (after booster)	98	98	98	98	97	95	89	93	97	95	87
	D146	Persistence (before slaughtering)	83	83	83	83	82	81	83	78	82	80	81
Non-vaccinated pigs	D28	Before vaccination	33	33	29	-	-	-	-	-	-	-	-
	D49	-	33	33	33	-	-	-	-	-	-	-	-
