Legend: Reaction Times (RTs ± SD), Accuracy (Acc in %), and number of Outliers are reported for each experimental condition.

Supplementary Figure 1. Individual data of the validity effect (RTs for Invalid-Valid) for the Exogenous (a) and Endogenous (b) tasks across conditions.

Supplementary Note

As recently shown by neuroimaging studies, the human brain undergoes functional and structural neuroplastic changes after long-term periods of simulated (1-4) and real (5-10) microgravity. Neuroplastic brain changes are thought to occur as adaptive response to altered sensorimotor functioning (e.g., vestibular and proprioception senses and motor control), but also to brain unloading and fluids shift. While structural brain changes need time to occur, functional brain changes have also been reported during PF periods of weightlessness (11, 12) and following PF (13). PF functional changes, as measured by ERP signals (11) during PF or fMRI after PF (13), seem to mainly involve areas belonging to attentional networks, i.e. the right Supramarginal Gyrus, a structure belonging to TPJ (13). We may speculate that our findings might represent one of the behavioural correlates of PF functional changes. Future studies, concurrently collecting behavioural and neuroimaging measures, are necessary to unequivocally establish the neural bases of the observed cognitive effects.
