Table S1. Summary of Adverse Events by Maximum Severity and MedDRA Preferred Term

Intent-to-Treat (Safety) Population

Note: Patients are counted once for each preferred term and once for each system organ class (SOC) per the greatest severity. SOC's are sorted in alphabetic order, and preferred terms are sorted in alphabetic order within SOC's.

The primary analysis of FEV1 considered American Thoracic Society/European Respiratory Society grades A-E acceptable, and U-F unacceptable. Using that threshold, all but 1 patient could perform spirometry acceptably for FEV1 on day 1. However, 24.2% of these evaluations were grade E, the lowest acceptable grade, due to a difference between the 2 highest attempts >0.200L. This proportion decreased progressively to 9.6% at day 180, presumably as an effect of treatment. To assess the potential influence of uncertainty regarding measurement of FEV1 on study findings, we performed a post-hoc analysis in which only grades A-D were considered (above). The analysis examined differences from control at month 6, before and after adjustment for differences in day 1 FEV1 values. These results confirmed the findings of the primary analysis. ^aAnalyses were adjusted for baseline differences in FEV1.

Table S7. Effects on FEV1 over time in the mITT population using a random effects model.

Treatment arm	Difference from control for the slope parameter		
	Coefficient	95% CI	P-value
CC-11050	.030	.004; .055	0.021
Everolimus	.022	-.003; .048	0.083
Auranofin	.000	-.025; .025	0.999
Ergocalciferol	.016	-.009; .041	0.218

We fit a random effects model for the repeated measurements of FEV1% linearly associated with study day to day 180. It included an interaction between study arm and day. The significance level of the overall interaction was P=0.07. Table S7 shows the difference from control in the slope parameter according to treatment arm. A model using ln(FEV1%) performed similarly (P=.04), as did others that included a quadratic term for day (P=.07 to .08). These findings are consistent with the analysis reported in table 3.

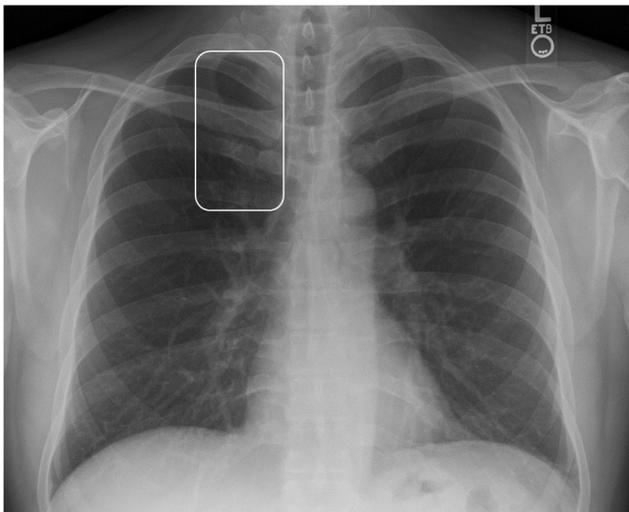

Table S8. Criteria for classifying radiographic extent of disease in tuberculosis.

Adapted from Diagnostic standards and classification of tuberculosis, National Tuberculosis Association, 1940

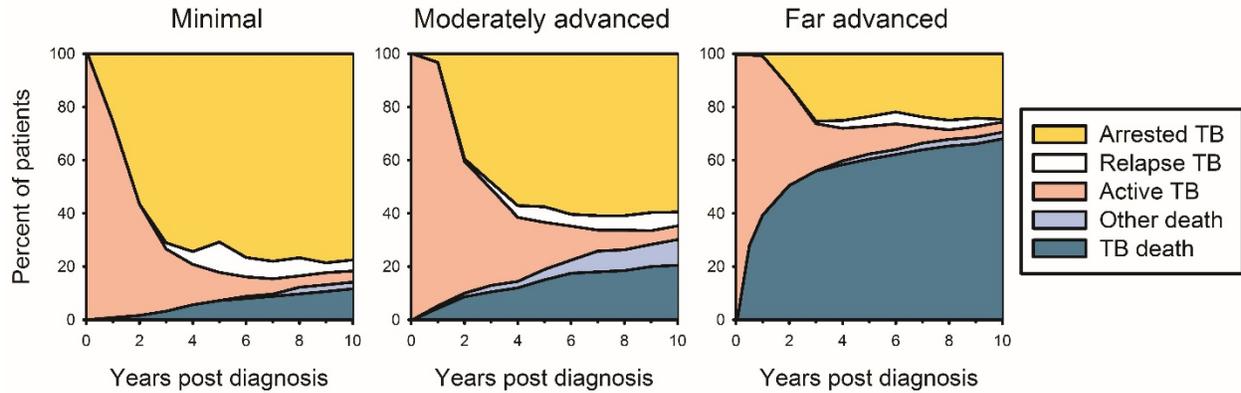

Slight to moderate density lesions total volume	see note 1 below	<input checked="" type="checkbox"/>		
	between note 1 and 1 lung		<input type="checkbox"/>	
	>1 lung			<input type="checkbox"/>
Dense or confluent lesions total volume	0	<input checked="" type="checkbox"/>		
	between 0 and 1/3 lung		<input type="checkbox"/>	
	>1/3 lung			<input type="checkbox"/>
Cavity total diameter (see note 3 below)	0 cm	<input checked="" type="checkbox"/>		
	between 0 and 4 cm		<input type="checkbox"/>	
	≥4 cm			<input type="checkbox"/>
Overall extent of disease	minimal	<input checked="" type="checkbox"/>		
	moderately advanced		<input type="checkbox"/>	
	far advanced			<input type="checkbox"/>

Notes:

1. To qualify as minimal disease, lesions must be of slight to moderate density only, and must occupy no more than the volume defined by the 2nd chondrosternal junction and the spine of the fourth or the body of the fifth thoracic vertebra on one side (see below)
2. Please note that although total volume may be compared to that of 1 lung, it may be distributed across both lungs
3. If conventional full size films are used, total cavity diameter may be measured directly. For other image types, a scaling factor may be applied if one is provided. Otherwise, the width of the anterior portion of the 3rd or 4th rib may be used to approximate 1 cm.
4. All checks must be in white for minimal disease
5. Any checks in black result in far advanced disease
6. Everything else is moderately advanced disease

Natural history of pulmonary tuberculosis in the pre-chemotherapy era, according to radiographic extent of disease at diagnosis. From Alling DW and Bosworth EB. The after-history of pulmonary tuberculosis. ARRD 81:839-849, 1960.

To be classified as “arrested TB”, constitutional symptoms must be absent, sputum if any, must be ... microscopically negative for tubercle bacilli, lesions stationary and apparently healed according to X-ray examination with no evidence of pulmonary cavity. These conditions shall have existed for a period of six months, during the last two of which the patient has been taking one hour's walking exercise twice daily or its equivalent.
