

Figure S2. The transfection efficiency was verified by immunofluorescence and Western blotting. The KO RAW 264.7 cells were transfected respectively with GFP, 2K-R, 3K-R, 5K-R, and WT HMGN2 plasmids for 24 h. (A) The microscopic images displaying transfection efficiency of plasmids in each group (100x), scale bar = 200 μ m. (B) Western blot showing the HMGN2 protein level in each group, and WT RAW 264.7 cells were used as a positive control.
