

Supplementary Table 2: Correlations between effect sizes of traits and tissues eQTLs for variants within the NNT gene. Related to figure 5.

	GTEx Single-Tissue eQTL, normalized effect size <sup>§</sup>	
Trait (UK Biobank) <sup>£</sup>	Skin - Not Sun Exposed (Suprapubic)	Skin - Sun Exposed (Lower leg)
Skin color (pigmentation) <sup>§</sup>	-0.686	-0.262
Sun protection use	-0.438	-0.848
Ease of skin tanning *	-0.407	-0.839

\* Following the Fitzpatrick's Skin phototypes' classification, higher values of this phenotype actually represent less tanning but easier burn.

<sup>£</sup> Effect size from GWAS of these phenotypes.

<sup>§</sup> The normalized effect size (NES) of the eQTLs is defined as the slope of the linear regression, and is computed as the effect of the alternative allele (ALT) relative to the reference allele (REF) (i.e., the eQTL effect allele is the ALT allele).
