eMethods 1. Participating hospitals in CSCA

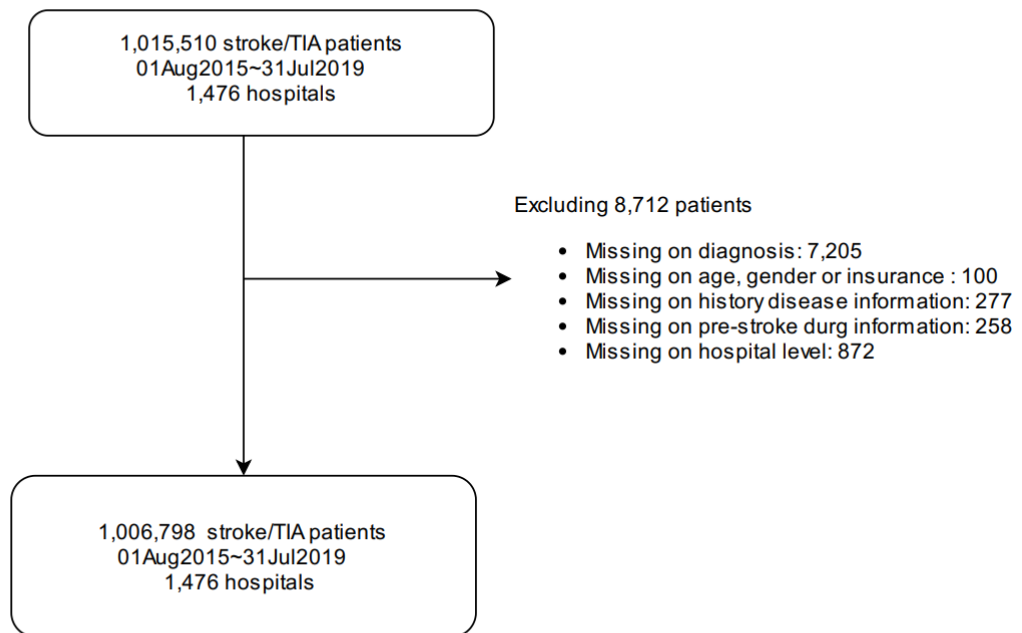

CSCA was made available to all secondary and tertiary hospitals in China. Secondary hospitals are regional hospitals with 100 to 500 beds that provide comprehensive medical care, as well as medical education and medical research on a regional basis. Secondary hospitals are usually located in a medium-sized city, county, or district. Tertiary hospitals are usually located in city centers with more than 500 beds, and they serve as medical hubs for multiple regions, with comprehensive and specialized medical care being provided. Hospitals participating in CSCA covered every province of China. Detailed distribution can be found in eFigure 1 and eTable 1.

Yearbook 2018

eTable 2. Specifications of guideline-recommended performance measures

Performance measure of ischemic stroke care	Performance measure definition for eligible patients
Admission performance measures	
IV-rtPA < 4.5 Hours	Intravenous recombinant tissue plasminogen activator (IV rtPA) in patients who arrive within 3.5 hours after initial symptom onset and treated within 4.5 hours
Early antithrombotics	Antithrombotic therapy prescribed within 2 days of hospitalization, including antiplatelet or anticoagulant therapy
DVT prophylaxis	Patients at risk for deep vein thrombosis (DVT) (non-ambulatory) who received DVT prophylaxis by end of hospital day two, including pneumatic compression, warfarin sodium or heparin sodium
Dysphagia screening	Dysphagia screening prior to any oral intake
Rehabilitation assessment	Assessed for stroke rehabilitation services
Performance measures at discharge	
Antithrombotic medication	Antithrombotic therapy prescribed at discharge
Anticoagulation for atrial fibrillation	Anticoagulation prescribed at discharge for patients with atrial fibrillation or atrial flutter documented during the hospitalization
Antihypertensive medicines for patients with hypertension	Antihypertension medication prescribed at discharge for patients with history of hypertension disease or hypertension disease documented during the hospitalization
Hypoglycemia medication for diabetes	Hypoglycemic medication prescribed at discharge for patients with history of diabetes mellitus or diabetes mellitus documented during the hospitalization
Statin for lowering low-density lipoprotein ≥ 100 mg/dL or not documented	Statin prescribed at discharge if low-density lipoprotein (LDL) ≥ 100 mg/dL, if patient treated with lipid lowering agent prior to admission, or LDL not documented.

Smoking cessation intervention	Smoking cessation intervention (counseling or medication) prior to discharge for current or recent smokers
--------------------------------	--

Eligible patients are those without any medical contraindications (e.g., treatment intolerance, excessive risk of adverse reaction, patient/family refusal, or terminal illness/comfort care only) documented as reasons for non-treatment for each of the applicable measures. Acute performance measures, except for rt-PA measure, exclude patients who died before the end of hospital day two. Performance measures at discharge exclude patients who died during hospitalization.

eTable 3. Trend analysis of quality measurement
