#### Abstract

Background: The Government of Pakistan is facing difficulty to contain the surge of Covid-19 due to the country's social, political, economic, and cultural context. Experiences from the previous epidemic suggest that community perceptions, social norms, and cultural practices can impede the containment of Covid-19. To understand social responses towards Covid-19, the study aims to explore the understanding of Covid-19 and acceptance of control measures among community members. 

Methods: We conducted an exploratory qualitative study using a purposive sampling approach, at two communities of Karachi, Pakistan. In-depth interviews were conducted with community members including, young, middle-aged, and older adults of both genders. Study data were analyzed manually using the conventional content analysis technique. 

Results: A total of 27 in-depth interviews were conducted, between May and June 2020. Six overarching themes were identified: (I) Community knowledge and perceptions around Covid-19; (II) Trusted and preferred sources of health information; (III) Initial thoughts and feeling towards Covid-19 pandemic; (IV) Community practices to prevent exposure from Covid-19; (V) Perceived risks associated with poor adherence to infection control practices; and, (VI) Future preparedness of community to avoid the second wave of the outbreak. Generally, community members had good knowledge about Covid-19, and positive behavior and attitude towards using standard precautions. The knowledge is mainly acquired through electronic, print and social media platforms, which has pros and cons. However, some community members including younger individuals had poor adherence to safety measures. This may necessitate concentrated efforts to raise awareness through community mobilization and sensitization activities. 

Conclusion: This study provides an initial evidence base of communities' perceptions, and attitudes towards Covid-19 in an early stage of pandemic. The study emphasizes that sufficient knowledge and awareness about Covid-19, adequate training and drills, and adherence to safety measures, are necessary to better prepare for the second wave of Covid-19.

Keywords: Covid-19, community perceptions, public health, exploratory qualitative study, Pakistan

Word count (excluding title page, references, figures and tables): 4,295

## 64 Strengths and limitations of this study

- This study provides an initial evidence base of communities' perceptions, and attitudes towards Covid-19 in an early stage of the pandemic when the communities just start to learn about the Covid-19 virus.
  - The use of conventional content analysis helped understand in-depth views of communities' perspectives and attitudes towards the Covid-19 pandemic
- The study invited participants from two communities of Karachi; therefore, our data might have missed views, from other major ethnic and cultural groups.
- One limitation is that to minimise the risk of infection all study respondents were interviewed online over Zoom and hence the authors did not have the opportunity to build rapport with the respondents or obtain non-verbal cues during interviews.

or open teries only

#### Background

By July 7, 2020, the failure to control the Covid-19 outbreak had resulted in 11,772,101 Covid-19 cases and 541,513 deaths worldwide.<sup>1</sup> As of July 7, 2020, Pakistan has recorded more than 234,509 Covid-19 cases with 4,839 deaths.<sup>2</sup> On February 26, 2020, the first case of Covid-19 was reported from Karachi.<sup>3</sup> The cases are increasing exponentially since the lockdown was lifted in late May, 2020.<sup>4</sup> The Government of Pakistan is facing difficulty to contain the surge of Covid-19 due to the country's social, political, economic, and cultural context. The increased resistance by communities and local and religious leaders have made it even more challenging to slow down the spread of Covid-19.5 

- There have been many generalized and subjective explanations of community interactions with Covid-19 and its control activities. In Pakistan, the initial response of the communities to the rising threat of Covid-19 was that of a generally reported apathy and indifference.<sup>6</sup> Despite several public health messages by Health Ministry<sup>7</sup>, communities are not adhering to the infection control precautions which are regularly reinforced through mainstream media. The non-cooperative attitude displayed by the public has further fueled the rapid transmission of the disease across the country.<sup>8</sup> Community practices, and attitudes towards Covid-19 have been described as barriers to an effective response.<sup>9</sup> Experiences from the previous epidemic suggest that community perceptions, social norms, and cultural practices can impede containment of Covid-19.<sup>10</sup> The fight against Ebola in Africa was subjected to similar challenges.<sup>11</sup>
- A large body of evidence supports the value of qualitative methods in epidemic and pandemic research. Leading global health agencies like the World Health Organization (WHO) and the Centers for Disease Control and Prevention (CDC) recommend using qualitative methods in epidemiologic investigations to capture social responses to the pandemic.<sup>12</sup> So far various quantitative studies have been conducted on Covid-19 to study the epidemiology of the disease. However, these studies are not well suited to capture the social implications of disease including the reasons for individuals' behavior, the social connections, or the ways families make sense of what is happening around them. Qualitative lessons from recent epidemics like SARS, H1N1, and EVD<sup>10</sup> highlight how to engage with the social, cultural, and political facets of the epidemic to build effective interventions.<sup>12</sup>
- To understand social responses towards Covid-19, it is important to explore the understanding of Covid-19 and acceptance of control measures among the community. Given the significance of qualitative inquiry, the current situation in Karachi, Pakistan demands an exploration of community perceptions, attitudes, practices regarding the Covid-19 pandemic. The open-ended nature of the study will help focus on how individuals and communities perceive Covid-19 disease.
  - Methods

#### Study design and setting

- This study utilized an exploratory qualitative research design using purposive sampling approach. The study was conducted in two communities of Karachi city. These include Karimabad Federal B Area Block 3 Gulberg Town, and Garden East and Garden West area of Karachi city.
- Karimabad is a neighborhood in the Karachi Central district of Karachi, Pakistan. It is situated in the south of Gulberg Town bordering Liaquatabad, Gharibabad, and Federal B. Area. The population of this neighborhood is predominantly Ismailis. People living here belong mostly to the middle class to the lower middle class. It is also known for its wholesale market for sports goods and stationery.
- Garden is an upmarket neighborhood, which is in the Karachi South district of Karachi, Pakistan. It is subdivided into two neighborhoods: Garden East and Garden West. It is the residential area around the Karachi Zoological Gardens, hence it is popularly known as the 'Garden' area. The population of Garden used to be primarily Ismaili and Goan Catholic but has seen increasing numbers of Memons, Pashtuns, and Baloch. These areas have been selected purposively to interview members of these communities.

#### 3 133 Data collection methods and study participants 4 134 The data collection methods included in denth i

The data collection methods included in-depth interviews (IDIs) with community members. The IDIs aimed to explore community perceptions, attitudes, practices regarding the Covid-19 pandemic in Karachi, Pakistan. Adult community members of different ages and both genders who have not contracted the disease were purposively recruited from both sites, as mentioned in the below table 1.

## 139 Table 1 Study participants for IDIs

| In-depth interview Participants  | Total IDIs= 27 | Male=12; Female=14 |
|----------------------------------|----------------|--------------------|
| Young adults (18 -35 years)      | 12             | Male=6; Female=6   |
| Middle-aged adults (36-55 years) | 8              | Male=4; Female=4   |
| Older adults (> 55 years)        | 7              | Male=3; Female=4   |

## 15 140

> Since this study aimed to explore general community perceptions, attitudes, practices regarding the Covid-19 pandemic, participants were excluded if they have been tested positive for Covid-19 or have been isolated/quarantined because of recent exposure. Because Covid-19 survivors and their family members might have different perceptions compared to the general community.

## 146 Data collection procedure

A semi-structured interview guide was developed by ASF and NAA for conducting IDIs (Additional File 1). The interview guide included questions on socio-demographic characteristics, community knowledge, perceptions, and attitudes towards Covid-19, community practices to prevent exposure from Covid-19, perceived risks associated with poor adherence to safety measures, and perceptions on future preparedness for the second wave of Covid-19. The interview guides were pilot tested with a non-study sample (2 IDIs) with the same characteristics as the study sample. The pilot testing offered evidenced-base guidance to improve data collection guides. 

#### 

The IDI participants were identified and contacted via the community WhatsApp group and email. Interviews were scheduled for participants' convenient day and time. Before beginning the interview, the study investigators explained the study objectives and procedures to eligible community members and obtained informed consent for their participation in the study. Informed consent was also obtained on either email or WhatsApp, for notetaking and audio recording of the interviews. Participants who were unable to write their names were asked to provide a thumbprint on the consent form to symbolize their consent to participate. Trained researchers, experienced in qualitative research, conducted online interviews via Zoom or Skype. At the start of the interview, each participant was asked to provide socio-demographic details including age, gender, educational level, and occupation. The interviews were conducted in the languages of English and/or Urdu. Each interview took around 30 to 40 minutes in duration. Study participants were assured that their information will remain confidential and no identifying features will be mentioned on the transcript. 

Data collection was ceased once saturation was achieved. The sample size was not predetermined, and
 an iterative approach of simultaneous data collection and analysis was taken to determine the point of
 data saturation. Data saturation refers to the point in the research process when no new information is
 discovered in data analysis and this redundancy signals to researchers that data collection may cease.<sup>13</sup>

## 49 17250 173 *Ethical considerations*

51 174 Ethical approval for this study was obtained from the Aga Khan University Ethical Review Committee
 52 175 (AKU-ERC) [2020-4825-10599].

53 176

## 54 177 Data analysis

Study data were analyzed manually using the conventional content analysis technique.<sup>14</sup> Firstly, the audio recordings from the interviews were transcribed and then translated into the English language. No identifying characteristics were included in the transcriptions. Transcripts were read several times by research investigators to develop an interpretation of the community perceptions, attitudes, practices regarding the Covid-19 pandemic. This involved an iterative process where data were coded, compared, 

contrasted, and refined to generate emergent themes. The transcribed text was divided into 'meaning units' which was later shortened and labeled with a 'code' without losing the study context. Codes were then analyzed and grouped into similar categories. In the final step, similar categories were assembled under sub-themes and main themes. 

#### 

#### **Patient and Public Involvement:**

Patient public involvement is a relatively new concept in Pakistan. Our data collection tool was piloted through two IDIs to ensure that it is inclusive and comprehensive. We will also engage them in disseminating findings of this study, particularly their contribution while developing research briefs in plain language and communicating them to community members will be very valuable. 

#### **Results**

In this gualitative study, 27 IDIs were conducted, between May and June 2020, with a variety of community members including, young adults, middle-aged adults, and older adults of both genders. The characteristics of study participants are presented in Table 2. Based on the data collection and thematic analysis, six overarching themes were identified (I) Community knowledge and perceptions around Covid-19; (II) Trusted and preferred sources of health information; (III) Initial thoughts and feeling towards Covid-19 pandemic; (IV) Community practices to prevent exposure from Covid-19; (V) Perceived risks associated with poor adherence to infection control practices; and, (VI) Future preparedness of community to avoid the second wave of outbreak. The themes are presented below with illustrative quotes. 

#### Table 2: Characteristics of IDI Study Participants (IDIs=27)

| Characteristics of IDI participants |               | N (%) or mean $\pm$ SD | Median (range) |
|-------------------------------------|---------------|------------------------|----------------|
| Gender                              | Female        | 14 (51.9%)             |                |
|                                     | Male          | 13 (48.1%)             |                |
| Age                                 |               | $39.62 \pm 13.94$      | 36 (21-64)     |
| Educational Level                   | Intermediate  | 5 (18.5%)              |                |
|                                     | Bachelors     | 13 (48.1%)             |                |
|                                     | Masters       | 9 (33.3%)              |                |
| Occupation                          | Homemaker     | 6 (22.2%)              |                |
|                                     | Students      | 2 (7.4%)               |                |
|                                     | Working       | 19 (70.4%)             |                |
|                                     | professionals |                        |                |

#### Themes

1. Community knowledge and perceptions around Covid-19

Mixed responses received for the question on community members' knowledge on Covid-19. Community members shared that initially they had no knowledge about Covid-19 but with time they were able to acquire fairly good knowledge about this virus in general and its signs and symptoms, since it was first identified in Wuhan, China. Highlighting this point, one respondent stated:

"I did not know much about it earlier but whatever right information is served on social media I am aware of it. I know things like what it is? how it is spreading out? and how to take care of my family? Though I am not getting much into the scientific part of it." (IDI-02, Female) 

Participants stated that they are updating their knowledge continuously through certificate courses, journal publications, news, social media, etc. 

"I believe I have fairly good knowledge of this virus as I have recently completed two online certificates on the Covid-19 pandemic." (IDI-17, Male)

| 1        |     |   |
|----------|-----|---|
| 2        |     |   |
| 3        | 224 |   |
| 4        | 225 | A few community members verbalized that initially, they were so curious to know about Covid-19 but          |
| 5        | 226 | now they have been avoiding reading about it because it causes a lot of anxiety and stress. Commenting      |
| 6        | 227 | on the negative consequences of too much information, one female community member stated:                   |
| 7        | 228 | "I am not curious to know more about this virus because the deluge of information can make me feel          |
| 8        | 229 | overwhelmed and cause anxiety and depression disorder. I am only following basic prevention tips to         |
| 9        | 230 | prevent my exposure to Covid-19." (IDI 11, Female.)   |
| 10       | 230 | prevent my exposure to Covia-13. (1D1 11, Femate.)  |
| 11       | 231 | 2 Trusted and proformed courses of health information   |
| 12       |     | 2. Trusted and preferred sources of health information  |
| 13       | 233 | When asked about their understanding on trusted sources of information, participants listed several         |
| 14       | 234 | trusted sources including, news channels, information from government authorities, webinar sessions         |
| 15       | 235 | by different hospitals, information from community-based groups, world health organization (WHO)            |
| 16       | 236 | website, updates from relatives and friends working in the medical field, electronic media, research        |
| 17       | 237 | journals, etc.  |
| 18       | 238 |   |
| 19       | 239 | "I think that there are many sources that provide reliable information about Covid-19. These include        |
| 20       | 240 | print media, social media, news channels (BBC/CNN), government authorities, webinar sessions by             |
| 21       | 241 | aga khan university hospital (AKUH), etc." (IDI-06, Female.)  |
| 22       | 242 |   |
| 23       | 243 | However, a few community members raised concerns about the authenticity of the information available        |
| 24       | 244 | at electronic and social media such as Facebook, WhatsApp, etc. This point was illustrated by a             |
| 25       | 245 | respondent who stated:  |
| 26       | 246 |   |
| 27       | 247 | "We are not relying much on the news channels because we think that the media does not present a            |
| 28       | 248 | true picture of the current situation. Sometimes, the news channels exaggerate the news so much and         |
| 29       | 249 | create negativity in our minds". (IDI-04, Female  |
| 30       | 250 |   |
| 31<br>32 | 251 | Some community members mentioned that they prefer to gain information from close friends and                |
| 33       | 252 | relatives who are working in hospitals and are directly involved in the care of Covid-19 patients. Others   |
| 33       | 253 | mentioned that their preferred information sources include social media (WhatsApp groups, Instagram),       |
| 35       | 254 | news channels, mainstream media, guidelines from community-based institutions and religious                 |
| 36       | 255 | institutions, AKUH sessions, and self- study research through WHO and CDC websites, etc.                    |
| 37       | 256 | institutions, Arcorr sessions, and sen-study research through who and ende websites, etc.                   |
| 38       | 257 | "I have an advantage because I have a person in my family who is from the medical field so I can get        |
| 39       | 258 | updated knowledge all times. Also, from the very beginning, I am following the WHO page, AKUH               |
| 40       | 258 | webinars, and news channels like BBC and CNN. I rarely refer to the local site because I think the          |
| 41       | 260 | information there is also not reliable." (IDI-07, Female  |
| 42       |     | information there is also not reliable. (1D1-07, Female   |
| 43       | 261 | Expressing similar apparent, a famala community member stated   |
| 44       | 262 | Expressing similar concerns, a female community member stated:  |
| 45       | 263 | "I would rather prefer to rely on information circulated by religious intuitions because that provides      |
| 46       | 264 | authentic, concise, and relevant evidence on Covid-19". (IDI-06, Female, 56 yrs.)                           |
| 47       | 265 | 2. In the later and facility terms $C_{1}$ (1.10) $L_{1}$   |
| 48       | 266 | 3. Initial thoughts and feeling towards Covid-19 pandemic   |
| 49       | 267 | The research participants described initial thoughts and feeling towards the Covid-19 pandemic. Most        |
| 50       | 268 | community members perceived a sense of shock and chaos in the initial days because all were quickly         |
| 51       | 269 | shutdown from schools, public places, markets to religious places. Further participants expressed the       |
| 52       | 270 | feeling of confusion, depression, and anxiety.  |
| 53       | 271 |   |
| 54       | 272 | "To be very honest, I was very petrified with this idea especially looking at the situation in china. I was |
| 55       | 273 | also supposed to travel but I canceled the tickets because I did not want to be stuck in another country.   |
| 56       | 274 | I was very much taking it into my head. Until now, I would not say I have become completely indifferent,    |
| 57       | 275 | but I am a little relaxed than before." (IDI-07, Female   |
| 58       | 276 |   |
| 59       |     |   |

| 2  |      |  |
| 3  | 277  | On the other hand, few participants mentioned that the initial days were fun as many of them got the         |
| 4  | 278  | opportunity to unwind themselves from busy routines, but after a couple of days, the change felt drastic,    |
| 5  | 279  | shocking, and difficult to contain.  |
| 6  |      | shocking, and difficult to contain.  |
| 7  | 280  |  |
| 8  | 281  | "Initially, it felt like any other disease outbreak like influenza, malaria, HIV honestly, I felt a sense    |
| 9  | 282  | of relief we were discussing in our family that it's good that we are getting enough time for fun and        |
| 10 | 283  | relaxation. But when the strict lockdown was announced, it was hard to face the reality of the Covid-        |
| 11 | 284  | 19 pandemic." (IDI-05, Female.)  |
| 12 | 285  |  |
| 13 | 286  | A few community members indicated that they were initially confused about the overall situation and          |
| 14 | 287  | was trying to figure out whether Covid-19 is a hype or a real danger. The participants verbalized that it    |
|    | 288  | took some time to internalize the new normal as it filtered down to them.                                    |
| 15 | 288  | took some time to internatize the new normal as it intered down to them.                                     |
| 16 |      |  |
| 17 | 290  | "Initially I felt like this is all fake and exaggerated. I told my son that people have created hype on it.  |
| 18 | 291  | But when religious institutions got closed for ensuring social distancing then I realized that this is       |
| 19 | 292  | something really dangerous." (IDI-22, Female   |
| 20 | 293  |  |
| 21 | 294  | 4. Community practices to prevent exposure from Covid-19   |
| 22 | 295  |  |
| 23 | 296  | Several preventive strategies mentioned by community members to prevent exposure to Covid-19.                |
| 24 | 297  | These include social distancing, staying at home, hand washing, use of alcohol-based hand rubs, steam        |
| 25 | 298  | inhalation, and frequent use of the antiseptic spray for disinfection purposes. Many community               |
| 26 | 299  | members mentioned that they make Dettol spray for disinfecting utensils, door handles, and other             |
| 27 |      |  |
| 28 | 300  | miscellaneous items that are purchased from markets on a routine basis. Also, participants verbalized        |
| 29 | 301  | that they wear masks and gloves if the plan to go outside for groceries or any other necessary task. On      |
| 30 | 302  | return, they wash their hands, take shower, and disinfect all their stuff to prevent exposure to infection.  |
| 31 | 303  |  |
| 32 | 304  | We are wearing masks and sanitizing all the time when we go out of the home. I usually avoid going           |
| 33 | 305  | out, but when I go, I plan my day in a way that I get done with most of the tasks. Just today, I went out    |
| 34 | 306  | for one hour to draw cash from the bank, and purchase groceries. (IDI-09, Male.)                             |
| 35 | 307  |  |
| 36 | 308  | A few community members stated that they have allocated separate rooms and utensils for family               |
| 37 | 309  | members who are working in a hospital setting.   |
| 38 | 310  | memoers who are working in a nospital setting.   |
| 39 |      | "My sister is a destant was used to share a new hefens but you in the time of Cavid 10 and have              |
| 40 | 311  | "My sister is a doctor we used to share a room before but now in the time of Covid-19 we have                |
|    | 312  | allocated separate room to her. When she gets back from the hospital, we disinfect her first using Dettol    |
| 41 | 313  | spray, and then she takes a shower. She wears a mask all the time when she is at home." (IDI-07,             |
| 42 | 314  | Female)  |
| 43 | 315  |  |
| 44 | 316  |  |
| 45 | 317  | 5. Perceived risks associated with poor adherence to infection control practices                             |
| 46 | 318  | Most respondents reported that there will be an increase in the number of Covid-19 cases as a result of      |
| 47 | 319  | poor adherence to infection control practices. In particular, community members notified that the            |
| 48 | 320  | younger generation may inflict damage in the community due to their poor adherence to precautionary          |
| 49 | 321  | measures.  |
| 50 |      | liicasules.  |
| 51 | 322  |  |
| 52 | 323  | If I stand in my balcony, I see that there are a lot of people socializing in the colony and are not wearing |
| 53 | 324  | a mask. The young generation is standing in groups and is interacting not maintaining social                 |
| 54 | 325  | distancing. They are going back to their homes and risking the lives of elders and children in their         |
| 55 | 326  | family. (IDI-09, Male)   |
| 56 | 327  |  |
| 57 | 328  | Besides, participants highlighted that during Eid festive, individuals were observed not to follow           |
| 58 | 329  | standard precautions which may result in huge losses. A few participants stated that each member of          |
| 59 | 330  | the community should ensure their social responsibility by wearing a mask, maintaining social                |
| 60 | 331  | distancing, and following other standard operating measures (SOPs) set by community leaders.                 |
|    | 33 I | and and the sum of the sum and operating measures (5015) set by community readers.                           |

> As Eid is coming, people are visiting markets for purchasing stuff as if nothing has changed. There is so much traffic in the shopping area... no SOPs are being followed. People are not playing their part when it comes to social responsibility. I presume that there will be so much damage to the communities ...if people would not follow safety precautions. (IDI-03, Female)

6. Future preparedness of community to avoid the second wave of the outbreak

When asked about community preparedness to prevent the second wave of outbreak, several
participants suggested that drills and training should be organized for communities to ensure better
preparedness.

I believe that as soon as this situation resolves... the community should focus on drills and training for
the second wave of Covid-19 or any other outbreak in the future. The drills and training can include
things like what mode of communication should the community prefer when staying at home? What
sources to rely on? etc. The drills should be performed on a routine basis as we do for earthquakes and
other natural disasters. (IDI-20, Male)

Also, members of the community recommended that the role of community nursing, basic health units, and community health centers should be recognized to adequately respond to the second wave of Covid-19. Alongside this, community members suggested that the government should ensure strict compliance to SOPs through regulatory reforms. Finally, members recommended that the community should do fundraising activity to ensure fund allocation for underserved individuals.

"There is a great role of community sciences because awareness about prevention can be created from that ground ... also fund-raising activities should be encouraged in communities to help poor people during the second wave of Covid-19." (IDI-15, Female)

## Discussion

To the best of our knowledge, this is the first study to explore community perceptions, attitudes, practices regarding the Covid-19 pandemic in Karachi, Pakistan. The study investigated initial thoughts and feelings of the community towards Covid-19, community knowledge around Covid-19, trusted sources of information and preferred communication channels, current community practices to prevent exposure, perceived risks associated with poor adherence to safety measures, and future preparedness of community to avoid second Covid-19 wave.

In general, study participants in our research had a fairly good level of knowledge about Covid-19, its spread, and prevention techniques. Our study participants acquired knowledge about disease via several sources including, certificate courses, journal publications, news, and social media. These findings are generally consistent with the results of the study conducted on Egyptian adults, in which participants gained a good general knowledge of the disease, its methods of spread, and prevention via several novel channels including, social media platforms.<sup>15</sup> Concurrently, a few members of the community showed reluctance to obtain new knowledge as it tends to generate anxiety and stress among them. The reluctance among community members was also apparent in a study conducted with the Indian population, where nearly half the participants felt panic after reading reports of Covid-19 pandemic on the electronic and print media over the past week.<sup>16</sup>

51 377 52 378

When we asked participants about trusted and preferred sources of information to learn about Covid-19, participants listed several trusted sources including electronic media, print media, mainstream media, social media, etc. Another interesting and unique finding is that participants preferred receiving information from religious institutions and relatives and friends working in hospital facilities. Participants also indicated that although these sources provide a simple and accessible way of being informed, they can also be a cause of misinformation. Abdelhafiz et al. study reported one such example of misinformation, where Facebook disseminated fake news about the drug, hydroxychloroquine, and its potential to treat Covid-19 patients. This fake information encouraged a lot of individuals to keep

### **BMJ** Open

- stock of this drug, leading to a shortage of this medicine. <sup>15</sup> Thus, these sources of information should be used with caution, to avoid the spread of fabricated data, rumors and unauthentic information.<sup>15</sup>
- In our study, most participants perceived a sense of shock and chaos in the initial days of the pandemic because of the lockdown and closure of all routine activities. Participants expressed a feeling of confusion, depression, and anxiety as a result of unexpected turmoil. Similar thoughts and emotions have been reported by many others in Covid-19 studies conducted in China, where participants perceived Covid-19 as life-threatening danger.<sup>17,18</sup> Alternatively, few participants enjoyed the initial lockdown days as it provided them an opportunity to reset their lives. Interestingly, a few community members believed that media has created artificial hype or hysteria around the new virus for some potential gain. This finding is interesting as it reflects the growing awareness of the community regarding Covid-19 and highlights the cons of using social media platforms as a trusted source of information. The outbreak of Swine flu also linked the virus with media hype.<sup>19</sup> The Covid-19 pandemic has already seen a rise in conspiracy theories, fake news, and misinformation. Therefore, it is hard for communities to distinguish scientific evidence and facts from less reliable sources of information.<sup>20</sup> The Nature Medicine article clarified that the virus is not purposefully manipulated or created in laboratories.<sup>21</sup> Our study found that participants needed adequate time to internalize the new normal as it filtered down to them. Thus, a systemic resilience approach is essential to deal with a sense of shock and drastic change associated with Covid-19 pandemic.<sup>12</sup>
- Our results undoubtedly show that participants have a positive general attitude towards safety measures to prevent the transmission of the Covid-19 virus. Participants believed in the value of maintaining social distancing, staying at home, cleaning hand with soap water or alcohol-based sanitizer, wearing a facemask, and using Dettol disinfectant spray. It has also been seen in another Covid-19 study that community members are adhering to safety precautions to avoid virus transmission. This indicates positive behavior and attitude of the community towards Covid-19, as a result of better community sensitization.<sup>16</sup> A unique yet encouraging finding reported by our study was that the community members allocated separate rooms and utensils for family members who are working in a hospital setting. This indicates that most participants in our study had adequate awareness of safety measures for preventing exposure to Covid-19.
- Commenting on the perceived risk associated with the Covid-19 outbreak, the majority of the participants in this study expressed a high level of susceptibility in contracting Covid-19 as a result of poor adherence to safety measures by some community members. Our study participants notified that the younger generation may inflict damage in the community as safety precautions are not being followed. This finding indicates that community mobilization and sensitization activities are still weak and require concentrated efforts to raise awareness and resolve misconceptions that are associated with an increase in Covid-19 cases. In such circumstances, it is recommended that community leadership should set rules and regulations to help individuals avoid behaviors that are no longer considered socially responsible.<sup>20</sup>
- Finally, community members recommended ongoing training and drills to prevent the second wave of the Covid-19 outbreak. A viewpoint by Dzigbede et al reported that local governments should implement disaster training exercises to prepare for the second wave of Covid-19.<sup>22</sup> Such training have a potential to strengthen local response and recovery from the Covid-19 Pandemic.<sup>22</sup> One encouraging finding of the study was that the members of community recognized that the role of community nursing, and community health centers to prepare for the second wave of Covid-19. This has also been emphasized by Bavel et al in a perspective paper. Since the Covid-19 crisis requires large-scale behavior change, the role of community health sciences and social and behavioral sciences is of utmost value to help align human behaviors with the recommendations of epidemiologists and public health experts.<sup>20</sup>
- This study provides an initial evidence base of communities' perceptions, and attitudes towards Covid-19 in an early stage of the pandemic when the communities just start to learn about the Covid-19 virus. One of the limitations of this study was that all study respondents were interviewed online, to minimize the risk of infection. In online interviews, the authors did not have the opportunity to build rapport with

community members over Zoom or obtain non-verbal cues during interviews. Secondly, due to the nature of outbreak prevention, the study was unable to conduct focus group discussions with community members, which would have provided detailed information about personal and group feelings. Besides, the timings of interviews (May-June 2020) is also one of the limitations of this study as the results would have yielded a different picture if participants would have been interviewed in Feb and March 2020, when the pandemic just occurred in Pakistan. Lastly, this was a short-term study and does not involve long-term perceptions of the community members with this pandemic. 

The findings from this study will help tailor existing public health interventions to address the social and behavioral problems related to this pandemic. Future research should be directed at developing and implementing contextual interventions to improve community understanding and social responses towards Covid-19. 

#### Conclusion

This study provides an in-depth view of communities' perspectives and attitudes towards the Covid-19 pandemic. Generally, community members had good knowledge about Covid-19, and positive behavior and attitude towards using standard precautions, which is important to prevent exposure to Covid-19. The knowledge is mainly acquired through electronic media, print media, and social media platforms, which has pros and cons. However, some community members including younger individuals had poor adherence to safety measures. This may necessitate concentrated efforts to raise awareness and resolve misconceptions through community mobilization and sensitization activities. The study emphasizes that sufficient knowledge and awareness about Covid-19, adequate training and drills, and adherence to safety measures, are necessary to better prepare for the second wave of Covid-19. Lessons learned from this study are extremely valuable and can be transferable to community settings in Pakistan that have similar socio-demographic characteristics. However, findings cannot be extrapolated to other countries because of the differences in participant demographics and health system constraints.

## Annex-1 In-Depth Interview Guide for interviewing community members

## Basic Information

| S.no | Participant<br>Code<br>(Confidential) | Age | Sex | Occupation | Educational<br>level | Locality/site |
|------|---------------------------------------|-----|-----|------------|----------------------|---------------|
|      |                                       |     |     |            |                      |               |
|      |                                       |     |     |            |                      |               |
|      |                                       |     |     |            |                      |               |
|      |                                       |     |     |            |                      |               |
|      |                                       |     | R   |            |                      |               |

## General Perceptions and attitudes towards COVID-19

- 1. How do you feel about your knowledge level regarding COVID-19 pandemic?
- 2. How did you learn about the coronavirus outbreak?
- 3. What is the reliable source of information about COVID-19?

Probes: social media, television, newspapers/magazines, websites, friends/family, health care professionals

- 4. What were your initial reactions towards COVID-19, when you first heard about it?
  - a. Probes: curse from God etc.
- 5. What are your thoughts and feelings about COVID-19 cases?

## Perceptions on safety measures for preventing COVID-19

 What safety measures have you taken for yourself and for your family safety in COVID-19?

**Probes**: hand washing, sanitizer, social distancing, covering your cough, avoiding touching your eyes, nose, and mouth with unwashed hands, wearing a face mask, avoiding close contact with someone who is sick

## Perceived risks associated with poor adherence to safety measures

- 1. Do you think novel coronavirus will inflict serious damage in your community, if adequate safety measures are not taken?
- 2. Do you think you can protect yourself against the novel coronavirus?

## **Future Preparedness**

1. In your opinion, what are the needs for future preparedness for any outbreak that prepare community (trainings, awareness, equipment, protective gears)

one teries only

## Standards for Reporting Qualitative Research (SRQR)\*

http://www.equator-network.org/reporting-guidelines/srqr/

Page/line no(s).

## Title and abstract

| Title - Concise description of the nature and topic of the study Identifying t | :he                    |
|--|------------------------|
| study as qualitative or indicating the approach (e.g., ethnography, grounde    | ed Pape no. 1/line     |
| theory) or data collection methods (e.g., interview, focus group) is recomm    | nended no. 1-2         |
| Abstract - Summary of key elements of the study using the abstract forma       | t of the               |
| intended publication; typically includes background, purpose, methods, res     | sults, Pape no. 2/line |
| and conclusions  | no. 32-58              |

## Introduction

| troduction   |                                |
|--|--------------------------------|
| <b>Problem formulation</b> - Description and significance of the problem/phenomenon studied; review of relevant theory and empirical work; problem statement | Pape no. 4/line<br>no. 124-127 |
| <b>Purpose or research question</b> - Purpose of the study and specific objectives or questions  | Pape no. 4/line<br>no. 116-120 |

#### Methods Г

| Qualitative approach and research paradigm - Qualitative approach (e.g.,                  |                |
|---|----------------|
| ethnography, grounded theory, case study, phenomenology, narrative research)              |                |
| and guiding theory if appropriate; identifying the research paradigm (e.g.,               | Pape no. 4/li  |
| postpositivist, constructivist/ interpretivist) is also recommended; rationale**          | no. 125-127    |
|   | 110. 125-127   |
|   |                |
| <b>Researcher characteristics and reflexivity</b> - Researchers' characteristics that may |                |
| influence the research, including personal attributes, qualifications/experience,         |                |
| relationship with participants, assumptions, and/or presuppositions; potential or         |                |
| actual interaction between researchers' characteristics and the research                  | Pape no. 6/li  |
| questions, approach, methods, results, and/or transferability                             | no. 206-210    |
|   | Pape no. 4 &   |
|   | 5/line no. 129 |
| Context - Setting/site and salient contextual factors; rationale**                        | 142            |
| Sampling strategy - How and why research participants, documents, or events               |                |
| were selected; criteria for deciding when no further sampling was necessary (e.g.,        | Pape no. 4/li  |
|   | no. 125        |
| sampling saturation); rationale**   | 110. 125       |
| Ethical issues pertaining to human subjects - Documentation of approval by an             |                |
| appropriate ethics review board and participant consent, or explanation for lack          | Pape no. 6/li  |
| thereof; other confidentiality and data security issues                                   | no. 191-193    |
| Data collection methods - Types of data collected; details of data collection             |                |
| procedures including (as appropriate) start and stop dates of data collection and         | Pape no. 5-    |
| analysis, iterative process, triangulation of sources/methods, and modification of        | 6/line no. 144 |
| procedures in response to evolving study findings; rationale**                            | 189            |
|   | 105            |

| <b>Data collection instruments and technologies</b> - Description of instruments (e.g., interview guides, questionnaires) and devices (e.g., audio recorders) used for data collection; if/how the instrument(s) changed over the course of the study | Pape no. 6 & 6/line no. 159-<br>189   |
|---|---------------------------------------|
| <b>Units of study</b> - Number and relevant characteristics of participants, documents, or events included in the study; level of participation (could be reported in results)  | Pape no. 6-<br>7/line no. 224-<br>225 |
| <b>Data processing</b> - Methods for processing data prior to and during analysis, including transcription, data entry, data management and security, verification of data integrity, data coding, and anonymization/de-identification of excerpts    | Pape no. 6/lir<br>no. 195-204         |
| <b>Data analysis</b> - Process by which inferences, themes, etc., were identified and developed, including the researchers involved in data analysis; usually references a specific paradigm or approach; rationale**                                 | Pape no. 6/lir<br>no. 195-204         |
| <b>Techniques to enhance trustworthiness</b> - Techniques to enhance trustworthiness and credibility of data analysis (e.g., member checking, audit trail, triangulation); rationale**  | Pape no. 6/lin<br>no. 206-210         |

## **Results/findings**

| <b>Synthesis and interpretation</b> - Main findings (e.g., interpretations, inferences, and themes); might include development of a theory or model, or integration with prior research or theory | Pape no. 6-<br>9/line no. 213-<br>376 |
|---|---------------------------------------|
| Links to empirical data - Evidence (e.g., quotes, field notes, text excerpts, photographs) to substantiate analytic findings  | Pape no. 6-<br>9/line no. 213-<br>376 |
| ussion  |                                       |

## Discussion

| Integration with prior work, implications, transferability, and contribution(s) to<br>the field - Short summary of main findings; explanation of how findings and |                  |
|---|------------------|
|   |                  |
|   |                  |
| conclusions connect to, support, elaborate on, or challenge conclusions of earlier  | Pape no. 9-      |
| scholarship; discussion of scope of application/generalizability; identification of   | 11/line no. 381- |
| unique contribution(s) to scholarship in a discipline or field  | 487              |
|   | Pape no. 11/lin  |
| Limitations - Trustworthiness and limitations of findings   | no. 463-479      |

Other

| <b>Conflicts of interest</b> - Potential sources of influence or perceived influence on study conduct and conclusions; how these were managed | Pape no. 13/line<br>no. 527-528     |
|---|-------------------------------------|
| <b>Funding</b> - Sources of funding and other support; role of funders in data collection, interpretation, and reporting                      | Pape no.<br>13/line no. 530-<br>531 |

\*The authors created the SRQR by searching the literature to identify guidelines, reporting standards, and critical appraisal criteria for qualitative research; reviewing the reference lists of retrieved sources; and contacting experts to gain feedback. The SRQR aims to improve the transparency of all aspects of qualitative research by providing clear standards for reporting qualitative research.

\*\*The rationale should briefly discuss the justification for choosing that theory, approach, method, or technique rather than other options available, the assumptions and limitations implicit in those choices, and how those choices influence study conclusions and transferability. As appropriate, the rationale for several items might be discussed together.

## 3 31 Abstract

Background: The Government of Pakistan is facing difficulty to contain the surge of COVID-19 due to the country's social, political, economic, and cultural context. Experiences from the previous epidemic suggest that community perceptions, social norms, and cultural practices can impede COVID-19 containment. To understand social responses towards COVID-19, the study aims to explore the understanding of COVID-19 and the acceptance of control measures among community members.

Methods: We conducted an exploratory qualitative study using a purposive sampling approach, at two
 Sommunities of Karachi, Pakistan. In-depth interviews were conducted with community members
 including, young, middle-aged, and older adults of both genders. Study data were analyzed manually
 using the conventional content analysis technique.

Results: A total of 27 in-depth virtual interviews were conducted, between May and June 2020. Six overarching themes were identified: (I) Community knowledge and perceptions around COVID-19; (II) Trusted and preferred sources of health information; (III) Initial thoughts and feeling towards COVID-19 pandemic; (IV) Community practices to prevent exposure from COVID-19; (V) Perceived risks associated with poor adherence to infection control practices; and (VI) Future preparedness of community to avoid the second wave of the outbreak. Generally, community members had good knowledge about COVID-19, and positive behavior and attitude towards using standard precautions. The knowledge is mainly acquired through electronic, print, and social media platforms, which have pros and cons. However, some community members including younger individuals had poor adherence to safety measures. This may necessitate concentrated efforts to raise awareness through community mobilization and sensitization activities. 

Conclusion: This study provides an initial evidence base of communities' perceptions, and attitudes
towards COVID-19 in an early stage of pandemic. The study emphasizes that sufficient knowledge and
awareness about COVID-19, adequate training and drills, and adherence to safety measures, are
necessary to better prepare for the second wave of COVID-19.

Keywords: COVID-19, community perceptions, public health, exploratory qualitative study, Pakistan

## 64 Strengths and limitations of this study

- This study provides an initial evidence base of communities' perceptions, and attitudes towards COVID-19 in an early stage of the pandemic when the communities just start to learn about the COVID-19 virus.
  - The use of conventional content analysis helped understand in-depth views of communities' perspectives and attitudes towards the COVID-19 pandemic.
  - The study invited participants from two communities of Karachi; therefore, our data might have missed views, from other major ethnic and cultural groups.
- One limitation is that to minimize the risk of infection all study respondents were interviewed online over Zoom and hence the authors did not have the opportunity to build rapport with the respondents or obtain non-verbal cues during interviews.

#### Background

By June 29, 2020, the failure to control the COVID-19 outbreak had resulted in 182,277,425COVID-19 cases and 3,947,643deaths worldwide.1 As of July 29, 2021, Pakistan has recorded more than 956,392 COVID-19 cases with 22,254deaths.2 On February 26, 2020, the first case of COVID-19 was reported from Karachi.3 The cases increased exponentially since the lockdown was lifted in late May and June, 2020.4 The uptick in cases was perhaps due to the Eid festival which happened in late May 2020. Many awareness campaigns were initiated for the general population by both local and federal governments in Pakistan to spread awareness about the risks, signs, and symptoms of COVID-19. One of the campaigns involved spreading awareness to the masses through text messages, which were sent by the government of Pakistan on all mobile networks. In addition, recorded voice messages in various local languages including Urdu, Pashto, and Sindhi, were used as caller tunes before every phone call to warn against the risks of COVID-19, its spread, and complications to help control the Covid-19 spread<sup>5</sup>. 

The Government of Pakistan has been facing difficulty to contain the surge of COVID-19 due to the country's social, political, economic, and cultural context. The increased resistance by communities and local and religious leaders has made it even more challenging to slow down the spread of COVID-19.6 There have been many generalized and subjective explanations of community interactions with COVID-19 and its control activities. In Pakistan, the initial response of the communities to the rising threat of COVID-19 was that of a generally reported apathy and indifference.<sup>7</sup> Despite several public health messages by Health Ministry<sup>8</sup>, communities are not adhering to the infection control precautions which are regularly reinforced through mainstream media. The non-cooperative attitude displayed by the public has further fueled the rapid transmission of the disease across the country.<sup>9</sup> Community practices, and attitudes towards COVID-19 have been described as barriers to an effective response.<sup>10</sup> Experiences from the previous epidemic suggest that community perceptions, social norms, and cultural practices can impede the containment of COVID-19.11 The fight against Ebola in Africa was subjected to similar challenges.<sup>12</sup> 

A large body of evidence supports the value of qualitative methods in epidemic and pandemic research. Leading global health agencies like the World Health Organization (WHO) and the Centers for Disease Control and Prevention (CDC) recommend using qualitative methods in epidemiologic investigations to capture social responses to the pandemic.<sup>13</sup> So far various quantitative studies have been conducted on COVID-19 to study the epidemiology of the disease. However, these studies are not well suited to capture the social implications of disease including the reasons for individuals' behavior, the social connections, or the ways families make sense of what is happening around them. Qualitative lessons from recent epidemics like SARS, H1N1, and EVD<sup>11</sup> highlight how to engage with the social, cultural, and political facets of the epidemic to build effective interventions.<sup>13</sup> 

To understand social responses towards COVID-19, it is important to explore the understanding of COVID-19 and the acceptance of control measures among the community. Given the significance of qualitative inquiry, the current situation in Karachi, Pakistan demands an exploration of community perceptions, attitudes, practices regarding the COVID-19 pandemic. The open-ended nature of the study will help focus on how individuals and communities perceive COVID-19 disease. 

#### **Methods**

#### Study design and setting

This study utilized an exploratory qualitative research design using a purposive sampling approach. The study was conducted in two Muslim communities of Karachi city. These include Karimabad Federal B Area Block 3 Gulberg Town, and Garden East and Garden West area of Karachi city. 

Karimabad is a neighborhood in the Karachi Central district of Karachi, Pakistan. It is situated in the south of Gulberg Town bordering Liaquatabad, Gharibabad, and Federal B. Area. The population of this neighborhood is predominantly Ismailis. People living here belong mostly to the middle class to the lower middle class. It is also known for its wholesale market for sports goods and stationery.

Garden is an upmarket neighborhood, which is in the Karachi South district of Karachi, Pakistan. It is subdivided into two neighborhoods: Garden East and Garden West. It is the residential area around the Karachi Zoological Gardens, hence it is popularly known as the 'Garden' area. The population of Garden used to be primarily Ismaili and Goan Catholic but has seen increasing numbers of Memons, Pashtuns, and Baloch. These areas have been selected purposively to interview members of these communities. 

- This design did not intend to look at the differences between the two neighborhoods with regard to perceptions and attitudes towards COVID-19 but rather to understand how community members in Karachi, Pakistan perceive COVID-19 disease and its precautionary measures.

#### Data collection methods and study participants

The data collection methods included in-depth interviews (IDIs) with community members. The IDIs aimed to explore community perceptions, attitudes, practices regarding the COVID-19 pandemic in Karachi, Pakistan. Adult community members of different ages and both genders who have not contracted the COVID-19 disease were purposively recruited from both sites, as mentioned in below table 1.

Table 1 Study participants for IDIs 

| In-depth interview Participants  | Total IDIs= 27 | Male=13; Female=14 |
|----------------------------------|----------------|--------------------|
| Young adults (18 -35 years)      | 12             | Male=6; Female=6   |
| Middle-aged adults (36-55 years) | 8              | Male=4; Female=4   |
| Older adults (> 55 years)        | 7              | Male=3; Female=4   |

Since this study aimed to explore general community perceptions, attitudes, practices regarding the COVID-19 pandemic, participants were excluded if they or their family members have been tested positive for COVID-19 or have been isolated/quarantined because of recent exposure. Because COVID-19 survivors and their family members might have different perceptions compared to the general community. 

#### Data collection procedure

A semi-structured interview guide was developed for conducting IDIs (Additional File 1). The interview guide included questions on socio-demographic characteristics, community knowledge, perceptions, and attitudes towards COVID-19, community practices to prevent exposure from COVID-19, perceived risks associated with poor adherence to safety measures, and perceptions on future preparedness for the second wave of COVID-19. The interview guides were pilot tested with a non-study sample (2 IDIs) with the same characteristics as the study sample. The pilot testing offered evidence-based guidance to improve data collection guides. 

The IDI participants were identified and contacted via the pre-existing community WhatsApp and email groups. The researchers obtained access to these groups through community leaders of both neighborhoods. The community leaders, gatekeepers in this study, supported the identification of a purposive sample through both communities. A total of 35 eligible individuals were contacted through these groups, out of which 27 agreed to participate in the study. Interviews were scheduled for participants' convenient day and time. Before beginning the interview, the study investigators explained the study objectives and procedures to eligible community members and obtained informed consent for their participation in the study. Informed consent was also obtained on either email or WhatsApp, for notetaking and audio recording of the interviews. Participants who were unable to write their names were asked to provide a thumbprint on the consent form to symbolize their consent to participate. Trained researchers, experienced in qualitative research, conducted online interviews via Zoom or Skype. At the start of the interview, each participant was asked to provide socio-demographic details including age, gender, educational level, and occupation. The interviews were conducted in the languages of English and/or Urdu. Each interview took around 30 to 40 minutes in duration. Study 

participants were assured that their information will remain confidential, and no identifying features will be mentioned on the transcript. 

Data collection was ceased once saturation was achieved; saturation refers to the point in the research process when no new information is discovered in data analysis<sup>14</sup>. The sample size was not predetermined, and an iterative approach of simultaneous data collection and analysis was taken to determine the point of data saturation. Data saturation refers to the point in the research process when no new information is discovered in data analysis and this redundancy signals to researchers that data collection may cease.<sup>15</sup> 

#### Ethical considerations

Ethical approval for this study was obtained from the Aga Khan University Ethical Review Committee (AKU-ERC) [2020-4825-10599]. 

#### Data analysis

Study data were analyzed manually using the conventional content analysis technique. <sup>16</sup> Firstly, the audio recordings from the interviews were transcribed and then translated into the English language. No identifying characteristics were included in the transcriptions. Transcripts were read several times by research investigators to develop an interpretation of the community perceptions, attitudes, practices regarding the COVID-19 pandemic. This involved an iterative process where data were coded, compared, contrasted, and refined to generate emergent themes by two independent investigators. The transcribed text was divided into 'meaning units' which were later shortened and labeled with a 'code' without losing the study context. Codes were then analyzed and grouped into similar categories. In the final step, similar categories were assembled under sub-themes and main themes. 

#### **Patient and Public Involvement:**

Patient public involvement is a relatively new concept in Pakistan. Our data collection tool was piloted through two IDIs to ensure that it is inclusive and comprehensive. We will also engage them in disseminating the findings of this study, particularly their contribution while developing research briefs in plain language and communicating them to community members will be very valuable. 

#### Results

In this gualitative study, 27 IDIs were conducted, between May and June 2020, with a variety of community members including, young adults, middle-aged adults, and older adults of both genders. The characteristics of study participants are presented in Table 2. None of the study participants belonged to the same family. All study participants were Muslim belonged to low-middle class families. Based on the data collection and conventional content analysis, six overarching themes were identified (I) Community knowledge and perceptions around COVID-19; (II) Trusted and preferred sources of health information; (III) Initial thoughts and feeling towards COVID-19 pandemic; (IV) Community practices to prevent exposure from COVID-19; (V) Perceived risks associated with poor adherence to infection control practices; and (VI) Future preparedness of community to avoid the second wave of outbreak. The themes are presented below with illustrative quotes. 

> Characteristics of IDI N (%) or mean  $\pm$  SD Median (range) participants Gender Female 14 (51.9%) Male 13 (48.1%)  $39.62 \pm 13.94$ 36 (21-64) Age Educational Level Intermediate 5 (18.5%) Bachelors 13 (48.1%) Masters 9 (33.3%) Occupation Homemaker 6 (22.2%) Students 2 (7.4%)

|----------|------------|---|--|--|
| 3        | 277        | "I have an advantage because I have a person in my family who is from the medical field so I can get        |  |  |
| 4        | 278        | updated knowledge at all times. Also, from the very beginning, I am following the WHO page, AKUH            |  |  |
| 5        | 279        | webinars, and news channels like BBC and CNN. I rarely refer to the local site because I think the          |  |  |
| 6        | 280        | information there is also not reliable." (IDI-07, Female)   |  |  |
| 7        | 281        |   |  |  |
| 8        | 282        | Expressing similar concerns, a female community member stated:  |  |  |
| 9<br>10  | 283        | "I would rather prefer to rely on information circulated by religious institutions because that provides    |  |  |
| 10<br>11 | 284        | authentic, concise, and relevant evidence on COVID-19". (IDI-06, Female)                                    |  |  |
| 12       | 285        |   |  |  |
| 13       | 286        | 3. Initial thoughts and feelings towards COVID-19 pandemic  |  |  |
| 14       | 287        | The research participants described initial thoughts and feeling towards the COVID-19 pandemic. Most        |  |  |
| 15       | 288        | community members perceived a sense of shock and chaos in the initial days because all were quickly         |  |  |
| 16       | 289        | shut down from schools, public places, markets to religious places. Further participants expressed the      |  |  |
| 17       | 290        | feeling of confusion, depression, and anxiety.  |  |  |
| 18       | 291        |   |  |  |
| 19       | 292        | "To be very honest, I was very petrified with this idea especially looking at the situation in china. I was |  |  |
| 20       | 293        | also supposed to travel but I canceled the tickets because I did not want to be stuck in another country.   |  |  |
| 21       | 294        | I was very much taking it into my head. Until now, I would not say I have become completely indifferent,    |  |  |
| 22       | 295        | but I am a little relaxed than before." (IDI-07, Female)  |  |  |
| 23       | 296        |   |  |  |
| 24       | 297        | On the other hand, few participants mentioned that the initial days were fun as many of them got the        |  |  |
| 25       | 298        | opportunity to unwind themselves from busy routines, but after a couple of days, the change felt drastic,   |  |  |
| 26       | 299        | shocking, and difficult to contain.   |  |  |
| 27<br>28 | 300        |   |  |  |
| 28<br>29 | 301        | "Initially, it felt like any other disease outbreak like influenza, malaria, HIV honestly, I felt a sense   |  |  |
| 30       | 302        | of relief we were discussing in our family that it's good that we are getting enough time for fun and       |  |  |
| 31       | 303        | relaxation. But when the strict lockdown was announced, it was hard to face the reality of the COVID-19     |  |  |
| 32       | 304        | pandemic." (IDI-05, Female)   |  |  |
| 33       | 305        |   |  |  |
| 34       | 306        | A few community members indicated that they were initially confused about the overall situation and         |  |  |
| 35       | 307        | were trying to figure out whether COVID-19 is a hype or a real danger. The participants verbalized that     |  |  |
| 36       | 308        | it took some time to internalize the new normal as it filtered down to them.                                |  |  |
| 37       | 309        |   |  |  |
| 38       | 310        | "Initially I felt like this is all fake and exaggerated. I told my son that people have created hype on it. |  |  |
| 39       | 311        | But when religious institutions got closed for ensuring social distancing then I realized that this is      |  |  |
| 40       | 312        | something really dangerous." (IDI-22, Female)   |  |  |
| 41       | 313        |   |  |  |
| 42<br>43 | 314        | 4. Community practices to prevent exposure from COVID-19  |  |  |
| 43       | 315        |   |  |  |
| 45       | 316        | Several preventive strategies were mentioned by community members to prevent exposure to COVID-             |  |  |
| 46       | 317        | 19. These include social distancing, staying at home, hand washing, use of alcohol-based hand rubs,         |  |  |
| 47       | 318        | steam inhalation, and frequent use of the antiseptic spray for disinfection purposes. Many community        |  |  |
| 48       | 319        | members mentioned that they make Dettol spray for disinfecting utensils, door handles, and other            |  |  |
| 49       | 320        | miscellaneous items that are purchased from markets on a routine basis. Also, participants verbalized       |  |  |
| 50       | 321        | that they wear masks and gloves if they plan to go outside for groceries or any other necessary task. On    |  |  |
| 51       | 322        | return, they wash their hands, take shower, and disinfect all their stuff to prevent exposure to infection. |  |  |
| 52       | 323        |   |  |  |
| 53       | 324        | We are wearing masks and sanitizing all the time when we go out of the home. I usually avoid going          |  |  |
| 54       | 325        | out, but when I go, I plan my day in a way that I get done with most of the tasks. Just today, I went out   |  |  |
| 55       | 326        | for one hour to draw cash from the bank, and purchase groceries. (IDI-09, Male)                             |  |  |
| 56       | 327        | A four community members stated that they have allocated commute means and extending to the 'l              |  |  |
| 57<br>58 | 328        | A few community members stated that they have allocated separate rooms and utensils for family              |  |  |
| 58<br>59 | 329<br>330 | members who are working in a hospital setting.  |  |  |
| 60       | 530        |   |  |  |
|          |            |   |  |  |

"My sister is a doctor... we used to share a room before but now in the time of COVID-19 we have allocated a separate room to her. When she gets back from the hospital, we disinfect her first using Dettol spray, and then she takes a shower. She wears a mask all the time when she is at home." (IDI-07. Female) 5. Perceived risks associated with poor adherence to infection control practices Most respondents reported that there will be an increase in the number of COVID-19 cases as a result of poor adherence to infection control practices. In particular, community members notified that the younger generation may inflict damage in the community due to their poor adherence to precautionary measures. If I stand in my balcony, I see that there are a lot of people socializing in the colony and are not wearing a mask. The young generation is standing in groups and is interacting ... not maintaining social distancing. They are going back to their homes and risking the lives of elders and children in their families. (IDI-09, Male) Besides, participants highlighted that during the Eid festival, individuals were observed not to follow standard precautions which may result in huge losses. A few participants stated that each member of the community should ensure their social responsibility by wearing a mask, maintaining social distancing, and following other standard operating measures (SOPs) set by community leaders. As Eid is coming, people are visiting markets for purchasing stuff as if nothing has changed. There is so much traffic in the shopping area... no SOPs are being followed. People are not playing their part when it comes to social responsibility. I presume that there will be so much damage to the communities ... if people would not follow safety precautions. (IDI-03, Female) 6. Future preparedness of community to avoid the second wave of the outbreak When asked about community preparedness to prevent the second wave of outbreak, several participants suggested that drills and training should be organized for communities to ensure better preparedness. I believe that as soon as this situation resolves... the community should focus on drills and training for the second wave of COVID-19 or any other outbreak in the future. The drills and training can include things like what mode of communication should the community prefer when staying at home? What sources to rely on? etc. The drills should be performed on a routine basis as we do for earthquakes and other natural disasters. (IDI-20, Male) Also, members of the community recommended that the role of community nursing, basic health units, and community health centers should be recognized to adequately respond to the second wave of COVID-19. Alongside this, community members suggested that the government should ensure strict compliance to SOPs through regulatory reforms. Finally, members recommended that the community should do fundraising activities to ensure fund allocation for underserved individuals. "There is a great role of community sciences because awareness about prevention can be created from that ground ... also fund-raising activities should be encouraged in communities to help poor people during the second wave of COVID-19." (IDI-15, Female) Discussion To the best of our knowledge, this is the first study to explore community perceptions, attitudes, practices regarding the COVID-19 pandemic in Karachi, Pakistan. The study investigated initial 

thoughts and feelings of the community towards COVID-19, community knowledge around COVID trusted sources of information and preferred communication channels, current community practices

to prevent exposure, perceived risks associated with poor adherence to safety measures, and future preparedness of the community to avoid second COVID-19 wave. 

In general, study participants in our research had a fairly good level of knowledge about COVID-19, its spread, and prevention techniques. Our study participants acquired knowledge about disease via several sources including, certificate courses, journal publications, news, and social media. These findings are generally consistent with the results of the study conducted on Egyptian adults, in which participants gained a good general knowledge of the disease, its methods of spread, and prevention via several novel channels including, social media platforms.<sup>17</sup> Concurrently, a few members of the community showed reluctance to obtain new knowledge as it tends to generate anxiety and stress among them. The reluctance among community members was also apparent in a study conducted with the Indian population, where nearly half the participants felt panic after reading reports of the COVID-19 pandemic on the electronic and print media over the past week.<sup>18</sup> 

When we asked participants about trusted and preferred sources of information to learn about COVID-19, participants listed several trusted sources including electronic media, print media, mainstream media, social media, etc. The preferred sources of information also indicated internet literacy in the community members, to some extent. Another interesting and unique finding is that participants preferred receiving information from religious institutions and relatives and friends working in hospital facilities. Participants also indicated that although these sources provide a simple and accessible way of being informed, they can also be a cause of misinformation. Abdelhafiz et al. study reported one such example of misinformation, where Facebook disseminated fake news about the drug, hydroxychloroquine, and its potential to treat COVID-19 patients. This fake information encouraged a lot of individuals to keep stock of this drug, leading to a shortage of this medicine. 17 Thus, these sources of information should be used with caution, to avoid the spread of fabricated data, rumors, and unauthentic information.17 Future research is needed to study the impact of the misinformation that is received from religious institutions, relatives, and friends working in hospital facilities. 

In our study, most participants perceived a sense of shock and chaos in the initial days of the pandemic because of the lockdown and closure of all routine activities. Participants expressed a feeling of confusion, depression, and anxiety as a result of unexpected turmoil. Similar thoughts and emotions have been reported by many others in COVID-19 studies conducted in China, where participants perceived COVID-19 as a life-threatening danger.<sup>19,20</sup> Alternatively, few participants enjoyed the initial lockdown days as it provided them an opportunity to reset their lives. Interestingly, a few community members believed that media has created artificial hype or hysteria around the new virus for some potential gain. This finding is interesting as it reflects the growing awareness of the community regarding COVID-19 and highlights the cons of using social media platforms as a trusted source of information. The outbreak of the Swine flu also linked the virus with media hype.<sup>21</sup> The COVID-19 pandemic has already seen a rise in conspiracy theories, fake news, and misinformation. Therefore, it is hard for communities to distinguish scientific evidence and facts from less reliable sources of information.<sup>22</sup> The Nature Medicine article clarified that the virus is not purposefully manipulated or created in laboratories.<sup>23</sup> Our study found that participants needed adequate time to internalize the new normal as it filtered down to them. Thus, a systemic resilience approach is essential to deal with a sense of shock and drastic change associated with the COVID-19 pandemic.<sup>22</sup> 

Our results undoubtedly show that participants have a positive general attitude towards safety measures to prevent the transmission of the COVID-19 virus. Participants believed in the value of maintaining social distancing, staying at home, cleaning hands with soap water or alcohol-based sanitizer, wearing a facemask, and using Dettol disinfectant spray. It has also been seen in another COVID-19 study that community members are adhering to safety precautions to avoid virus transmission. This indicates the positive behavior and attitude of the community towards COVID-19, as a result of better community sensitization.<sup>18</sup> A unique yet encouraging finding reported by our study was that the community members allocated separate rooms and utensils for family members who are working in a hospital 

437 setting. This indicates that most participants in our study had adequate awareness of safety measures438 for preventing exposure to COVID-19.

Commenting on the perceived risk associated with the COVID-19 outbreak, the majority of the participants in this study expressed a high level of susceptibility in contracting COVID-19 as a result of poor adherence to safety measures by some community members. Our study participants notified that the younger generation may inflict damage in the community as safety precautions are not being followed. World Health Organization also confirms that the younger generation is driving COVID-19 spread because symptoms are often milder or none at all in the young people, and many are unaware that they are infected and unknowingly passing on the virus to others<sup>24</sup>. This finding indicates that community mobilization and sensitization activities are still weak and require concentrated efforts to raise awareness and resolve misconceptions that are associated with an increase in COVID-19 cases. In such circumstances, it is recommended that community leadership should set rules and regulations to help individuals avoid behaviors that are no longer considered socially responsible.<sup>22</sup> 

Finally, community members recommended ongoing training and drills to prevent the second wave of the COVID-19 outbreak. A viewpoint by Dzigbede et al reported that local governments should implement disaster training exercises to prepare for the second wave of COVID-19.<sup>25</sup> Such training have the potential to strengthen local response and recovery from the COVID-19 Pandemic.<sup>25</sup> One encouraging finding of the study was that the members of the community recognized that the role of community nursing, and community health centers to prepare for the second wave of COVID-19. This has also been emphasized by Bavel et al in a perspective paper. Since the COVID-19 crisis requires large-scale behavior change, the role of community health sciences and social and behavioral sciences is of utmost value to help align human behaviors with the recommendations of epidemiologists and public health experts.<sup>22</sup> 

Since the study was conducted in the month of May and June 2020, it provides an initial evidence base of communities' perceptions, and attitudes towards COVID-19 in an early stage of the pandemic when the communities just start to learn about the COVID-19 virus. The study data collection period observed an uptick in the daily new COVID-19 cases as well as total deaths perhaps due to the Eid festival<sup>26</sup>. The uptick in the cases might have influenced the community perceptions and attitudes towards COVID-19 and community members might have taken stringent measures to prevent exposure during the surge. The community perceptions and attitudes towards COVID-19 and its precautionary measures may be different at the present time given that the community has acquainted with the current situation. One of the limitations of this study was that all study respondents were interviewed online, to minimize the risk of infection. In online interviews, the authors did not have the opportunity to build rapport with community members over Zoom or obtain non-verbal cues during interviews. Secondly, due to the nature of outbreak prevention, the study was unable to conduct focus group discussions with community members, which would have provided detailed information about personal and group feelings. Besides, the timings of interviews (May-June 2020) is also one of the limitations of this study as the results would have yielded a different picture if participants would have been interviewed in Feb and March 2020, when the pandemic just occurred in Pakistan. Lastly, this was a short-term study and does not involve long-term perceptions of the community members with this pandemic. 

The findings from this study will help tailor existing public health interventions to address the social and behavioral problems related to this pandemic. The findings from this study can be directly used for improving community preparedness and response for possible future COVID-19 waves or other outbreaks. Future research should be directed at developing and implementing contextual interventions to improve community understanding and social responses towards COVID-19. In addition, future research could be conducted to capture any temporal changes in community perceptions and attitudes. especially with respect to vaccinations. 

#### 58 489 Conclusion

490 This study provides an in-depth view of communities' perspectives and attitudes towards the COVID 491 19 pandemic. Generally, community members had good knowledge about COVID-19, and positive

behavior and attitude towards using standard precautions, which is important to prevent exposure to COVID-19. The knowledge is mainly acquired through electronic media, print media, and social media platforms, which have pros and cons. However, some community members including younger individuals had poor adherence to safety measures. This may necessitate concentrated efforts to raise awareness and resolve misconceptions through community mobilization and sensitization activities. The study emphasizes that sufficient knowledge and awareness about COVID-19, adequate training and drills, and adherence to safety measures, are necessary to better prepare for the second wave of COVID-19. Lessons learned from this study are extremely valuable and can be transferable to community settings in Pakistan that have similar socio-demographic characteristics. However, findings cannot be extrapolated to other countries because of the differences in participant demographics and health system constraints.

## Annex-1 In-Depth Interview Guide for interviewing community members

### **Basic Information**

| S.no | Participant<br>Code<br>(Confidential) | Age | Sex | Occupation | Educational<br>level | Locality/site |
|------|---------------------------------------|-----|-----|------------|----------------------|---------------|
|      |                                       |     |     |            |                      |               |
|      |                                       | D.  |     |            |                      |               |
|      |                                       |     |     |            |                      |               |
|      |                                       |     | R   |            |                      |               |

# General Perceptions and attitudes towards COVID-19

- 1. How do you feel about your knowledge level regarding COVID-19 pandemic?
- 2. How did you learn about the coronavirus outbreak?
- 3. What is the reliable source of information about COVID-19?

Probes: social media, television, newspapers/magazines, websites, friends/family, health care professionals

- 4. What were your initial reactions towards COVID-19, when you first heard about it?
  - a. Probes: curse from God etc.
- 5. What are your thoughts and feelings about COVID-19 cases?

# Perceptions on safety measures for preventing COVID-19

 What safety measures have you taken for yourself and for your family safety in COVID-19?

**Probes**: hand washing, sanitizer, social distancing, covering your cough, avoiding touching your eyes, nose, and mouth with unwashed hands, wearing a face mask, avoiding close contact with someone who is sick

### Perceived risks associated with poor adherence to safety measures

- 1. Do you think novel coronavirus will inflict serious damage in your community, if adequate safety measures are not taken?
- 2. Do you think you can protect yourself against the novel coronavirus?

### **Future Preparedness**

1. In your opinion, what are the needs for future preparedness for any outbreak that prepare community (trainings, awareness, equipment, protective gears)

opper to the solution of the s

# Standards for Reporting Qualitative Research (SRQR)\*

http://www.equator-network.org/reporting-guidelines/srqr/

Page/line no(s).

| Title - Concise description of the nature and topic of the study Identifying the |                 |
|--|-----------------|
| study as qualitative or indicating the approach (e.g., ethnography, grounded     | Pape no. 1/line |
| theory) or data collection methods (e.g., interview, focus group) is recommended | no. 1-2         |
| Abstract - Summary of key elements of the study using the abstract format of the |                 |
| intended publication; typically includes background, purpose, methods, results,  | Pape no. 2/line |
| and conclusions  | no. 32-58       |

# Introduction

| Problem formulation - Description and significance of the problem/phenomenon   | Pape no. 4/line |
|--|-----------------|
| studied; review of relevant theory and empirical work; problem statement       | no. 124-127     |
| Purpose or research question - Purpose of the study and specific objectives or | Pape no. 4/line |
| questions  | no. 116-120     |

# Methods

| Qualitative engranch and research never light Qualitative engranch (a.g.                  |                               |
|---|-------------------------------|
| Qualitative approach and research paradigm - Qualitative approach (e.g.,                  |                               |
| ethnography, grounded theory, case study, phenomenology, narrative research)              |                               |
| and guiding theory if appropriate; identifying the research paradigm (e.g.,               | Pape no. 4/li                 |
| postpositivist, constructivist/ interpretivist) is also recommended; rationale**          | no. 125-127                   |
|   |                               |
| <b>Researcher characteristics and reflexivity</b> - Researchers' characteristics that may |                               |
| influence the research, including personal attributes, qualifications/experience,         |                               |
| relationship with participants, assumptions, and/or presuppositions; potential or         |                               |
| actual interaction between researchers' characteristics and the research                  | Pape no. 6/li                 |
| questions, approach, methods, results, and/or transferability                             | no. 206-210                   |
|   | Pape no. 4 &                  |
|   | 5/line no. 129                |
| Context - Setting/site and salient contextual factors; rationale**                        | 142                           |
| Sampling strategy - How and why research participants, documents, or events               |                               |
| were selected; criteria for deciding when no further sampling was necessary (e.g.,        | Pape no. 4/li                 |
| sampling saturation); rationale**   | no. 125                       |
|   |                               |
| Ethical issues pertaining to human subjects - Documentation of approval by an             |                               |
| appropriate ethics review board and participant consent, or explanation for lack          | Pape no. 6/li                 |
| thereof; other confidentiality and data security issues                                   | no. 191-193                   |
|   |                               |
| Data collection methods - Types of data collected; details of data collection             |                               |
|   | Pape no. 5-                   |
| Data collection methods - Types of data collected; details of data collection             | Pape no. 5-<br>6/line no. 144 |

| <b>Data collection instruments and technologies</b> - Description of instruments (e.g., interview guides, questionnaires) and devices (e.g., audio recorders) used for data collection; if/how the instrument(s) changed over the course of the study | Pape no. 6<br>6/line no. 15<br>189  |
|---|-------------------------------------|
| <b>Units of study</b> - Number and relevant characteristics of participants, documents, or events included in the study; level of participation (could be reported in results)  | Pape no. 6-<br>7/line no. 22<br>225 |
| <b>Data processing</b> - Methods for processing data prior to and during analysis, including transcription, data entry, data management and security, verification of data integrity, data coding, and anonymization/de-identification of excerpts    | Pape no. 6/<br>no. 195-204          |
| <b>Data analysis</b> - Process by which inferences, themes, etc., were identified and developed, including the researchers involved in data analysis; usually references a specific paradigm or approach; rationale**                                 | Pape no. 6/<br>no. 195-204          |
| <b>Techniques to enhance trustworthiness</b> - Techniques to enhance trustworthiness and credibility of data analysis (e.g., member checking, audit trail, triangulation); rationale**  | Pape no. 6/l<br>no. 206-210         |

### **Results/findings**

| <b>Synthesis and interpretation</b> - Main findings (e.g., interpretations, inferences, and themes); might include development of a theory or model, or integration with prior research or theory | Pape no. 6-<br>9/line no. 213-<br>376 |
|---|---------------------------------------|
| Links to empirical data - Evidence (e.g., quotes, field notes, text excerpts, photographs) to substantiate analytic findings  | Pape no. 6-<br>9/line no. 213-<br>376 |
| cussion   |                                       |

### Discussion

| Integration with prior work, implications, transferability, and contribution(s) to<br>the field - Short summary of main findings; explanation of how findings and<br>conclusions connect to, support, elaborate on, or challenge conclusions of earlier |                  |
|---|------------------|
|   |                  |
| conclusions connect to support elaborate on or challenge conclusions of earlier   |                  |
| conclusions connect to, support, elaborate on, or chanenge conclusions of earlier   | Pape no. 9-      |
| scholarship; discussion of scope of application/generalizability; identification of   | 11/line no. 381- |
| unique contribution(s) to scholarship in a discipline or field  | 487              |
|   | Pape no. 11/line |
| Limitations - Trustworthiness and limitations of findings   | no. 463-479      |

Other

| <b>Conflicts of interest</b> - Potential sources of influence or perceived influence on study conduct and conclusions; how these were managed | Pape no. 13/line<br>no. 527-528     |
|---|-------------------------------------|
| <b>Funding</b> - Sources of funding and other support; role of funders in data collection, interpretation, and reporting                      | Pape no.<br>13/line no. 530-<br>531 |

\*The authors created the SRQR by searching the literature to identify guidelines, reporting standards, and critical appraisal criteria for qualitative research; reviewing the reference lists of retrieved sources; and contacting experts to gain feedback. The SRQR aims to improve the transparency of all aspects of qualitative research by providing clear standards for reporting qualitative research.

#### **BMJ** Open

\*\*The rationale should briefly discuss the justification for choosing that theory, approach, method, or technique rather than other options available, the assumptions and limitations implicit in those choices, and how those choices influence study conclusions and transferability. As appropriate, the rationale for several items might be discussed together.
