

Supplementary Materials

Study Populations

The study includes individuals who participated in large case/control GWAS that were genotyped at or reported to the National Cancer Institute's Cancer Genomics Research Laboratory. GWAS data from 10 studies were obtained from different Illumina SNP genotyping arrays, including cases/controls of bladder cancer from 4 studies totaling 3,100 cases and 8,278 controls (1), brain cancer from 3 studies totaling 478 cases and 6516 controls (2), breast cancer from 2 studies totaling 1071 cases and 1325 controls (3), colon cancer from 2 studies totaling 122 cases and 6094 controls (4), endometrial cancer from 2 studies totaling 940 cases and 887 controls (5), kidney cancer from 3 studies totaling 1566 cases and 7056 controls (6), lung cancer from 3 studies totaling 4938 cases and 8086 controls (7), ovarian cancer from 1 study totaling 535 cases and 815 controls (8), pancreatic cancer from 2 studies totaling 425 cases and 6094 controls (9), prostate cancer from 2 studies totaling 5872 cases and 5279 controls (10), skin cancer from 2 studies totaling 99 cases and 6904 controls, and testicular cancer from one study totaling 531 cases and 637 controls (11). Some individuals were included as controls in multiple GWAS and, in total, there were 12,873 unique individuals included as controls. We only included individuals with European ancestry, totaling 17,693 cases and 11,650 unique controls in the analysis.
