Supplemental information

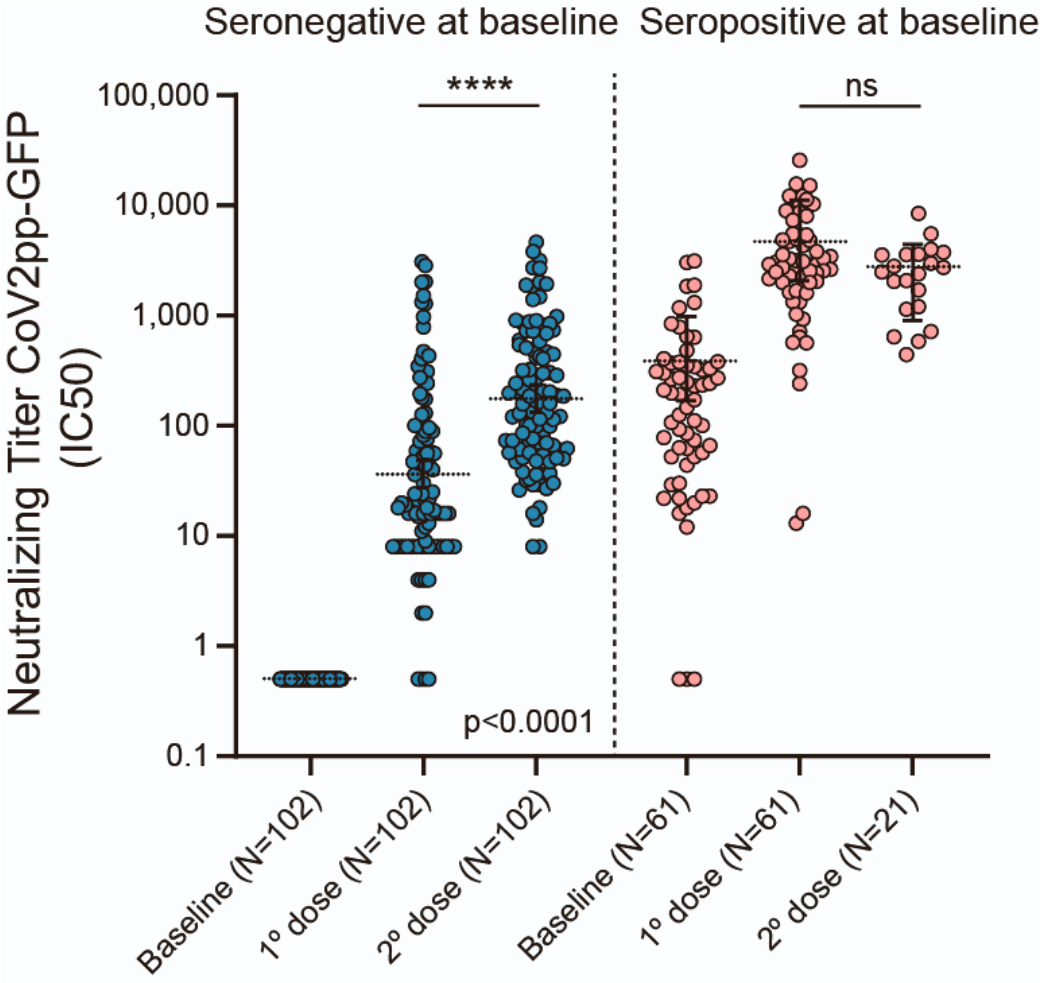

Figure S1 Neutralizing capacity with and without prior SARS-CoV-2 infection after one and two doses of Sputnik V vaccine. Neutralizing titers were measured by 50% inhibition for the pseudotyped virus (CoV2pp-GFP) in 232 participants. Titers at baseline, and 21 days after 1 or 2 doses from individuals that were seronegative or seropositive at baseline are shown. Geometric means with 95% confidence intervals are shown in dash lines The Mann-Whitney *U* test was used to compare at various time points antibody titers. Statistical significance is shown with the following notations: ****:$p < 0.0001$; ns: not significant. Related to Figure 2.
