Supplemental information

**Dorsal clock neurons in *Drosophila* sculpt
locomotor outputs but are dispensable
for circadian activity rhythms**

Ella A. Nettnin, Thomas R. Sallese, Anita Nasser, Sumit Saurabh, and Daniel J. Cavanaugh

Figure S1. Intersectional Genetic Strategy Comprehensively Labels DN1p Cells, Related to Figure 2

(A) Representative maximum projection confocal image of the dorsal region of a DN1p Flip-In brain co-stained for mCherry (red; top left) Kir2.1^{eGFP} (green; middle left), and PER (cyan; bottom left). A merged image is shown on the right. Note that all PER⁺ DN1p cells are labeled with Kir2.1^{eGFP}, confirming that our intersectional approach comprehensively labels DN1p cells. There are additionally 2 GFP⁺ cells (marked by asterisks) which are not co-labeled by PER. In this brain, mCherry labels 2 DN1a cells, which are also PER⁺. (B) Representative maximum projection confocal image of the dorsal region a DN1p Flip-Out brain co-stained for mCherry (red; top left) Kir2.1^{eGFP} (green; middle left), and PER (cyan; bottom left). A merged image is shown on the right. All PER⁺ DN1p cells are co-labeled with mCherry, indicating efficient and comprehensive recombination in DN1p cells. There are also 2 mCherry⁺ cells (marked by asterisks) which are not PER⁺. (C-D) Representative maximum projection confocal images of the ventrolateral region of DN1p Flip-In (C) and Flip-Out (D) brains co-stained for mCherry (red; top left) Kir2.1^{eGFP} (green; middle left), and PER (cyan; bottom left). Note that the Flip-In and Flip-Out approaches label a single PER⁻ cell (indicated by the arrow) in the vicinity of the LN_d clock neurons. This cell is Kir2.1^{eGFP}⁺ in the Flip-In brain (C) and mCherry⁺ in the Flip-Out brain (D).

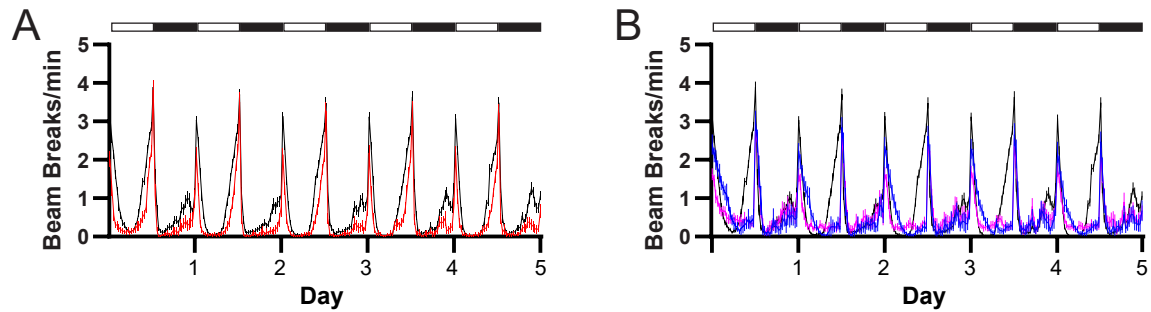

Figure S2. Kir2.1^{eGFP} Expression in DN1p Cells Reduces Overall Activity Levels Without Affecting Anticipatory Activity in Light-Entrained Conditions, Related to Figure 5

(A) Mean number of DAM beam breaks/min (\pm 95% confidence interval) is plotted over 5 days in LD conditions for DN1p Flip-in Flies (red) compared to control flies (black). (B) Mean DAM beam breaks/min is plotted as in (A) for DN1p Flip-Out flies (blue), flies in which all Clk856+ clock neurons are silenced with Kir2.1^{eGFP} (pink), and control flies (black). The same control data are graphed in (A) and (B) and consists of a combination of 3 control lines lacking Kir2.1^{eGFP} expression (see Methods). White and black bars indicate light and dark periods, respectively. Note that DN1p Flip-In flies have reduced activity levels compared to controls during both the day and night, but retain morning and evening anticipatory activity (ramping up activity prior to light transitions).

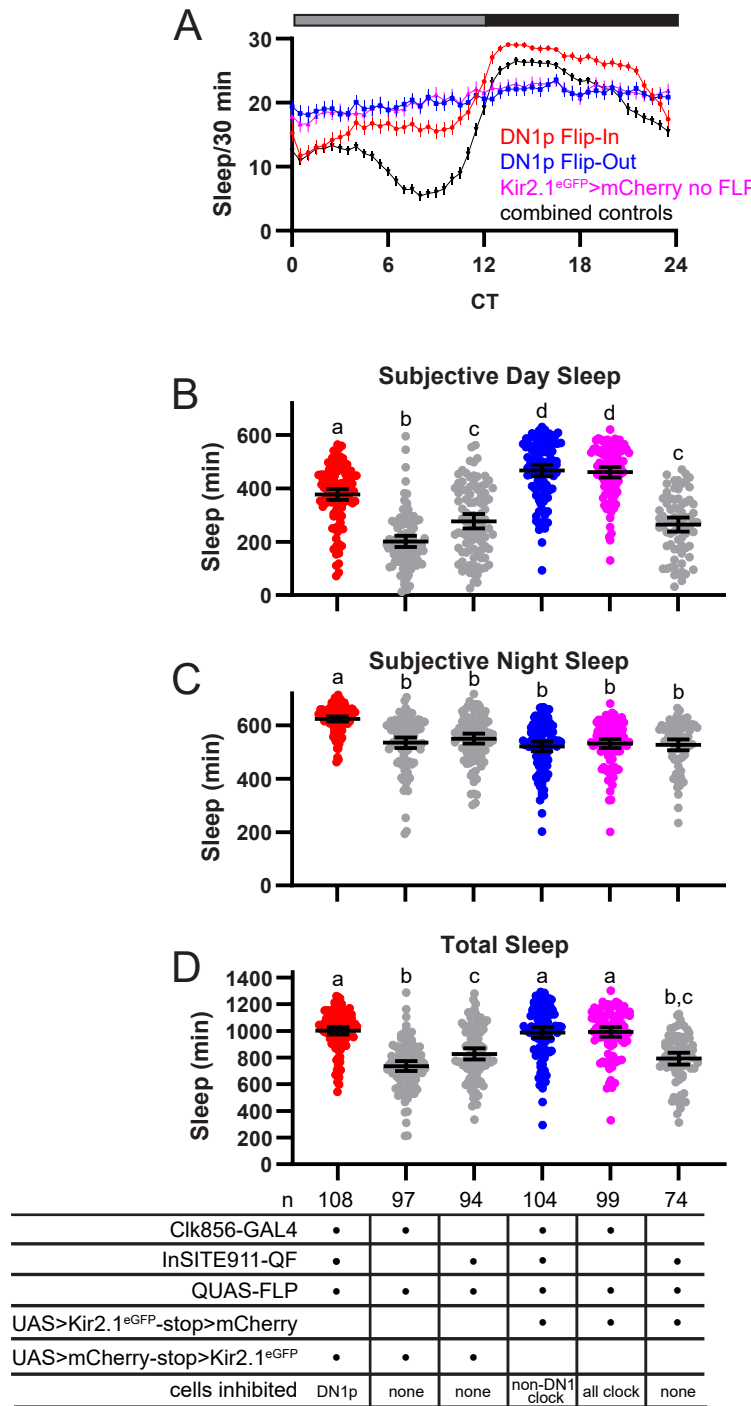

Figure S3. Kir2.1^{eGFP} Expression in DN1p Cells Increases Sleep Duration in DD Conditions, Related to Figure 6

(A) Mean sleep/30 min (\pm 95% confidence interval) over the course of a 24-hr day is plotted for DN1p Flip-In flies (red), DN1p Flip-Out flies (blue), flies in which all Clk856-GAL4+ clock cells are silenced (pink), and control flies (black). Control plot consists of data from a combination of 3 control lines lacking Kir2.1^{eGFP} expression (see Methods). Data are averaged over 5 days in DD conditions. Grey and black bars indicate subjective day and subjective night, respectively. (B-D) Total subjective day, subjective night, or 24-hr sleep is plotted for the indicated genotypes. Lines are means \pm 95% confidence intervals. Dots represent individual flies. Different letters indicate significant difference ($p < 0.05$), Tukey's multiple comparisons test following one-way ANOVA. The same letter indicates no significant different ($p > 0.05$).

Figure S4. *Kir2.1^{GFP}* Expression in DN1a Cells Prolongs Evening Anticipatory Activity and Enhances Morning Anticipatory Activity in Light-Entrained Conditions, Related to Figure 9

(A) Mean number of DAM beam breaks/min (\pm 95% confidence interval) is plotted over 5 days in LD conditions for experimental flies with *spl-DN1a-GAL4*-driven expression of *Kir2.1^{GFP}* (green) and control flies with *spl-DN1a-GAL4*-driven *mCherry* (black). Note that silencing of DN1a cells causes prolonged evening anticipatory activity (preceding lights-off), starting earlier in the evening than control flies, and also increases the slope and magnitude of morning anticipatory activity (preceding lights-on).

B Subjective Day Sleep

C Subjective Night Sleep

D Total Sleep

	n	93	93
spl-DN1a-GAL4	•	•	
UAS>Kir2.1 ^{eGFP-stop} >mCherry	•		
UAS>mCherry-stop>Kir2.1 ^{eGFP}			•

Figure S5. Kir2.1^{eGFP} Expression in DN1a Cells Decreases Sleep Duration in DD Conditions, Related to Figure 10

(A) Mean sleep/30 min (\pm 95% confidence interval) over the course of a 24-hr day is plotted for flies with spl-DN1a-GAL4-driven expression of Kir2.1^{eGFP} (green) and control flies with spl-DN1a-GAL4-driven mCherry (black). Data are averaged over 5 days in DD conditions. Grey and black bars indicate subjective day and night, respectively. (B-D) Total daytime, nighttime, or 24-hr sleep is plotted for the indicated genotypes. Lines are means \pm 95% confidence intervals. Dots represent individual flies. **** p < 0.0001, t-test.
